UNIT 1 PRINCIPLES OF MANAGEMENT

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- understand the history of management thoughts;
- appreciate the benefits and principles of management;
- understand management as science and art and both; and
- the relevance of principles of management in an organisation.

1.1 INTRODUCTION

Organisations and the Need for Management

For most of our lives, we are members of one organisation or another—a college, a sports team, a musical or theatrical group, a religious or civic organisation, a branch of the armed forces, or a business. Some organisations, like the army and large corporations, are structured very formally. Others, like a neighbourhood bridge team as neighbourhood car theft prevention committee, are more casually structured. But all organisations, formal or informal, are put together and kept together by a group of people who see that there are benefits available from working together toward some common goal. So a very basic element of any organisation is a goal or purpose. The

goal will vary—to win a league championship, to entertain an audience, to sell a product—but without a goal no organisation would have a reason to exist.

All organisations also have some programme or method for achieving goals and plan. The plan might be to practice playing skills, to rehearse a certain number of times before each performance, or to manufacture and advertise a product. Whatever it is, without some plan for what it must do, no organisation is likely to be very effective.

Organisations must also acquire and allocate the resources necessary to achieve their goals. Perhaps a playing field or rehearsal hall must be available, or money must be budgeted for wages. All organisations depend on other organisations for the resources they need. A team cannot play without the required equipment; manufacturers must maintain contracts with suppliers. XYZ hospital, in south Delhi for example, depends on medicine suppliers, suppliers of many different types of equipment, and also on good medical colleges for supply of good doctors.

Management Organisations

Management is the practice of consciously and continually shaping organisations. All organisations have people who are responsible for helping them achieve their goals. These people are called managers. These managers—coaches, conductors, sales executives, superintendent—may be more obvious in some organisations than in others, but without effective management, organisations are likely to get into difficulties.

1.2 WHY STUDY MANAGEMENT THEORY?

Theories are perspective with which people make sense of their world experiences. Formally, a theory is a coherent group of assumptions put forth to explain the relationship between two or more observable facts.

First, theories provide a stable focus for understanding what we experience. A theory provides criteria for determining what is relevant. To an entrepreneur, who is in the business of building roads, may theorize that a large and compliant workforce is relevant factor for his business. In other words, his theory of management included, among other things, this assumption about the supply of labour.

Second, theories enable us to communicate efficiently and thus move into more and more complex relationships with other people. Imagine the frustration the road builder would encounter if, in dealing with other people, he always had to define even the most basic assumptions he makes about the world in which he lives! Because he and his managers fully understood his theory about building roads, they could interact easily as they faced day-to-day challenges.

Third, theories make it possible—indeed, challenge us—to keep learning about our world. By definition, theories have boundaries; there is only so much that can be covered by any one theory. Once we are aware of this, we are better able to ask ourselves if there are alternative ways of looking at the world (especially when our theories no longer seem to fit our experience) and to consider the consequences of adopting alternative beliefs.

1.3 THE SCIENTIFIC MANAGEMENT SCHOOL

Scientific Management theory arose in part from the need to increase productivity. In the United States especially, skilled labour was in short supply at the beginning of the twentieth century. To expand the productivity Frank and Lillian Gilbreth devised the body of principles known as scientific management theory.

Frederick W. Taylor

Frederick W. Taylor (1956-1915) rested his philosophy on four basic principles:

1) *The development of a true science of management*, so that the best method for performing each task could be determined.

2) *The scientific selection of workers*, so that each worker would be given responsibility for the task for which he or she was best suited.

3) *The scientific* education and development of the worker.

4) *Intimate, friendly cooperation between management and labour.*

Taylor contended that the success of these principles required a complete mental revolution on the part of management and labour. Rather than quarrel over profits, both sides should try to increase production; by so doing, he believed, profits would rise to such an extent that labour and management would no longer have to fight over them. In short, Taylor believed that management and labour had a common interest in increasing productivity.

Taylor based his management system on production-line time studies. Instead of relying on traditional work methods, he analysed and timed steel worker's movements on a series of jobs. Using time study as his base, he broke each job down into its components and designed the quickest and best methods of performing each component. In this way he established how much workers should be able to do with the equipment and materials at hand. He also encouraged employers to pay more productive workers at a higher rate than others, using a scientifically correct rate that would benefit both company and worker. Thus, workers were urged to surpass their previous performance standards to earn more pay. Taylor called his plan the **differential rate system.**

Contributions of Scientific Management Theory

The modern assembly line pours out finished products faster than Taylor could ever have imagined. This production "miracle" is just one legacy of scientific management. In addition, its efficiency techniques have been applied to many tasks in non-industrial organisations, ranging from fast-food service to the training of surgeons.

1.4 CLASSICAL ORGANISATION THEORY SCHOOL

Scientific management was concerned with increasing the productivity of the shop and the individual worker. **Classical organisation theory** grew out of the need to find guidelines for managing such complex organisations as factories.

Henry Fayol

Henry Fayol (1981-1925) is generally hailed as the founder of the classical management school, not because he was the first to investigate managerial behaviour, but because he was the first to systematize it. Fayol believed that sound management practice falls into certain patterns that can be identified and analysed. From this basic insight, he drew up a blueprint for a cohesive doctrine of management, one that retains much of its force to this day.

While Taylor was basically concerned with organisational functions, however, Fayol was interested in the total organisation and focused on management, which he felt had been the most neglected of business operations. Before Fayol, it was generally believed that managers are born, not made. Fayol insisted, however, that management was a skill like any other one that could be taught once its underlying principles were understood.

Max Weber

Reasoning that any goal-oriented organisation consisting of thousands of individuals would require the carefully controlled regulation of its activities, the German sociologist Max Weber (1864-1920) developed a theory of bureaucratic management that stressed the need for a strictly defined hierarchy governed by clearly defined regulations and lines of authority. He considered the ideal organisation to be a **bureaucracy** whose activities and objectives were rationally thought out and whose divisions of labour were explicitly spelled out. Weber also believed that technical competence should be emphasized and that performance evaluations should be made entirely on the basis of merit.

Today we often think of bureaucracies as vast, impersonal organisations that put

impersonal efficiency ahead of human needs. We should be careful, though, not to apply our negative connotations of the word bureaucracy to the term as Weber used it. Like the scientific management theorists, Weber sought to improve the performance of socially important organisations by making their operations predictable and productive. Although we now value innovation and flexibility as much as efficiency and predictability, Weber's model of bureaucratic management clearly advanced the formation of huge corporations such as Ford. Bureaucracy was a particular pattern of relationships for which Weber saw great promise.

Although bureaucracy has been successful for many companies, in the competitive global market of the 1990s organisations such as General Electric and Xerox have become bureaucracy busters, throwing away the organisation chart and replacing it with ever-changing constellations of teams, projects, and alliances with the goal of unleashing employee creativity.

Mary Parker Follett

Mary Parker Follett (1868-1933) was among those who built on the basic framework of the classical school. However, she introduced many new elements, especially in the area of human relations and organisational structure. In this, she initiated trends that would be further developed by the emerging behavioural and management science schools.

Follett was convinced that no one could become a whole person except as a member of a group; human beings grew through their relationships with others in organisations. In fact, she called management the art of getting things done through people. She took for granted Taylor's assertion that labour and management shared a common purpose as members of the same organisation, but she believed that the artificial distinction between managers (order givers) and subordinates (order takers) obscured this natural partnership. She was a great believer in the power of the group, where individuals could combine their diverse talents into something bigger. Moreover, Follett's holistic model of control took into account not just individuals and groups, but the effects of such environmental factors as policies, economics, and biology.

Follett's model was an important forerunner of the idea that management meant more than just what was happening inside a particular organisation. By explicitly adding the organisational environment to her theory, Follett paved the way for management theory to include a broader set of relationships, some inside the organisation and some across the organisation's borders. A diverse set of modern management theories pays homage to Follett on this point.

1.5 THE BEHAVIOURAL SCHOOL: THE ORGANISATION IS PEOPLE

The **Behavioural school** emerged partly because the classical approach did not achieve sufficient production efficiency and workplace harmony. To managers' frustration, people did not always performed according to predicted or expected patterns of behavior. Thus there was increased interest in helping managers' deal more effectively with the people side of their organisations. Several theorists tried to strengthen classical organisation theory with the insights of sociology and psychology.

Organisational behaviour, commonly referred to as OB, is an interdisciplinary field dedicated to better understanding and managing people at work. By definition organisational behaviour is both research and application oriented. Three basic levels of analysis in OB are individual, group, and organisational. OB draws upon a diverse array of disciplines, including psychology, management, sociology, organisation theory, social psychology, statistics, anthropology, general systems theory, economics, information technology, political science, vocational counseling, human stress management, psychometrics, ergonomics, decision theory, and ethics. This rich heritage has spawned many competing perspectives and theories about human work behaviour. By the mid-1980s, one researcher had identified 110 distinct theories about behaviour within the field of OB.

Organisational behaviour is an academic designation. With the exception of teaching/

research positions, OB is not an everyday job category such as accounting, marketing, or finance. Students of OB typically do not get jobs in organisational behavior, per se. This reality in no way demeans OB or lessens its importance in effective organisational management. OB is a horizontal discipline that cuts across virtually every job category, business function, and professional speciality. Anyone who plans to make a living in a large or small, public or private, organisation needs to study organisational behaviour.

A historical perspective of the study of people at work helps in studying organisational behaviour. According to a management history expert, this is important because Historical perspective is the study of a subject in light of its earliest phases and subsequent evolution. Historical perspective differs from history in that the object of historical perspective is to sharpen one's vision of the present, not the past.

In other words, we can better understand where the field of OB is today and where it appears to be headed by appreciating where it has been. Let us examine three significant landmarks in the evolution of understanding and managing people:

1) The human relations movement.

2) The total quality management movement.

3) The contingency approach to management

1.6 THE HUMAN RELATIONS MOVEMENT

A unique combination of factors during the 1930s fostered the human relations movement. First, following legalization of union-management collective bargaining in the United States in 1935, management began looking for new ways of handling employees. Second, behavioural scientists conducting on-the-job research started calling for more attention to the human factor. Managers who had lost the battle to keep unions out of their factories heeded the call for better human relations and improved working conditions. One such study, conducted at Western Electric's Chicago-area Hawthorne plant, was a prime stimulus for the human relations movement. Ironically, many of the Hawthorne findings have turned out to be more myth than fact.

The Hawthorne Legacy: Interviews conducted decades later with three subjects of the Hawthorne studies and reanalysis of the original data with modern statistical techniques do not support initial conclusions about the positive effect of supportive supervision. Specifically, money, fear of unemployment during the Great Depression, managerial discipline, and high-quality raw materials—not supportive supervision—turned out to be responsible for high output in the relay assembly test room experiments. Nonetheless, the human relations movement gathered momentum through the 1950s, as academics and managers alike made stirring claims about the powerful impact that individual needs, supportive supervision, and group dynamics apparently had on job performance.

The Writings of Mayo and Follett: Essential to the human relations movement were the writings of Elton Mayo and Mary Parker Follett. Australian-born Mayo, who headed the Harvard researchers at Hawthorne, advised managers to attend to employee's emotional needs in his 1933 classic, The Human Problems of an Industrial Civilisation. Follett was a true pioneer, not only as a woman management consultant in the male-dominated industrial world of the 1920s, but also as a writer who saw employees as complex combinations of attitudes, beliefs, and needs. Mary Parker Follett was way ahead of her time in telling managers to motivate job performance instead of merely demanding it, a pull rather than push strategy. She also built a logical bridge between political democracy and a cooperative spirit in the workplace.

McGregor's Theory Y: In 1960, Douglas McGregor wrote a book entitled The Human Side of Enterprise, which has become an important philosophical base for the modern view of people at work. Drawing upon his experience as a management consultant, McGregor formulated two sharply contrasting sets of assumptions about human nature (see Table 1.1). His Theory X assumptions were pessimistic and negative and, according to McGregor's interpretation, typical of how managers traditionally perceived employees. To help managers break with this negative tradition, McGregor formulated his **Theory Y**, a modern and positive set of assumptions about people. McGregor

believed managers could accomplish more through others by viewing them as self-energised, committed, responsible, and creative beings.

A survey of 10,227 employees from many industries across the United States challenges managers to do a better job of acting on McGregor's Theory Y assumptions. From the employees' perspective, Theory X management practices are the major barrier to productivity improvement and employee wellbeing. The researcher concluded:

The most noteworthy finding from their survey is that an overwhelming number of American workers—some 97 per cent—desire work conditions known to facilitate high productivity. Workers uniformly reported—regardless of the type or organisation, age, gender, pay schedule, or level in the organisational hierarchy—that they needed and wanted in their own workplaces the conditions for collabouration, commitment, and creativity research has demonstrated as necessary for both productivity and health. Just as noteworthy, however, is the finding that the actual conditions of work supplied by management are those conditions that research has identified as *competence suppressors'* procedures, policies, and practices that prevent or punish expressions of competence and most characterise unproductive organisations.

Table 1.1: McGregor's Theory X and Theory Y

Outdated (Theory X) Assumptions about people at work	Modern Theory (Y) Assumptions about people at work
1) Most people dislike work; they avoid it when they can.	1) Work is a natural activity, like play or rest.
2) Most people must ge coerced and threatened with punishment before they will work. People require close direction when they are working.	2) People are capable of self-direction and self-control if they are committed to objectives.
3) Most people actually prefer to be directed. They tend to avoid responsibility and exhibit little ambition. They are interested only in security.	3) People generally become committed to organisational objectives if they are rewarded for doing so.
	4) The typical employee can learn to accept and seek responsibility.
	5) The typical member of the general population has imagination, ingenuity, and creativity.

New Assumptions about Human Nature: Unfortunately, unsophisticated behavioural research methods caused the human religionists to embrace some naïve and misleading conclusions. For example, human religionists believed in the axiom, "A satisfied employee is a hardworking employee". Subsequent research, as discussed later in this book, shows the satisfaction performance linkage to be more complex than originally thought.

Despite its shortcomings, the human relations movement opened the door to more progressive thinking about human nature. Rather than continuing to view employees as passive economic beings, managers began to see them as active social beings and took steps to create more humane work environments.

1.7 THE TOTAL QUALITY MANAGEMENT MOVEMENT

A great deal has been written and said about quality in recent years. So much, in fact, that total quality management (TQM) has been dismissed by some as just another fad. Yet **TQM** programmes are alive and well in the workplace. Training magazine's 1995 survey of US companies with 100 or more employees found 58 per cent of them pursuing **TQM** initiatives (more than any other type of programme). Similar has been the trend in India disregarding the underlying principles of TQM because of apparent faddishness would be unwise as ignoring sound nutrition and exercise guidelines because of endless discussions about dieting, **TQM** principles have profound practical implications for managing people today.

What is TQM? TQM means that the organisation's culture is defined by and supports the constant attainment of customer satisfaction through an integrated system of tools,

techniques, and training. This involves the continuous improvement of organisational processes, resulting in high quality products and services.

Quality consultant Richard J. Schonberger sums up TQM as "continuous, customer-centered, employee-driven improvement." TQM is necessarily employee driven because product/service quality cannot be continuously improved without the active learning and participation of every employee. Thus, in successful quality improvement programmes, TQM principles are embedded in the organisation's culture.

The Deming Legacy: TQM is firmly established today thanks in large part to the pioneering work of W. Edwards Deming. Ironically, the mathematician credited with Japan's post-World War II quality revolution rarely talked in terms of quality. He instead preferred to discuss good management during the hard-hitting seminars he delivered right up until his death at age 93 in 1993. Although Deming's passion was the statistical measurement and reduction of variations in industrial process, he had much to say about how employees should be treated. Regarding the human side of quality improvement, Deming called for the following:

- Formal training in statistical process control techniques and teamwork.
- Helpful leadership, rather than order giving and punishment.
- Elimination of fear so employees will feel free to ask questions.
- Emphasis on continuous process improvements rather than on numerical quotas.
- Teamwork.
- Elimination of barriers to good workmanship.

One of Deming's most enduring lessons for managers is his 85-15 rule. Specifically, when things go wrong, there is roughly an 85% chance the system (including management, machinery, and rules) is at fault. Only about 15% of the time is the individual employee at fault. Unfortunately, as Deming observed, the typical manager spends most of his or her time wrongly blaming the punishing individuals for system failures. Statistical analysis is required to uncover system failures.

Principles of TQM: Despite variations in the language and scope of TQM programmes, it is possible to identify four common TQM principles:

1) Do it right the first time to eliminate costly rework.
2) Listen to and learn from customers and employees.
3) Make continuous improvement on every day matter.
4) Build teamwork, trust, and mutual respect.

Deming's influence is clearly evident in this list. Once again, as with the human relations movement, we see people as the key factor in organisational success.

In summary, TQM advocates have made a valuable contribution to the field of OB by providing a practical context for managing people. When people are managed according to TQM principles, everyone is more likely to get the employment opportunities and high-quality goods and services they demand.

1.8 THE CONTINGENCY APPROACH

Scholars have wrestled for many years with the problem of how best to apply the diverse and growing collection of management tools and techniques. Their answer is the contingency approach. The **contingency approach** calls for using management techniques in a situationally appropriate manner, instead of trying to rely on one best way. According to a pair of contingency theorists:

Contingency theories developed and their acceptance grew largely because they responded to criticisms that the classical theories advocated one best way of organising and managing. Contingency theories, on the other hand, proposed that the appropriate organisational structure and management style were dependent upon a set of contingency factors, usually the uncertainty and instability of the environment.

The contingency approach encourages managers to view organisational behaviour within a situational context. According to this modern perspective, evolving situations, no hard-and-fast rules, determine when and where various management techniques are appropriate. For example, contingency researchers have determined that there is no single best style of leadership. Organisational behaviour specialists embrace the contingency approach because it helps them realistically interrelate individuals, groups, and organisations. Moreover, the contingency approach sends a clear message to managers in today's global economy. Carefully read the situation and then be flexible enough to adapt.

1.9 THE MANAGEMENT SCIENCE SCHOOL

At the beginning of World War II, Great Britain desperately needed to solve a number of new, complex problems in warfare. With their survival at stake, the British formed the first operational research (OR) teams. By pooling the expertise of mathematicians, physicists, and other scientists in OR teams, the British were able to achieve significant technological and tactical breakthroughs. When the Americans entered the war, they formed what they called operations research teams, based on the successful British model, to solve similar problems. The teams used early computers to perform the thousands of calculations involved in mathematical modeling.

When the war was over, the applicability of operations research to problems in industry gradually became apparent. New industrial technologies were being put into use and transportation and communication were becoming more complicated. These developments brought with them a host of problems that could not be solved easily by conventional means. Increasingly, OR specialists were called on to help managers come up with answers to these new problems. Over the years, OR procedures were formalized into what is now more generally called the management science school.

1.10 THE SYSTEMS APPROACH

Rather than dealing separately with the various segments of an organisation, the **systems approach** to management views the organisation as a unified, purposeful system composed of interrelated parts. This approach gives managers a way of looking at the organisation as a whole and as a part of the larger, external environment. Systems theory tells us that the activity of any segment of an organisation affects, in varying degrees the activity of every other segment.

Activity

1) Visualise your organisation as a system and list the critical sub-systems within it. Note down various flows between these sub-systems which interlink them.

.....

.....

.....

.....

.....

.....

2) Visualise your organisation as a sub-system of the environment and decribe the interaction between the two.

1.11 RECENT DEVELOPMENTS IN MANAGEMENT THEORY

Theories are powerful influences. The longer we use a given theory, the more comfortable we become with it and the more we tend to not seek out alternative theories unless events force us to change. This helps explain why modern management theory is really a rich mosaic of many theories that have endured over at least the past century. One benefit of understanding this concurrent popularity of many points of view about organisations is that it prepares you for your own organisational experiences. If this unit has not already brought to mind different managerial principles to which you have been exposed, it will prepare you for the day when, for example, you work for a management science manager who in turn works for a manager who practices some other theories to follow. Or if you have already experienced such managers, it will help you understand their perspectives better.

1.12 PRINCIPLES OF MANAGEMENT

Observational studies by Mintzberg and others have found the typical manager's day to be a fragmented collection of brief episodes. Interruptions are commonplace, while large blocks of time for planning and reflective thinking are not. In one particular study, four top-level managers spent 63% of their time on activities lasting less than a hour. But what specific skills do effective managers perform during their hectic and fragmented workdays?

Many attempts have been made over the years to paint a realistic picture of what managers do. Diverse and confusing lists of managerial functions and roles have been suggested. Fortunately, a stream of research over the past 20 years by Clark Wilson and others has given us a practical and statistically validated profile of managerial skills (see Table 1.2). Wilson's managerial skills profile focuses on 11 observable categories of managerial behaviour. This emphasis on skills is very much in tune with today's result-oriented organisations. Indeed, Wilson's unique skills-assessment technique goes beyond the usual self-support approach with its natural bias. In addition to surveying a given manager about his or her 11 skills, the Wilson approach also asks those who report directly to the manager to answer questions about their boss's skills.

Table 1.2: Skills Exhibited by an Effective Manager

- Clarifies goals and objectives for everyone involved.
- Encourages participation, upward communication, and suggestions.
- Plans and organises for an orderly workflow.
- Has technical and administrative expertise to answer organisation-related questions.
- Facilitates work through team building, training, coaching, and support.
- Provides feedback honestly and constructively.
- Keeps things moving by relying on schedules, deadlines, and helpful reminders.
- Controls details without being overbearing.
- Applies reasonable pressure for goal accomplishment.
- Empowers and delegates key duties to others while maintaining goal clarity and commitment.
- Recognizes good performance with rewards and positive reinforcement.

According to Wilson and his colleagues, the result is an assessment of skills mastery, not simply skill awareness. The logic behind Wilson's approach is both simple and compelling. Who better assess a manager's skills than the people who experience those behaviours on a day-to-day basis those who report directly to the manager?

The Wilson managerial skills research yields three useful lessons:

1) Dealing effectively with people is what management is all about. The 11 skills in Table 1.2 constitute creation/commitment/feedback/reward/accomplishment cycle with human interaction at every turn.

2) Managers with high skills mastery tend to have better submit performance and employee morale than managers with low skills mastery.

3) Effective female and male managers do not have significantly different skill profiles, contrary to claims in the popular business press in recent years.

1.13 21st CENTURY MANAGERS

Today's workplace is indeed undergoing immense and permanent changes. Organisations are being engineered for greater speed, efficiency, and flexibility. Teams are pushing aside the individual as the primary building block of organisations. Command-and-control management is giving way to participative management and empowerment. Customer-centred leaders are replacing ego-centred leaders. Employees increasingly are being viewed as internal customers. All this creates a mandate for a new kind of manager in the 21st century. Table 1.3 contrasts the characteristics of past and future managers.

Table 1.3: Evolution of the 21st Century Manager

	Past Managers	Future Managers
Primary Role	Order giver, privileged elite, manipulator, controller	Facilitator, team member, teacher, advocate, sponsor, coach
Learning and Knowledge	Period learning, narrow specialist	Continuous life-long learning, generalist with multiple specialities.
Compensation Criteria	Time, effort, rank	Skill, results
Cultural Orientation	Monocultural, monolingual	Multicultural, multilingual
Primary Source of Influence	Formal authority	Knowledge (technical and interpersonal)
View of people	Potential problem	Primary resource
Primary Communication Pattern	Vertical	Multidirectional
Decision-making Style	Limited input for individual decision	Broad-based input for joint decisions
Ethical Considerations	Afterthought	Forethought
Nature of Interpersonal Relationships	Competitive (win-lose)	Cooperative (win-win)
Handling of Power and Key Information	Hoard	Share
Approach to Change	Resist	Facilitate

1.14 SIGNIFICANCE OF MANAGEMENT PRINCIPLES

Organisations differ in the quality of the systems they develop and maintain and in the results they achieve. Different models of organisational behaviour substantially cause varying results. These models constitute the belief system that dominates management's thought and affects management's actions in each organisation. Therefore, it is highly important that managers recognize the nature, significance, and effectiveness of their own models, as well as the models of others around them.

Douglas McGregor was one of the first writers to call attention to managerial models. In 1957, he presented a convincing argument that most management actions flow

directly from whatever theory of human behaviour the managers hold. He suggested that management philosophy controls practice. Management's human resource policies, decision-making styles, operating practices, and even organisational designs flow from key assumptions about human behaviour. The assumptions may be implicit rather than explicit, but they can be inferred from observing the kinds of actions that managers take.

Theory X is a traditional set of assumptions about people. It assumes that most people dislike work and will try to avoid it if they can. Workers are seen as being inclined to restrict work output, having little ambition, and avoiding responsibility if at all possible. They are believed to be relatively self-centered, indifferent to organisational needs, and resistant to change. Common rewards cannot overcome this natural dislike for work, so management is almost forced (under Theory X assumptions and subsequent logic) to coerce, control, and threaten employees to obtain satisfactory performance. Though managers may deny that they hold this view of people, many of their historical actions suggest that Theory X has been a typical management view of employees.

Theory Y implies a more humanistic and supportive approach to managing people. It assumes that people are not inherently lazy. Any appearance they have of being that way is the result of their experiences with organisations, and if management will provide the proper environment to release their potential, work will become as natural to them as recreational play or rest and relaxation. Under Theory Y assumptions, management believes that employees will exercise self-direction and self-control in the service of objectives to which they are committed. Management's role is to provide an environment in which the potential of people can be released at work.

McGregor's argument was that management had been ignoring the facts about people. It had been following an outmoded set of assumptions about people because it adhered to Theory X when the facts are that the Theory Y set of assumptions is more truly representative of most people. There will always be important differences among people, so a few individuals will fit the assumptions of the Theory X model. Nearly all employees, however, have some potential for growth in their capabilities and demonstrated performance. Therefore, McGregor argued, management needed to change to a whole new set of assumptions about people—one based on emerging behavioural science research. These new assumptions had a powerful impact on subsequent managerial actions.

When seen through the lenses of history, McGregor deserves credit for a number of contributions. First, he stimulated subsequent generations of managers to think consciously about their belief systems and management models. Second, he was an early advocate of the practical value of reading and using research findings to better understand human behaviour. Third, he introduced and publicized one of the early theories of motivation—the hierarchy of needs model by A.H. Maslow. Finally, he became a spokesman for a trend that had been developing over a long period of time—the need to bring human values into balance with other values at work.

Models such as Theory X and Theory Y are also called paradigms, or frameworks of possible explanations about how things work. Any model that a manager holds usually begins with certain assumptions about people and leads to certain interpretations, implications, and even predictions of events. Underlying paradigms, whether consciously or unconsciously developed, become powerful guides to managerial behaviour. Managers tend to act as they think, because they are guided by their dominant thoughts.

Examples of paradigms and paradigm shifts abound. Japanese industry focused on low price for its products in the 1950s and 1960s; now the Japanese are world leaders because of their emphasis on quality. Some organisations projected a take it or leave it approach when demand for their goods and services was high (and competition low); now they try to become responsive to their customers' wishes and needs. Money was presumed to be the universal motivator in the early part of the twentieth century; now managers widely recognize that employees have other, widely varying needs (such as social, esteem, and self-actualization needs).

Top management's models are particularly important to identify, for the underlying model that exists within a firm's chief executive officer tends to extend throughout that

firm. For this reason, models of organisational behaviour are highly significant. Examples abound of the impact throughout the firm of a single executive, such as CEOs Roger Enrico at Pepsi Co and Eckhard Pfeigger at Compaq Computer.

We highlight in this unit the following four principles (paradigms): autocratic, custodial, supportive, and collegial. (Earlier models, such as those of feudalism and slavery, are bypassed.) In the order mentioned, they represent an approximate historical evolution in management practice during the last 100 years or more. Although one model tends to dominate at a particular time in history, at the same time, each of the other models is practiced by some organisations.

Just as organisations differ among themselves, so practices may vary within the departments or branches of one organisation. The production department may work within a custodial model while the supportive model is being tried in the research department. And, of course, the practices of individual managers may differ from their organisation's prevailing model because of those managers' personal preferences or different conditions in their department. Thus no one model of organisational behaviour is sufficient to describe all that happens in an organisation, but identifying a model can help distinguish one way of organisational life from another.

The selection of a model by a manager is determined by a number of factors. As we discussed earlier, the prevailing philosophy, vision, mission, and goals of managers affect (and are affected by) their organisational behaviour model. In addition, environmental conditions help determine which model will be most effective. The current turbulent conditions in some industries, for example, may drive firms toward the more collegial models, since rapid decision making and flexibility are needed. This suggests that the model should not be static and unchanging, but adapted across time. Our discussion of four models, beginning with the autocratic, roughly follows their historical evolution.

1.14.1 The Autocratic Model

The autocratic model has its roots in history, and certainly, it became the prevailing model of the industrial revolution. In an autocratic environment the managerial orientation is formal, official authority. Right of command delegates this authority over the people to whom it applies. Management believes that it knows what is best and that the employee's obligation is to follow orders. It assumes that employees have to be directed, persuaded, and pushed into performance, and such prompting is management's task. Management does the thinking; the employees obey the orders. This conventional view of management leads to tight control of employees at work. When combined with the often brutal and backbreaking physical tasks of that era and the intolerable conditions of disease, filth, danger, and scarcity of resources, the autocratic model was intensely disliked by many employees (and still is).

Under autocratic conditions the employee orientation is obedience to a boss, not respect for a manager. The psychological result for employees is dependence on their boss, whose power to hire, fire and 'perspire' them is almost absolute. The boss pays minimum wages because employees give minimum performance. They are willing to give minimum performance though sometimes reluctantly because they must satisfy subsistence needs for themselves and their families. Some employees give higher performance because of internal achievement drives, because they personally like their boss, because the boss is a natural-born leader, or because of some other factor; but most of them give only minimum performance.

The autocratic model is a useful way to accomplish work. It is not complete failure. The picture of the autocratic model just presented is an extreme one; actually, the model exists in all shades of gray, from rather dark to rather light. This view of work built great railroad systems, operated giant steel mills, and produced the dynamic industrial civilization that developed in the United States. It does get results, but unusually only moderate results. Its principal weakness is its high human costs.

The autocratic model was an acceptable approach to guide managerial behaviour when there were no well-known alternatives, and it still can be useful under some conditions (such as organisational crises).

However, the combination of emerging knowledge about the needs of employees and changing societal values suggested that there were better ways to manage organisational systems. A second step in the ladder of progress was needed, and it was soon forthcoming.

1.14.2 The Custodial Model

As managers began to study their employees, they soon recognised that although autocratically managed employees did not talk back to their boss, they certainly thought back. There were many things they wanted to say, and sometimes they did say them when they quit or lost their tempers. Employees were filled with insecurity, frustrations, and aggressions toward their boss. Since they could not vent these feelings directly, sometimes they went home and vented them on their families and neighbours; so the entire community might suffer from this relationship.

An example of the effects of management-induced frustration on the behaviour of employees occurred in a wood-processing plant. Managers treated workers crudely, sometimes even to the point of physical abuse. Since employees could not strike back directly for fear of losing their jobs, they found another way to do it. They symbolically fed their supervisor to a log-shredding machine! They did this by purposely destroying good sheets of veneer, which made the supervisor look bad when monthly efficiency reports were prepared.

It seemed rather obvious to progressive employers that there ought to be some way to develop better employee satisfaction and security. If the insecurities, frustrations, and aggressions of employees could be dispelled, the employees might feel more like working. In any case, they would have a better quality of work life.

To satisfy the security needs of employees, a number of companies began welfare programmes in the 1890s and 1900s. In their worst form these welfare programmes later became known as paternalism. In the 1930s welfare programmes evolved into a variety of fringe benefits to provide employee security. Employer, unions and government began caring for the security needs of workers. They were applying a custodial model of organisational behaviour.

Employee security remains a high priority for millions of workers in today's uncertain job market where lifetime employment is seldom promised to any employee. Many firms have historically gone out of their way to stabilize their workforce and preserve employee jobs. To avoid layoffs, they constantly retrain employees, reduce overtime, freeze hiring, encourage both job transfers and relocations, provide early retirement incentives, and reduce subcontracting to adjust to slowdowns in the computer industry.

A successful custodial approach depends on economic resources. The resulting managerial orientation is toward money to pay wages and benefits. Since employee's physical needs are already reasonably met, the employer looks to security needs as a motivating force. If an organisation does not have the wealth to provide pensions and pay other benefits, it cannot follow a custodial approach.

The custodial approach leads to employee dependence on the organisation. Rather than being dependent on their boss for their weekly bread, employees now depend on organisations for their security and welfare. Perhaps more accurately stated, an organisational dependence is added to a reduced personal dependence on the boss. If employees have ten years of seniority under the union contract and a good pension programme, they cannot afford to quit even if the grass looks greener somewhere else.

There are many programmes consistent with a custodial environment at the workplace. The Calvert Group, a Maryland-based mutual funds company, provides support of physical fitness, massage therapy, wellness seminars, parental leave, dependent-care time, and child-care programmes. Calvert reported that the turnover rate has fallen sharply from its preprogramme level of 30 per cent annually, the number of sick days taken is down, health care expenses are lower, and recruitment and training costs have been reduced. Apparently, employees become dependent on these custodial practices and then reluctant to change employers.

Employees working in a custodial environment become psychologically preoccupied with their economic rewards and benefits. As a result of their treatment, they are well

maintained and contented. However, contentment does not necessarily produce strong motivation; it may produce only passive cooperation. The result tends to be that employees do not perform much more effectively than under the old autocratic approach.

The custodial model is described in its extreme in order to show its emphasis on material rewards, security, and organisational dependence. In actual practice, this model also has various shades of gray, from dark to light. Its great benefit is that it brings security and satisfaction to workers, but it does have substantial flaws. The most evident flaw is that most employees are not producing anywhere near their capacities, nor they are capable. Though employees are happy, most of them really do not feel fulfilled or motivated. In confirmation of this condition, a series of studies at the University of Michigan in the 1940s and 1950s reported the happy employee is not necessarily the most productive employee. Consequently, managers and academic leaders started to ask again, is there a better way?

The search for a better way is not a condemnation of the custodial model as a whole but rather a condemnation of the assumption that this is the final answer, best way to motivate employees. The error in reasoning occurs when people perceive the custodial model as so desirable that there is no need to build on it toward something better. Although the custodial model is desirable to provide employee security, it is best viewed as the foundation for growth to the next step.

1.14.3 The Supportive Model

The supportive model of organisational behaviour had its origin in the "principle of supportive relationships" as stated by Rensis Likert, who said:

The leadership and other processes of the organisation must be such as to ensure a maximum probability that in all interactions and all relationships with the organisation each member will, in the light of his (or her) background, values, and expectations, view the experience as supportive and one which builds and maintains his (or her) sense of personal worth and importance.

Likert's principle is similar to the human resources approach.

One key spark for the supportive approach was a series of research studies at the Hawthorne Plant of Western Electric in the 1920s and 1930s. Led by Elton Mayo and F.J. Roethlisberger, the researchers gave academic stature to the study of human behaviour at work by applying keen insight, straight thinking, and sociological backgrounds to industrial experiments. They concluded that an organisation is a social system and the worker is indeed the most important element in it. Their experiments concluded that the worker is not a simple tool but a complex personality that often is difficult to understand. The studies also suggested that an understanding of group dynamics, coupled with the application of supportive supervision, was important.

The Mayo-Roethlisberger research has been strongly criticized as being inadequately controlled and over interpreted, but its basic ideas, such as a social system within the work environment, have stood the test of time. The important point is that it was substantial research about human behaviour at work, and its influence was widespread and enduring. The studies have truly been a landmark in the historical evolution of organisational behaviour, and awakened further interest in the supportive model.

The supportive model depends on leadership instead of power or money. Through leadership, management provides a climate to help employees grow and accomplish in the interests of the organisation the things of which they are capable. The leader assumes that workers are not by nature passive and resistant to organisational needs, but they are made so by an inadequately supportive climate at work. They will take responsibility, develop a drive to contribute, and improve them if management will give them a chance. Management's orientation, therefore, is to support the employee's job performance, rather than to simply support employee benefit payments as in the custodial approach.

Since management supports employees in their work, the psychological result is a feeling of participation and task involvement in the organisation. Employees may say we instead of they when referring to their organisation. They are more strongly

motivated than by earlier models because their status and recognition needs are better met. Thus they have awakened drive for work.

Supportive behaviour is not the kind of behaviour that requires money, rather, it is a part of management's lifestyle at work, reflected in the way that it deals with other people. The manager's role is one of helping employees solve their problems and accomplish their work.

The supportive model works well with both employees and managers, and it has been widely accepted at least philosophically by many managers in the United States. Of course, their agreement with supportive ideas does not necessarily mean that all of them practice those approaches regularly or effectively. The step from theory to practice is a difficult one. Nevertheless, there are more and more reports of companies that reap the benefits of a supportive approach, as this example illustrates:

When computer sales slowed at Hewlett-Packard, CEO John Young ordered all workers in the affected divisions to take two days off without pay each month. (This action was taken to avoid layoffs.) Many employees continued to work on the payless days anyway. In an even more dramatic move, managers in a profitable division voluntarily took 10 per cent pay cuts to show their solidarity with other Hewlett-Packard employees. This example suggests that a supportive approach, if practiced consistently in profitable times, represents an investment that can pay high dividends when the firm needs them.

The supportive model of organisational behaviour tends to be especially effective in affluent nations because it responds to employee drives toward a wide array of emerging needs. It has less immediate application in the developing nations, because their employees' current needs and social conditions are often quite different. However, as those needs for material rewards and security become satisfied, and as employees become aware of managerial practices in other parts of the world, we may also expect employees in those countries to demand a more supportive approach. Consequently, their progression through the models is frequently a more rapid one.

1.14.4 The Collegial Model

A useful extension of the supportive model is the collegial model. The term collegial relates to a body of people having a common purpose. The collegial model, which embodies a team concept, first achieved widespread applications in research labouratories and similar work environments. More recently it has been applied in a wide range of other work situations as well.

The collegial model traditionally was used less on assembly lines, because the rigid work environment made it difficult to develop there. A contingency relationship exists in which the collegial model tends to be more useful with un programmed work, an intellectual environment, and considerable job freedom. In other environments management often believes that other models may be more successful.

The collegial model depends on management's building a feeling of partnership with employees. The result is that employees feel needed and useful. They feel that managers are contributing also, so it is easy to accept and respect their roles in the organisation. Managers are seen as joint contributors rather than as bosses.

The feeling of partnerships can be built in many ways. Some organisations have abolished the use of reserved parking spaces for executives, so every employee has an equal chance of finding a space close to the workplace. Some firms have tried to eliminate the use of terms like bosses and subordinates, feeling that those terms simply create perceptions of psychological distance between managers and non-managers. Other employers have removed time clocks, set up "fun committees," sponsored company canoe trips, or required managers to spend a week or two annually working in field or factory locations. All these approaches are designed to build a spirit of mutuality, in which every person makes contributions and appreciates those of others.

The managerial orientation is toward teamwork. Management is the coach that builds a better team. The employee response to this situation is responsibility. For example, employees produce quality work not because management tells them to do so or because the inspector will catch them if they do not, but because they feel inside

themselves an obligation to provide others with high quality. They also feel an obligation to uphold quality standards that will bring credit to their jobs and company.

The psychological result of the collegial approach for the employee is self-discipline. Feeling responsible, employees' discipline themselves for performance on the team in the same way that the members of a football team discipline themselves to training standards and the rules of the game. In this kind of environment employees normally feel some degree of fulfillment, worthwhile contribution, and self-actualization, even though the amount may be modest in some situations. This self-actualization will lead to moderate enthusiasm in performance.

The collegial model tends to produce improved results in situations where it is appropriate. One study covered scientists in three large research labouratories. Labouratories A and B were operated in a relatively traditional hierarchical manner. Labouratory C was operated in a more open, participative, collegial manner. There were four measures of performance: esteem of fellow scientists, contribution to knowledge, sense of personal achievement, and contribution to management objectives. All four were higher in labouratory C, and the first three were significantly higher.

1.15 RELEVANCE IN HEALTH CARE INSTITUTIONS

Health care institutions are unique in several ways. In the first case these are the only places where we come across wide skill differential among the people working there. On the one hand we see highly skilled physicians and paramedics, on the other hand very large number of people who are easily substitutable. Managing an organisation characterised by such a high level of differential knowledge throws up unique management problems. Second dimension is added because of their criticality. Their ability to make an impact on the well being of the community is undisputable. Third dimension, as an out growth of the previous one, is communities' dependence on the health care institutions. There are large numbers of people who maintain happy and comfortable life without possessing a care or a computer; in other words we are not totally dependent on these industries manufacturing these goods. Where as, from birth to death, which are normal events in ones life one cannot do away without health care institutions. The fourth and the most compelling reason is the need for better management of these institutions, so that they can be run profitably and add value to society. The last issue is the most important. Unless this aspect is not properly looked into, the way the entire manufacturing and financial sectors are being taken over by the multinationals; the same destiny is likely to happen with our heath care institutions.

All these call for proper organisation of these institutions. And one of the fundamental requirements of proper organisation is to develop methodically trained professionals who will be able to infuse meaning and purpose for the institutions, and also add value to the stakeholders. To achieve this the first requirement is to develop trained manpower who will be in charge of these institutions. Towards this end awareness about the scientific principles is the first step.

1.16 LET US SUM UP

This is one question, which is not easy to answer. One can ask the same question with regard to physics, whether it is an art or science. Physics no doubt is a science; in fact nobody can have any slightest doubt about it. Many of our every day usages are the contribution of science. Unless one has slightest idea about the principles of physics, the fans we use everyday can not be manufactured. In fact all the fans available in the market for sale have been manufactured on the sound principles of physics. Technical specifications and cost remaining the same, we are likely to purchase that fan which looks attractive to us. This making thing attractive is an art, where science has no role. That fan manufacturer is likely to make good business that has been able to master the science of fan manufacturing and the art of making it attractive.

Similar is the case with management. Management principles and theories are mainly the produet of rigorous scientific methodology. Without a proper scientific framework

and approach no management principles can be comprehended. However, when it comes to application we all know that the same principles have to be conditioned going by the prevalent socio-cultural reality. That may be the key for a successful business manager, since he knows theory coupled with knowledge of the ground realities. That makes it possible to apply a management theory in a situation correctly. At this stage the theory steps out of the threshold of science and becomes an art. Therefore, it can be said that science of a theory becomes art when it is correctly applied. Can we say now that management can be both a science and art depending upon from which perspective we are looking at it.

UNIT 2 FUNCTIONS OF MANAGEMENT

Structure

2.0 OBJECTIVES

After going through this unit, you should be able to:

- explain the basic roles and functions of management;
- identify the objectives of managerial functions and their pre-requisites; and
- to develop an understanding about the necessity of the managerial processes.

2.1 INTRODUCTION

An organisation is formed for the fulfilment of certain objectives like earning a desired rate of profit on investment, exploitation of certain natural resources, development of a given geographical area, and supplying to the public some essential goods or services. Machines, materials, money and all other non-human resources are the tools and aids that man uses to achieve his tasks. Thus, a proper selection of men, their tactful handling and proper management is the essense of good overall management of an organisation.

2.2 FUNCTIONS/OBJECTIVES OF MANAGEMENT

Let us try and assess as to what management does. For example, let us determine the work involved in the construction of a mini steel plant. Broadly, these are:

- preparation of a feasibility report;
- working out a detailed project report;
- projection of time schedule or PERT network for completion of the project;
- arrangement and allocation of funds;
- selection of personnel and procurement of equipment;
- erection;
- commissioning; and
- despatch, marketing, finance and other commercial aspects.

If we break these broad items into finer elements and analyse the nature of work

involved in each of them, the process will reveal five basic elements which go into management. These are:

- Planning the course of action to be adopted to attain pre-determined objectives;
- Setting up an organisational structure and assigning specific responsibilities to different individuals;
- Directing and coordinating the efforts of all members working for the organisation;
- Controlling the activities of the members through setting up standards for their performance;
- Motivating the members to cooperate with one another for the achievement of the objectives.

In other words we can say that the functions and the objectives of Management may be the following:

1) To achieve an effective utilisation of human resources for the achievement of organisation goals.

2) To establish and maintain an adequate organisational structure and a desirable working relationship among all the members of an organisation by dividing the organisational tasks into functions, positions, jobs and by defining the responsibility, accountability, authority for each job and its relation with other job/ personnel in the organisation.

3) To secure the integration of the individuals and groups with the organisation by reconciling individual/group goals with those of an organisation in such a manner that the employees feel a sense of involvement, commitment and loyalty towards it. The absence of this integration will allow development of frictions, personal jealousies and rivalries, prejudices, personnel conflicts, cliques, factions, favouritism and nepotism. These will produce inefficiency and result in failure of the organisation.

4) To generate maximum development of individuals/groups within an organisation by providing opportunities for advancement to employees through training and job education or by offering transfers or by providing retraining facilities.

5) To recognise and satisfy individual needs and group goals by offering an adequate and equitable remuneration, economic and social security in the form of monetary compensation, and protection against such hazards of life as illness, old age, disability, death, unemployment etc. With adequate compensation and security, employees work willingly and cooperate to achieve an organisation's goals.

6) To maintain high morale and better human relations inside an organisation by sustaining and improving the conditions so that employees may stick to their job for a longer period.

Activity 1

Think of the extent to which, according to your estimate, these objectives are being fulfilled by the personnel office in your organisation and write below the extent of such fulfilment, choosing on the following for each objective:

i) Adequately, ii) To some extent, iii) Not at all.

Objectives	**Extent**
1	.....
2	.....
3	.....
4	.....
5	.....
6	.....

Write below against each objective what more you would like to have done in your organisation:

	Objectives	Suggestions
1	.....	.....
2	.....	.....
3	.....	.....
4	.....	.....
5	.....	.....
6	.....	.....

2.3 RESPONSIBILITIES OF MANAGEMENT

Considering organisational objectives, you will agree that the objectives are in the best interests of all the stake holders i.e. owners of enterprise, the community, the consumers of its goods and services, and members of the organisation itself, including groups who may belong to unions.

For enabling the organisation to fulfil these objectives the top management has to create some conditions as the pre-requisites. These are described below:

1) Existence of capable people in the organisation picked up on the basis of their merits and not on other considerations. If people are selected on other considerations they will be misfits, creating all sorts of problems for the organisation and other employees.

2) Plans for effective utilisation of efforts and potentialities of individuals and groups for appreciation of work well done and for future advancement and training. If people are left on their own, nothing will be achieved. They have to be provided with necessary opportunities and means, and given encouragement.

3) Considering employees as co-workers rather than as subordinates. If this is not done employees will not consider it their responsibility or duty to fulfil the objectives of the organisation.

4) A proper division of tasks of an organisation in accordance with a sound plan into functions and positions, each indicating a clear-cut authority, responsibility and duties as also relationship of one position with another. In the absence of such a division, chaotic conditions will prevail and no work will be done properly or even done at all.

5) The presence of clearly defined and comprehensive objectives and proper communication to all concerned. If objectives are not clear and if people, who are expected to work for achieving these, do not know about these, they cannot be expected to achieve them.

6) The formulation of objectives in consultation with senior persons in the organisation and common understanding among managers at all levels of the objectives. If the senior staff or personnel have not participated in the formulation of objectives they may not feel any real responsibility for achieving these. If managers at any level do not understand the objectives, they will not know why they are doing a given work what is expected of them and as a result may now even do it properly.

Activity 2

a) On what basis are employees selected in your organisation and what weightage is given to each one of these bases?

	Basis	Weightage
1.	.....	.....
2.	.....	.....

Basis	Weightage
3.	.....
4.	.....
5.	.....

b) What is the prevailing attitude of superiors towards the employees in your organisation:

Empoyees work **for** them	Employees work **with** them
.....	.....
.....	.....
.....	.....
.....	.....
.....	.....
.....	.....
.....	.....

c) Assess the division of tasks in your organisation and write below if the authority, responsibility and duties of various functions and positions are clearly indicated:

For all ☐ For most of them ☐ For some of them ☐ For none ☐

d) Do you have a clear understanding of the objectives of your Organisation?

Yes ☐ No ☐

If yes, how are these communicated to you?

2.4 THE MANAGEMENT PROCESSES

Management has been defined in ways that appear different but that have a strong underlying similarity. Some regard it as getting things done through people. Others consider it the process of reaching organisation goals by working with and through people and other resources. We define management in HSOs (Health Services Officers) as : *the process, composed of the set of interrelated social and technical functions and activities, occurring within a formal organisational setting for the purpose of accomplishing predetermined objectives through utilization of human and other resources.* The four main elements are that management:

- is a process—a set of interactive and interrelated, on-going functions and activities;
- involves accomplishing organisational goals or objectives;

- involves achieving these objectives through people and utilization of other resources; and
- occurs in a formal organisational settting.

The set of primary social and technical functions characteristic of the management process are planning, decision-making, organising, staffing, directing, and controlling. These functions represent the logical grouping of generic management activities. Others inherent in the management process include integrating, coordinating, change, and in some cases, representation. All health services managers engage in these functions and activities to some degree regardless of hierarchical level. Intensity and focus vary depending on the individual's degree of authority and scope of responsibility and work activities. Interrelationships of primary social/technical management functions are presented in Fig. 2.1.

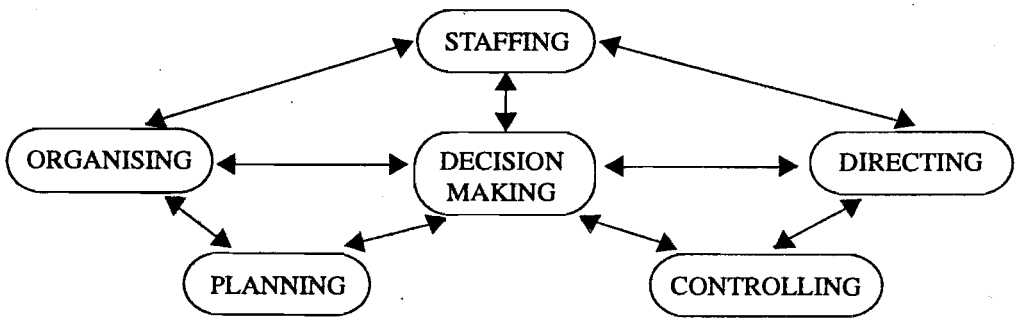

Fig. 2.1: Interrelationship of the management process functions.

Management Functions

The traditional classification system of management functions describes *how* managers do what they do—the activities they perform— to accomplish objectives (achieve work results) through people and utilization of other resources.

2.4.1 Planning

Planning is a technical managerial function that enables HSOs to deal with the present and anticipate the future. It involves deciding what to do, who, and how. It is also primary because the organising, staffing, directing, and controlling management functions are predicted on forecasts, objectives, strategies, and operational programmes developed through planning.

When planning, senior managers assess the organisation's external environment and how it will affect them, develop or redefine organisational and component objectives, determine specific means or strategies to accomplish objectives, and design operational plans and establish policy. When predetermined courses of actions are developed, necessary resources can be identified and acquired, and allocation can be made to give order and focus to organisation efforts. In short, the manager predetermines organisational arrangements for accomplishing objectives so that random haphazard activities are minimized or do not occur.

Although senior health services managers are typically concerned with the planning function activities of external environment assessment and objective and strategy formation for the organisation, middle-level and first-line managers similarly establish objectives for their specific area of responsibility. These objectives must be consistent with and suppportive of those established for the organisation as a whole. However, the planning done by these managers is typically focused on programme design and operation and procedures for performing them in their specific area of responsibility.

Planning implies:

i) **Making choices:** There can be any number of diversification opportunities to choose from. It is up to the management to choose the alternative which offers maximum potential for growth and profitability.

ii) **Committing resources:** The marketing manager who increases the amount earmarked for television promotion, and adds four more salesmen in each territory

with the objective of achieving higher sales, is committing scarce resources (money, people, etc.) which then are not available for any other use.

iii) **A time horizon:** Planning always refers to a specific time limit within which it must be completed. The field supervisor plans movements of each of his salesmen on a daily basis. The marketing manager plans promotion effort for the next three months, six months or twelve months. The top management may have a time perspective which may extend anywhere between 5 and 15 years.

Irrespective of the activity or level at which plans may be drawn, the critical factor is that they *focus on objectives* and are directed towards their achievement. They serve to channelise the energies of the company in the desired direction. The future is always uncertain and, therefore, risky. Stepping out of home on a cloudy day with an umbrella in hand is the way I cover my risk (of getting wet) against the anticipated but uncertain future rain. It may or may not rain but I am prepared. The umbrella is representive of the plan which a company draw up in *anticipation and preparation of the future opportunities and problems*. Planning implies not simply reacting to events but anticipating and preparing for them.

Planning ensures the most efficient use of scarce resources. Planning implies coordinated, inter-related effort towards achievement of the common objective rather than uncoordinated haphazard, arbitrary, overlapping action towards individual objectives. Joint, coordinated effort implies pooling of resources and their optimum allocation without any wastage.

Planning is the only way by which an organisation can *exercise control* to check that it is on the desired course of action. Only when there are objectives to work for, and plans to achieve these objectives, can the manager exercise his control to measure the performance of his organisation, department or subordinates. An organisation without plans and controls is like a raft marooned on high seas with no maps and compass to show the direction and no steering to manoeuvre with. Planning is needed at every level of management and in every activity and department of the company. Annual sales targets, cash-flow statements, budgets of each branch, individual career development blueprint, assembly line operations, scheduling of production over a number of machines in the factory are examples of plans.

To ensure that a plan is effective and succeeds in achieving its objectives, it must have the following components:

- Planning must start from the top. Objectives for the entire company are defined by the top management and then they percolate down throughout the organisation. Thus, logically, planning too must start at the top. For instance, one of the objectives of the top management of Beautiful Books Ltd. (a company specialising in publishing books on Indian culture and history) is to increase its turnover from Rs.1.15 crore to Rs.5 crore in 1987-88. The marketing director accordingly draws up a plan for increasing sale in existing markets and the new markets to be penetrated. From this overall plan, each area marketing manager will make his own annual, quarterly and monthly plans. And in turn each year sales supervisor will draw the plan for his entire sales team.

- Planning must be flexible. Planning is needed to anticipate and prepare for the unknown events of the future. To the extent that the future is uncertain and events may or may not occur, planning must be flexible. Flexibility implies ability to keep moving towards objectives despite unexpected occurrences. Flexibility is especially needed when there is high degree of uncertainty and risk, the lead time involved in implementing the plan is long, and cost of making mistakes is high. The R & D cell of a television manufacturing company designed a completely indigenous circuit for black and white television after 18 months of experimentation and used 100% more funds than were allocated to it. The success of the circuit is critical to the company as its entire marketing strategy for the coming 2-3 years is based on this. If the circuit is successful, the company will be able to establish its strong position in the market. However, if the circuit shows signs of failure the company is ready with its plans to airlift the circuits at a day's notice from its Japanese collaborator. Thus one way to allow for flexibility is by developing alternate or contingency plans.

- In the short-run, careful detailed planning without allowing for much flexibility will improve operational efficiency. But undue emphasis on inflexibility or rigidity may do more harm than good. Every manager has to find his own level of balance in allowing for flexibility.

  Short-term planning must be integrated with lone range planning. The long range plans, must be broken down into short-term plans on the basis of which the managers can take action. There can always be a difference of opinion on what constitutes the long and short-term. Some define five years as the long-term and anything up to one year as the short-term. In reality the definition will always vary according to the nature and scope of organisational activity for which planning is being undertaken. However, you may define the long and short-term, the point to remember is that the short-term plans must be derived from, and contribute to the long-term plans.

- Plans are good only if they are properly implemented by the people down the line. An effective wasy to ensure this is to involve the people responsible for implementation in the entire process of planning.

  However, despite all the above precautions, plans sometimes fail because of environmental and internal limitations. Government policies, regulations, laws, statutory obligations, and rapid social and technological changes pose external limitations on the company's planning effort. Within the company, cumbersome procedures, capital inflexibilities in terms of investments already made, inadequate or inaccurate information are the possible barriers which a company may face.

Activity 3

List the various activities for which your organisation undertakes the formal planning process. Evaluate these plans on the basis of what you have learnt about planning.

.....

.....

.....

.....

.....

If objectives of a Health Programme in a State, District or Primary Health Centre are to be achieved, certain basic management functions are to be carried out. These functions are basically (a) Planning, (b) Implementing and (c) Control. This is a modern approach to management functions.

The job functions of different cadre of health personnel in the district and peripheral Health Services structure and the managerial functions performed by them involves (or should involve) the following steps in order to initiate and carry out the managerial process successfully:

- Assessment of health situation as health status of people, health facilities, assessment of the resources, training facilities, health organisation;
- Projections of health situation over the plan period;
- Definition of nature of health problems and selection of priorities;
- Definition of goals and objectives of health sector plan as well as goals and objectives for each of the programmes for tackling particular health programmes;
- Programme planning and implementation i.e., formulation of plan for each health programme according to priorities and putting them into action;
- Monitoring of the programme, i.e., keeping track of the programme activites to see that they are going according to the plan; and
- Evaluation, meaning measurement of the outcome of a programme or activity against predetermined objectives.

The above seven steps contributing to the managerial process for delivery of PH Care could be viewed from three angles, namely:

- Programme Planning
- Programme Implementing and
- Controlling (Monitoring and Evaluation)

These programme components are performed in varied degrees at various levels by different cadre of health functionaries rendering primary health care services. The District Medical and Health Officer, a PHC Medical Officer or a Programme Officer, each one in rendering their assigned professional services also carry out, certain managerial functions which contribute to the total managerial process at the district level.

The Planning Process in Health

The essentials of planning in health lie in answering the following key questions:

1)	Where are we now?	(Situational Analysis)
2)	Where do we want to reach?	(Goals, Objectives, Priorities, targets and strategic decisions)
3)	How well we get there?	(Organisational constraint, resources and organisational structure, functions and management)
4)	How well we have done?	(Monitoring, evaluation and feedback)
5)	What new problems do we have?	(Replanning)

The steps for planning in health, like the planning process include the following:

1) Health situation analysis of the area to assess health problems. Health resources and opportunities for action by collecting data through available sources and conducting baseline surveys.
2) Establish health priorities of the area.
3) Identify key areas for action within national health plan objectives and programme objectives.
4) Setting targets for action.
5) Identify tasks to be performed.
6) Matching organisational inputs and resources with key tasks.
7) Draw implementation plan on programme objectives, inputs, time frame and outputs.
8) Develop a monitoring plan and built in feedback mechanisms. Detrmine indicators of monitoring and supervisory plan.
9) Evaluation
10) Replanning

Inadequacies in planning will directly contribute to inadequacies in monitoring. Hence:

1) The plans should identify key result areas and define how they will be measured.
2) The plans should prioritize activities so that they receive adequate emphasis during monitoring.
3) The plans should cater to local variations, otherwise monitoring would identify programme performance variations resulting from the local variations which do not require any action.

The monitoring process thus comprises of:

—Detecting deviations from plans

—Diagnosing causes for deviations

—Taking corrective action

1) Use of staff participation in the planning process to obtain their commitment for implementation;
2) Use of experts for advice;
3) Training to reinforce skills and commitment;
4) Use of personal, direct communication;
5) Strengthening of supervisory systems; and
6) Giving and receiving feedback of relevant information

2.4.2 Decision-making

Decision-making is a pervasive technical management function that is inherent in all others. Managers must be decision-makers. Health services managers make decision when they monitor and control work activities, and when they plan, establish, or change organisational arrangements and work design and content, acquire and assign personnel to particular jobs or tasks, and direct efforts of others.

Decision-making involves making choices from alternatives. It is a function performed by all managers. However, the scope and nature of decision-making techniques used, and importance of those decisions concerning structure-tasks-people relationships and their integration vary depending on the manager's position in the organisation, degree of authority, and scope of responsibility. Managerial decision-making also involves allocation and utilization of resources. Senior managers make policy decisions affecting the entire organisation and allocation of resources among departments, whereas first-line managers make decisions about the allocation and utilization of resources provided them by senior management.

Making a choice is making the decision. Follow up of the decision to ensure that it is properly carried out is very important. A decision which does not get implemented remains a decision only on paper and not in reality. The final step is to gather feedback on the impact generated by the decision.

Decision-making is so important because it implies commitment of resources, the desired outcome of which is never certain. Decisions are made under conditions of uncertainty and risk. Decisions made today have implications reaching into the future. The risk arises out of the fact that the manager never has complete facts and knowledge about the implications of his decision and there is always the chance that the wrong decision may be taken.

Many mathematical tools and theories have been developed to improve the quality of decisions which managers have to make under risky and uncertain conditions. Linear programming, queuing theory, probability and game theory, risk analysis, and decision trees are some of these tools. These will be discussed at length at a later stage.

Activity 4

Think of any decision which you may have made in the recent past. Write down the various alternatives which you considered, and the manner in which you evaluated them to arrive at the best choice.

.....

.....

2.4.3 Organising

The management function of organising is technical in nature. It concerns the following: establishment of authority and responsibility relationships and formal structuring and reporting relationships; division of work, job design, and methods; work process flow; and coordination, information, and feedback systems within HSOs. It establishes the formal setting in which individual and group activity is carried out to accomplish work. Elements of concern are structure-technology-people relationships with an awareness of how each affects the other. Senior managers are typically concerned with broad aspects of organising, such as authority and responsibility relationships, departmentation of the organisation, and coordination of its components, whereas middle-level and first-line managers are concerned with specific tasks related to job design, work process flow, and work methods and procedures.

Organising refers to the formal *grouping* of people and activities to facilitate achievement of the firm's objectives. Issues for discussion here are the types of organisation structure, degree of centralisation, levels of management, span of control, delegation of authority, unity of command, line and staff relationship, and staffing.

Structure refers to the specific manner in which people are grouped. An organisation can group its people on the basis of the various functions (such as production, personnel, finance, marketing), geographical territories or around specific products or product lines (such as detergents, toiletries, basic chemicals, agro-products, as in case of Hindustan Lever Limited). The concept of matrix organisation is a recent evolution and combines the functional and product organisation. This type of organisation is especially useful in case of projects which require both specialists as well as functional experts to execute a project within a specified time frame. Another type of organisation is by the type of customers served. A company manufacturing and marketing computers has organised its sales department in two groups. One group sells to institutions such as offices, banks, schools, colleges, etc., while the other group sells to individuals. Many companies selling office equipment have organised separate marketing teams to cater to the private sector and the public sector because of the different cultures prevailing in them.

Centralisation refers to the point or level where all decision-making authority is concentrated. One-man enterprises, such as a small bread and butter stores, vegetable vendor, a self-employed car mechanic, are examples of complete centralisation. As the enterprise grows, it becomes increasingly difficult for one person to manage alone and he has to necessarily line up other poeple and give them authority to make some decisions. These decisions may be routine, programmable decisions, but complete centralisation is no longer possible. The decision-making authority is now vested in more than one individual. This is decentralisation.

You require information to make a decision. It is possible that information may be generated at one place but the decision is taken at another. A Bombay based multinational involved in making and selling ball bearings has its manufacturing facility at Pune. Every evening all information regarding the day's production, machine down time, inventory position is sent to the head office via the linked computer facility and all decisions regarding change in production scheduling are made at the head office. The introduction of real time information with the help of computers enables information generated at one place to be instantaneously transmitted thousands of miles away for making a decision. However, the real criterion for an organisation having a centralised or decentralised structure is a reflection of the top management's thinking and philosophy.

Closely related to the concept of centralisation are the concepts of levels of

management and span of control. Levels of management refers to the number of hierarchical levels under the control of a particular manager. Machine operator, foreman, floor manager and production manager represent the levels of management in a typical production department under the director. The machine operators report to the foreman, the foreman reports to the floor manager who in turn reports to the production manager who is accountable to the director. The number of machine operators who directly report to the foreman represents his span of control. There is a great deal of controversy regarding the ideal number of people that a manager can effectively control or the ideal span of control. Many management thinkers are of the view that three to seven is the ideal range. In practice, this may actually vary from one individual manager to another.

At each level of management, there is a reporting relationship between the manager and the workers. The fewer the number of people that a worker has to report to, the less will be the problem of conflict in instructions, and greater the feeling of responsibility for results. Similarly, the clearer the line of authority from the manager to the workers, the better the decision-making and communication.

The staff functionary reports directly to the top management and is not a part of the chain of command.

The company may draw up any number of ambitious plans, but if it does not have the right kind of poeple, it can never succeed in implementing these plans. One of the biggest challenges which a manager faces is matching the right people with the right jobs. The process of staffing starts with defining the job to be done and the necessary qualifications, skills and experience required to do it. The next step is to search for the persons with the desired background. The search may involve a number of complex steps such as advertising the job-through newspapers and specialised magazines, screening the applications received in response to the advertisement, conducting a selection process which may include a variety of techniques such as written test, group discussion, personal interview, etc. Before making the final selection, it is important to be sure that the candidate fits in well with the other people and the culture of the organisation.

Having found the right candidate, it is equally important that you are able to retain him. Among other things, motivation and leadership provided by the top management of organisation also plays an important role.

Activity 5

What is the basis for organising the various departments in your company?

Can you identify the various levels of management and the span of control at each level as well as the reporting relationships?

2.4.4 Staffing

The management function of staffing encompasses activities concerned with acquiring and retaining human resources. It is both technical and social in nature. Technical aspects include manpower planning, job analysis, recruitment, testing, selection, performance appraisal, compensation and benefits administration, employee assistance, and safety and health. Social aspects include those activities that influence behaviour and performance of organisation members; training and development, promotions, counseling, and discipline. All managers engage to some degree in one or more staffing function activities; appraising subordinates, determining compensation changes and promotions, and disciplining. However, unlike other management functions, most staffing activities are centralized under one manager who has overall responsibility for human resource acquisition and retention for the entire organisation as well as for labour relations and collective bargaining.

2.4.5 Controlling

Planning and controlling go hand in hand. There can be no control without a plan and plans cannot be successfully implemented in the absence of controls. Controls provide a means of checking the progress of the plans and correcting any deviations that may occur along the way.

As each worker enters the factory premises in the morning, his time of arrival is electronically (or manually) punched on his card and every evening his departure time is similarly recorded. This simple control process is effective in checking the time spent by each worker in the factory and at the end of the month for calculating his wages and overtime. The mere act of recording makes each worker conscious of his late arrival and acts as a self-check on his timing. In contrast to this simple control, the annual budget for the subsidiary of a multi-location company requires a far more sophisticated process for controlling its many diverse activities.

The type of control required will vary according to the factors that are to be controlled, and the critical importance of the factors to the organisation's success. The more critical the factor the more complex is the control mechanisms needed to check its progress. Finance is a very critical area of management and most companies devise elaborate and sophisticated financial controls.

A control is meaningful only when there is clear cut responsibility for activities and results. It is meaningless to have a control process which simply points out deviations but cannot pinpoint the area in which they occurred and who is responsible for taking the corrective measures.

Control may be used to measure physical quantities (such as volume of output, number of man hours, number of units of raw material consumed per machine, etc.), monetary results (value of sale, capital expenditure, return on investment, earnings per share, etc.) or to evaluate intangibles such as employee loyalty, morale, and commitment to work. Obviously, the third kind of controls are the most difficult to design and implement. No quantitative measure can be used, but only a qualitative descriptive evaluation is possible.

There are three basic steps involved in designing a control process.

i) **Establishment of standards:** Controls are established on the basis of plans and so the first step is to have clear plans which in turn become the standards for controlling. The sales forecast plan which sets sales targets itself becomes the standard against which actual sale is measured. However, an effective control process focusses only on the critical variables rather than controlling all the variables. It also indicates the permissible range of deviation from the expected target. Only when the actual performance is outside this range, does it become a corrective action. Similarly, the marketing manager at the head office is interested in the sales figures achieved by each branch and not in the performance of individual salesman.

ii) **Measurement of performance:** Having set standards it is necessary to devise a system for measuring the performance of individuals, departments or the company against these standards. In some cases quantitative goals can be set, such as

number of units to be sold by each salesman, number of units to be produced per machine, or the profit to be generated by each branch office. However, evaluating performance in case of managers at the top level or those operating in areas such as personnel, public relations, and administration is far more difficult. The work output cannot be translated into quantifiable terms. Only a qualitative appraisal is possible.

iii) **Correcting deviations:** The ultimate objective of the control process is to pinpoint the occurrence outside the permissible range of action to allow management to take corrective action. The maximum number of rejects per machine per day is fixed. When the number of rejects increases beyong this acceptable level, it is time for the production supervisor to investigate and take suitable steps to correct the situation.

The successful control process hinges on the all important concept of feedback. This refers to the information on the critical control variable of the operation or activity which when fed back to the manager triggers off corrective action.

Except in a self-regulated, closed mechanical system where the corrective action is taken instantaneously and automatically, most activities within an organisation require human intervention. The finance manager must find out why profits have fallen below the established level and take suitable steps to remedy this. In some cases, only a minor corrective action is needed. But sometimes the situation requires drastic action, even scrapping a department or plant whose operation has become totally unprofitable.

Within the organisation, feedback usually implies a lag between the time when the event actually occurs and the time by which information about the event reaches the concerned manager. Sales figures for the preceding month may not be available to the manager before the 7th of the current month. The manager can only take note of what happened in the past and take measures to prevent its occurrence in the future. Too long a time lag prevents any meaningful control or corrective action. To overcome this problem of time lag, most companies generate daily reports of critical variables which provide early warning signals to the manager. But even daily reports may reach two days later when they have to travel a long distance from say Jaipur to Delhi. With the introduction of computers and real time information systems (instantaneous transmission of information) this problem can largely be overcome.

All control processes should reflect the plans that they are supposed to follow. However, to be truly effective the controls must highlight the critical variables in an objective manner, and be worth their cost in installing and operating.

Budget is a traditional and widely used control process. Apart from this a company may use historical statistical data, or break-even analysis to control its operations. By the use of mathematics, many sophisticated control techniques are also possible. These pertain to implementing control for inventory management, distribution logistics and project or programme management. Some of these such as Programme Evaluation and Review Technique (PERT), Critical Path Method (CPM) will be dealt with in detail in the subsequent units.

Activitiy 6

What are the various control processes used in your organisation, and specifically in your department? Assess the effectiveness of these controls from the viewpoint of their ability to measure performance and highlight critical deviations.

2.6 Motivating and Leading

Having established plans, controls, and an appropriate structure to achieve the organisational objectives, the manager now has to get his people to work. Motivation is that desire or feeling within an individual which prompts him to action. Every individual has needs, desires and drives, which we collectively call motives and which channelise all his or her behaviour and action towards achievement of some objectives. The manager's role is to influence each individual's behaviour and action towards achievement of common organisational objectives.

A great deal of research has been conducted in this area and there are many theories of motivation. It is not possible to explain all these theories here and we shall only briefly explain the various factors that can act as motivation.

Money is the most commonly used motivating factor in the form of salary, bonus, incentives, commissions and rewards. Salary or wage is of course the primary motivation, and the poorer the economic background of an individual the greater the motivational value of money. However, once a basic salary or wage is assured, to motivate people to work that little bit extra, achieve that ten percent higher sales figure, incentives and commissions come in handy. Most sales organisations pay salary plus incentives to their sales people. The incentives may be calculated on the basis of individual or team results, and may be linked to a sales target. Similar incentives can be offered to the production department. However, performance linked rewards are difficult to compute in areas such as finance, personnel, and administration where work output cannot be easily measured. A percentage of total profits can be distributed to these departments as incentive.

Man does not live by bread alone is an old saying. Man is a social animal and seeks recognition and status in society through his work. The status or position which an individual enjoys in the organisation, the number of people who work for him, the non-monetary benefits and perks which he enjoys are important motivational factors. In fact sometimes these are more important than the actual take-home pay packet.

Gupta started his career as a salesman in a medium sized company manufacturing and marketing stereo systems. Because of his analytical ability, capacity to work hard and achieve results, Gupta soon rose to be the area sales manager of North India. The owner of the company relied a great deal on Gupta's judgement and always consulted him on every important matter. Gupta was making good money, performing well and enjoyed the great confidence of the owner, yet he felt that there was no power or position in his job which could give him a better status in society. Therefore, when the opportunity arose, Gupta joined an American multinational as Divisional Manager, selling scientific laboratory glassware. It was the glamour, the power, and the status which the job conferred on him that motivated Gupta to join. However, two years with the multinational were enough for Gupta to realise that he had no authority to take any independent decisions and he was not deriving any satisfaction from his job. Gupta quit his job and went back to his previous employer. Thus satisfaction at work is an important motivating factor.

The lesson from Gupta's story is that the same individual will be motivated by different factors at different stages of his career. Generally as you move up the organisation to more important positions, the importance of money and monetary benefits as motivating factors decreases and intangible factors such as job satisfaction, confidence of the boss, good relationship with the boss, the status and respect commanded in the organisation, etc. become more important.

The physical working environment in which a person works also has tremendous motivational force. A pleasant, noise-free, well-lit room with comfortable temperature, and proper facitilies of telecommunication, secretarial assistance, canteen, transport, etc. is always conducive to work.

Different individuals are motivated by different factors. This is because each individual in the organisation comes from a different socio-econonic, cultural, religious, educational and family background, and each of these has a role in determining the degree to which he can be motivated by different factors.

In most Western countries, a great deal of emphasis is laid on leisure and individuals

may be motivated to take up that job which affords greater opportunity for leisure. Similary religious background and personal values are important influences on the effectiveness of motivating factors. No matter how attractive the salary, not many Hindus would like to work in a beef packing factory.

The manager's concern is to find a set of common factors which can motivate all his people coming from diverse and different backgrounds and working at different levels of management. The manager's task will be greatly simplified when he understands that motivational factors are present in, and can be used, in design of work, **rewards**, work **environment**, work **relationships** and work **content**. All monetary benefits and non-monetary advantages such as free medical cover, company car and driver, club membership, etc. are part of the work reward and are important motivators.

Work environment as a motivating factor, first and foremost, refers to the status of the organisation for which a person works and the mere fact of his working in that organisation gives him that status. Harvard University has the reputation of being amongst the best in the world and anyone who has graduated from Harvard is generally perceived to be at least above average, if not excellent. The actual physical factors present in the work environment also act as motivators.

Relationships developed at work, with the boss, colleagues and subordinates have an important motivating influence. The more congenial, friendly and supportive are these relationships, the greater their positive motivational value. In contrast, strained relationships which create tension and unhappiness are serious enough reasons for people to leave jobs which in all other respects seem very comfortable and attractive.

The design and content of the actual work to be done is in itself an important motivational factor. An element of freedom to experiment with new ideas within the parameters of the job fulfils the creative urge in every individual. Freedom to take decisions and assume responsibility for the results are factors which enhance an individual's self-confidence and feeling of self-esteem. The more such factors can be built into the job, the greater would be the job satisfaction of the individual performing the job. A happy, satisfied worker is a productive worker and a great asset to any organisation. If an individual is himself associated with designing the content and objectives of his job, there are greater chances that he will work his utmost to fulfil these objectives. This is the approach known as Management by Objectives (MBO) and has tremendous motivational potential.

The manager has not only to motivate his people but also provide them with leadership. To that extent every manager is a leader. A manager has to *inspire* and **influence** his people to willingly work towards achieving the organisational objectives.

Much research has been conducted in this field and different studies have emphasised different aspect in attempting to answer the question 'What makes an effective leader?' When put in a situation of leading, you must remember it is a role that you are performing, but that your personality has an important influence on your performance as does the situation in which you are expected to perform.

To be an effective leader, a manager must have a pleasing physical personality, ability to get along with people, qualities of honesty and integrity and be an excellent speaker. To command respect of others he must excel at his basic job whether it is operating a lather machine or managing the finances of a large company. The leader must first set an example by his own actions rather than by just making speeches. His actions must communicate to the people that he belongs to them. Only when he is able to generate this feeling of oneness will he be able to inspire confidence in his people.

Secondly, a manager must rememeber that he is only playing a role. However, to be able to perform effectively, the role demands that the manager be perfectly objective in all his judgements and decisions, and beguided only by the organisational objectives and have no other considerations. For a leader the interests of his people are of paramount importance and come first while personal benefits take second place.

Thirdly, the role must be moulded according to the unique situation in which the manager is placed. In our society, great emphasis is laid on personal relationships and contacts and managers are perceived to be father figures and are expected to have a paternalistic attitude towards their workers. In contrast, in the West, especially in

countries with a British colonial past, the relationships between manager and worker is only confined to the work. There, if a manager were to adopt a paternalistic approach, he would be totally ineffective. A manager who usually follows a consultative, participative approach, seeking the opinions and consensus of his subordinates before implementing any decision, in a crisis situation may adopt a very authoritarian approach and effectively manage the situation.

When Lee Iaccoca, took over the management of Chrysler Corporation, USA, it was an ailing automobile giant. To bring it out of the loss making situation, Iaccoca inspired tremendous confidence and loyalty in his workers by setting personal example of great hard work and accepting only a token wage. Under his leadership the company was soon able to turn its losses into profits.

Political leaders such as Gandhi who commanded the respect of millions of people are a model for managers to learn from. Gandhi's leadership style was so finely tuned to the moods of the people and the situation that his every word was law for the common man. His actions and life-style made the people feel he belonged to them.

Activity 7

How do you evaluate your boss as a leader on account of his personality, role play, and tuning to the requirements of the situation?

Briefly describe a situation in which you excelled as a leader. What do you think were the contributing factors to this performance?

.....

.....

.....

.....

.....

.....

Senior Management Activities

The senior management activities shown in Fig. 2.2 are clearly policy in nature. They are concerned with overall scope and broad direction for the organisation and they are not detailed and operational. For example, the senior manager sets policy regarding staffing by determining department personnel levels; lower level managers operationalize and implement. Similarly, the senior manager sets policy on new services, which is a planning function activity, while the lower level manager is involved in specifics of design and implementation.

***PLANNING* (INTERNAL MANAGEMENT)**

- Defining the general course and goal priorities for the organisation
- Determining matters for the governing board or owner(s) to consider
- Determining new diagnostic, treatment, and non-professional services to be added, and new construction

***PLANNING* (ENVIRONMENTAL SURVEILLANCE)**

- Determining and establishing priorities for new services
- Determining what other organisations in the service area are doing and what services they are offering
- Interpreting how legislative and regulation trends might affect the organisation
- Interpreting how health services delivery and financing trends might affect the organisation

***ORGANISING* (INTERNAL MANAGEMENT)**

- Determining how authority and responsibility are divided among individuals and departments

- Determining formal communication patterns (and reporting relationships) within the organisation

STAFFING (INTERNAL MANAGEMENT)

- Determining departmental staffing levels
- Determining salary scales and fringe benefits for management personnel
- Evaluation, training, and development of management personnel

CONTROLLING (INTERNAL MANAGEMENT)

- Developing and improving management information systems and procedures to be fed back to operations
- Containing costs of professional services to patients and improving efficiency and productivity in non-professional departments
- Developing and improving accounting and budgeting practices
- Improving the accessibility of the organisation's patient care services and monitoring patient opinions about the care received

EXTERNAL RELATIONS

- Informing the community-at-large about the organisation
- Dealing with community leaders on matters about the organisation
- Influencing legislation and regulations
- Dealing with government licensing agencies

Fig. 2.2: Senior management activities (Source: Adapted from Ingrid K. Kuhl, *The Executive Role in Health Services Delivery Organisations*, Washington, D.C., Office of Applied Research, Association of University Programmes in Health Administration, 1977).

2.5 LET US SUM UP

In this unit we have tried to understand the basic rules and functions of the management. In an organisation basically planning, organising, decision-making, coordinating, controlling and motivating functions, are key processes to successfully run the organisation. This unit also deals in detail with various managerial functions at various levels and objectives thereof, which must match with the broader objectives of the organisation. Setting up objectives, and translating them into action for the desired results is a tedious process involving various managerial skills and tactics. Towards the end, this unit has dwelled upon in greater details about management processes which are essential for survival in a structured organisation namely planning, decision-making, organsing, staffing, controlling and motvating, and leading. Having gone through this unit you should be able to understand your day to day working and make it planned and organised in a more systematic and scientific way. These processes do work well if the system is working well or even the vice-versa is also true i.e. if the processes work well they may lead to better placed systems in the organisation.

2.6 KEY WORDS

Break-even Analysis : Comparison between sales and expenses to determine that volume of production where there is no profit and no loss.

Budget : Statement of plans expressed in quantitative and financial terms for the allocation and use of resources.

Environment : The universe in which the firm operates is known as its environment and includes all those economic, political, socio-cultural, legal, demographic and other factors which have a critical bearing on its operations.

Organisation, Firm or Company : These terms have been used interchangeably and refer to all types of formal bodies created for a specific purpose. These include all types of business organisations and non-commercial organisations such as hospitals, schools, charitable trusts, voluntary bodies, etc.

Organisational Objective(s) : The specific purposes, results and achievements sought by the organisation. In this lesson we have used this term in a broad sense to include both mission and objectives.

UNIT 3 MANAGEMENT TECHNIQUES

Structure

3.0 OBJECTIVES

After going through this unit, you should be able to:

- understand the importance of management techniques;
- critically examine the role of management techniques in day to day management of the health-care system; and
- use various management techniques explained in this unit, to streamline the systems you are working in/operating.

3.1 INTRODUCTION

The main function of administrator is to take decision. Accurate data and information are the prerequisites for arriving at the correct decision. Decision making is a vital component of hospital management. There are various techniques, which are available to the manager and these can effectively be used in the field of Hospital Management. Hence, it is imperative that all health administrators have a conceptual knowledge of the following managerial techniques:

- The feedback loop
- Time series analysis
- Value analysis

- Break-even analysis
- Operations research
- PERT
- Strategic planning
- Forecasting
- Statistical quality control
- Management by Objectives
- Quality Circles
- Management problem solving methods
- Managerial skills
- Cost analysis
- Utilisation management

3.2 THE FEEDBACK LOOP

The hospital, in one way, can be described as a collection of functional service units. Each of the units perform some specialised function. The departmental organisational structure of units like Nursing, Dietary, Radiology, Laundry etc. are in fact designed on functional basis. In a typical hospital there may be more than twenty such functional units. The functions of the units vary widely and these may range from removal of waste and garbage to very specialised clinical functions. Nevertheless, from the point of view of the hospital manager each of these units can be functionally designed as a basic feedback loop to provide result expected information or goal achievement results (Fig. 3.1).

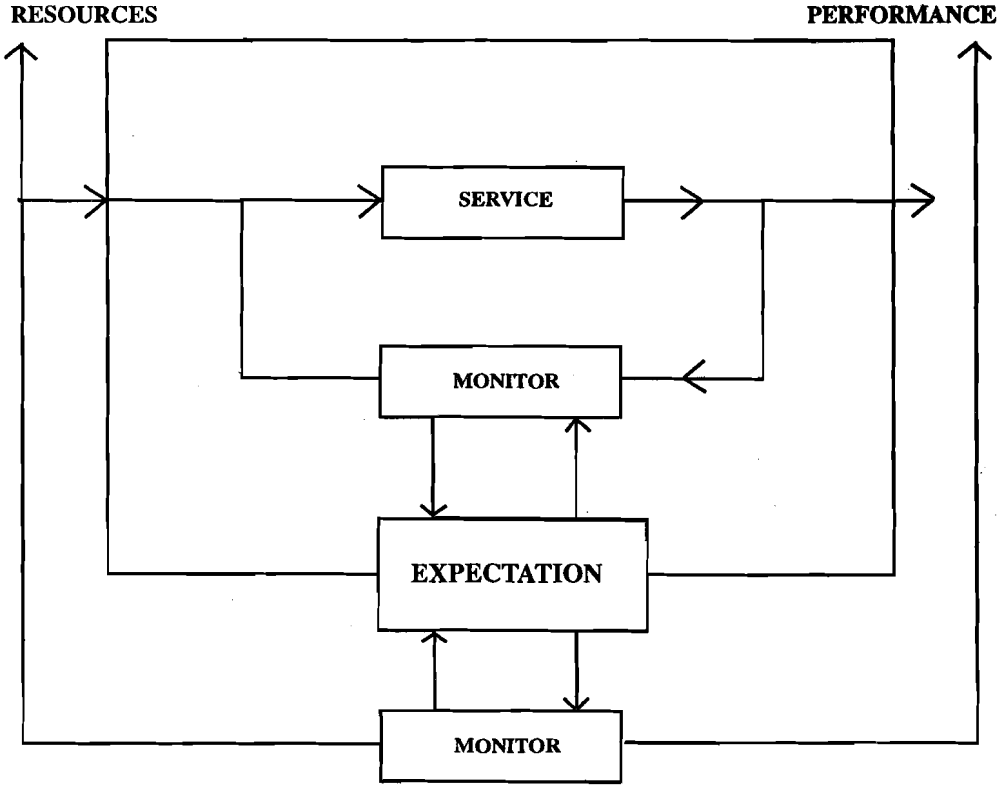

Fig. 3.1: Multiple feedback loop

No hospital function can be effectively performed in the absence of a demand for it. Demand in a hospital is generated by a process different from the functional services. The adjustment is required in various individual units, if the performance is expected at desirable level. Like a functional change of the Operation Theatre would need the back up of CSSD, Laundry, Blood Bank etc.

3.3 TIME SERIES ANALYSIS

Hospital is a place where most precesses are stochastic, i.e. subject to change variation when exact prediction is impossible. What must be substituted is probabilistic prediction, given an expected value and the probabilities of the chances of changes of given amounts around the expected value. The opposite of stochastic is deterministic, a process which always yields its expected value and is subject to no change fluctuation. The expected value is the mean or average of the distribution of possible values. A series of data for several historical periods in order is called a **Time Series.**

3.4 DECISION MAKING

Decision making is the essence of an administrator's job. While planning, organising, coordination/controlling, implementation and evaluation are the basic functions of management, each of these clearly involves deicisions. Decision making is the process of choosing between alternative courses of action. Making a decision involves four steps:

—Identifying the central problem

—Developing alternatives

—Analysing the alternatives, and

—Making the final decisions

Effective decision making requires several alternatives to choose from. Creativity and the effective use of groups are two important factors in developing alternatives.

Most widely used alternatives of analysis of techniques are:

- Capital budgeting
- Break-even analysis
- Operations Research
- PERT (Programme Evaluation Review Technique)

Capital budgeting is used to analyse alternative capital investments.

3.5 BREAK-EVEN ANALYSIS

Most fundamental quantitative technique available to administrators is BEA. This is a graphic representation between revenues and costs at various levels of output. The break-even point in the analysis is that point (level of output) at which total revenues will equal total costs, thus resulting in neither profit nor loss for the organisation. It indicates the quantity of output that must be achieved in order to cover total costs of oepration and also the point in output at which profits will begin to accrue.

$$\text{Break-even point} = \frac{\text{Fixed Costs}}{\text{Price per unit} - \text{variable cost per unit}}$$

This break-even analysis can be shown graphically also (Fig. 3.2).

3.6 OPERATIONS RESEARCH

Break-even analysis has been discussed in detail in Course II: Financial Management. Operations research is the application of scientific methods to management problems. It refers to a set of mathematical techniques through which a variety of organisational

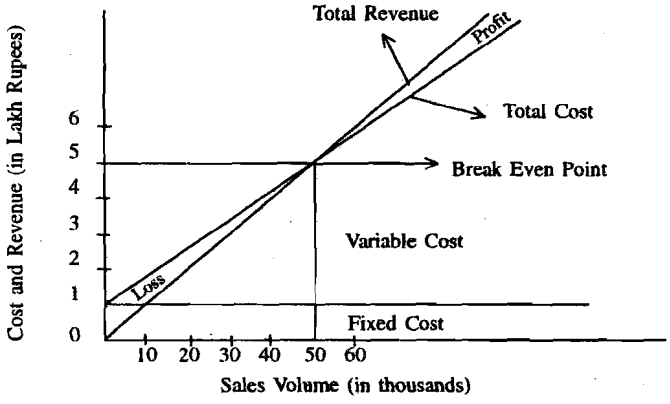

Fig. 3.2

problems can be analysed and solved. There are four steps in applying this scientific approach:

—Formulate and define the problem,

—Construct a mathematical model,

—Test the model and solution derived from it, and

—Put the solution to work (implementation).

Specific OR techniques include:

1) **Linear Programming:** A technique for determining the optimum combination of limited resources to obtain a desired goal. It is based upon the assumption that a linear, or straight line, relationship exists between variables and that the limits of variations can be determined. For example, in a production shop like laundry, the variables may be units of output per machine in a given time, direct labour costs or material cost per unit of output, number of operations per unit, and so forth. Most or all of these may have linear relationship, within certain limits, and by solving linear equations, the optimum in terms of cost, time, machine utilisation, or other objectives can be established. Therefore, it is useful in production planning, and the utilisation of production to acheive lowest overall costs.

2) **Computer Simulation:** Evaluation of alternative courses of action without direct experimentation.

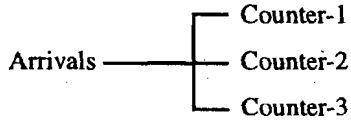
3) **Inventory Models:** Problems regarding storage capacity, quantities to be ordered, and when to be ordered can be attended by using inventory models.

4) **Work study:** Determining the standard time necessary to carry out an activity, developing effective and easy methods of work.

5) **Queuing Techniques (waiting times):** Determining waiting time, cost of waiting time and its reduction, identification of bottlenecks. This technique can be used to analyse alternatives and arrive at solutions to many of these problems. It is necessary to know how often patients arrive; how long it takes to service them, and the order in which arriving patients are served with these data the waiting time problem can be solved.

A simple method of studying a queue line is described below:

A multiserver queue in a service area is represented as:



The following observations are made at intervals of selected unit time:

Time (hrs/min)	Unit time	Queue length (persons waiting)	Number served in unit time	Number of counters open
	T	Q	N	C

From these observations following can be calculated

Individual service time (i.t) $\frac{T \times C}{N}$ (e.t.xc.)

Effective service time (e.t.) $\frac{T}{N}$ (minutes)

Waiting time (w.t) $Q \times e.t.$

Capacity (C) $\frac{60 \text{ min}}{e.t.}$

Those values depict the time spent by an individual at each counter and the capacity of the service point, which are useful in making decisions regarding allocation of time, personnel and equipment so that both idle periods and waiting time can be minimised. They also facilitate inter-service and inter-hospital comparisons.

The queueing technique can be applied in various patient care areas—Outpatient department, Radiodiagnosis and Imaging, Operations (Surgery) etc.

A) Prevalent system in OPD:

Consultation Chamber Number:	1	2	3	4	5
Patients:	1–8	9–17	18–26	27–35	36–43

B) Modified system in OPD:

Consultation Chamber Number:	1	2	3	4	5
Patients allotted as per arrival:	1	2	3	4	5
	6	7	8	9	10
	11	12	13	14	15

Activity 1

Do a small survey of hospitals and try to study the extent of use of OR techniques in the management of hospitals and supporting services. Prepare an evaluative document on the topic and discuss in the peer group regarding the strengths and weaknesses of the system.

3.7 PERT (PROGRAMMING EVALUATION REVIEW TECHNIQUE)

PERT is a technique of representing a project plan in a network form. It starts with the determination of objectives, specifying clearly as to what is to be achieved and ends with the completion of the project. Any project, therefore, has to be analysed in depth and inter-relationships of the steps in the project determined in details. This is then represented in a graphic form known as Network Diagram. Thus a network diagram of activities is the key feature of PERT and acts as a ROAD MAP to reach the objectives of the programme or project.

PERT helps in:

1) Defining clear cut objectives
2) Analysis of the strategy
3) Preparation of a detailed plan of action
4) Sequencing of events
5) Focussing on more important activities
6) Planning for time schedules
7) Continuous monitoring of the progress.

Example

Activity	Event
A—Prepare patient	Patient prepared
B—Give Anaesthesia	Anaesthesia given
C—Prepare instrument trolly	Instrument trolley laid
D—Perform operation	Operation performed.

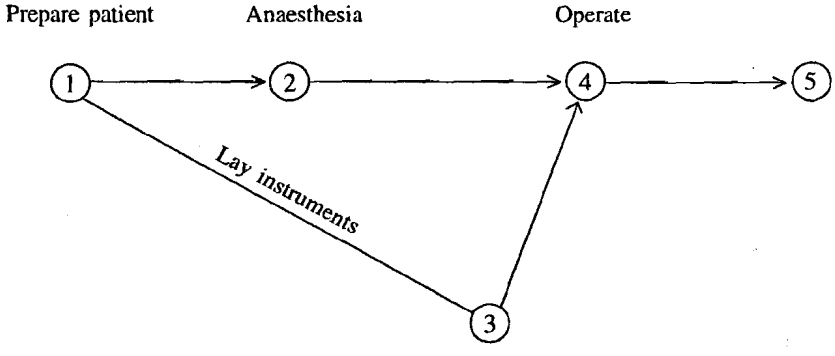


Fig. 3.3: PERT Activity Analysis

3.8 STRATEGIC PLANNING

Planning provides direction and a sense of purpose for the organisation. It also provides a unifying frame work of decision (–) making throughout the organisation. Planning helps to reveal future opportunities and threats and also facilitates control.

Planning usually involves at least two phases—Strategic Planning (aimed at developing the organisation's basic long-term plan, or strategy, and Action Planning (Short term objectives are developed for each department, short run forecasts are made, alternative action plans are developed and analysed, and specific ones are chosen).

Steps in developing a strategic plan include:

—Clarify the organisation's domain, in terms of services it offers and to whom,

—Make a strategic forecast

—Determine current strengths and weaknesses

—Develop alternatives and analyse each in terms of organisation's strengths, weaknesses, threats and opportunities.

—Set specific objectives, commence action planning.

The strategies of a hospital need to be well conceived, practical and commitment oriented. Strategic planning will help administrator to develop a better image for the hospital and that the hospital services will achieve the desired results for the community.

3.9 FORECASTING

It is a service whose purpose is to offer the best available basis for management expectations of the future and to help management understand the implications for alternative courses of action. Forecasting provides the basic premises or assumptions on which objectives, strategies and plans are built.

Forecasting techniques include:

- Economic forecasting
- Time series (exponential smoothing)
- Casual

  —multiple linear regression

  —econometrics
- Qualitative

  —judgement

  —delphi method (technological forecasting research

  —marketing

Activity 2

Please visit atleast two hospitals within your reach (one private and one public/ government) and try to find out what kind of forecasting is being practiced at the organisational level. Prepare a brief critical paper on the topic.

.....

.....

.....

.....

.....

.....

.....

.....

.....

3.10 VALUE ANALYSIS

Value analysis is a technique to provide various types of models to management for taking decision as to which service a hospital can offer and at what cost, and thus it helps in making decision regarding planning the facilities and services the hospital will offer. The hospital funds can be effectively allocated and better utilised for those services that can satisfy many patients with marginal change.

3.11 STATISTICAL QUALITY CONTROL

Hospital can generate a large number of individual statistics where each statistics is a measure of some limited aspect of quality or efficiency of the total process. An affective information-handling system must be able to process the incoming statistics. Almost any complex process will have some variability in the degree to which it achieve its goal. Thus, there should be three or more observations in each set. For each of these sets, the mean and standard deviation can be estimated according to the usual formula.

The end product of the hospital is "Patient Care" and the product being intangible does not lend itself to measurement easily. Lately, four criteria have been developed which are used for measurement:

Parient Care	:	Number of OPD Cases Number of admissions Number of operations Number of tests
Quality	:	Patients cured Improved Infection/Complication
Cost	:	Per day per patient (in-patient/out-patient)
Patients satisfaction	:	Random patient opinion/survey staff satisfaction etc.

Activity 3

Taking cue from the above illustration, conduct a small study of a hospital and examine the four group of services referred above regarding their quality control.

.....

3.12 MANAGEMENT BY OBJECTIVES (MBO)

MBO is a process whereby the superior and the subordinate managers of an organisation jointly identify its common goals, define each individual's major areas of responsibility in terms of the results expected of him, and use these measures as guides for operating the unit and assessing the contributions of each of its members.

The concept rests on a philosophy of management that emphasizes an integration between external control (by managers) and self-control (by subordinates).

The goals are jointly established and agreed upon in advance. This is then followed by a review of subordinated performance in relation to accepted goals at the end of the time period. Both superior and subordinate participate in this review.

3.13 QUALITY CIRCLES (QC)

QC is a people building philosophy capable of providing astonishing results. QC is a small group of people doing similar or related work who meet regularly to identify, analyse and solve quality, productivity, cost-reduction, safety and other problems in their work area, leading to improvement in their performance and enrichment of their worklife. Membership is voluntary (6-12 members) who meet on an average one hour once a week.

Objectives

—Cost reduction

—Reducing employee turnover

—Improving employee morale

—Greater efficiency of operations

—More effective scheduling

—Reduced absenteeism

—Improve nurse-clinician relations

—More accurate cost-allocations

Significance of QC's lies in utilising the education, experience and creativity of the staff in hospital problem solving and decision making. QC is an integrated programme made up of:

—The members themselves

—Circle leaders

—The facilitater

—The Co-ordinator

—Steering committee (group of key individuals selected from management, circle leaders and members of all major functional areas).

Process

—Problem identification

—Problem selection

—Problem analysis

—Implementation and recommendation to the management

Implementation

—Establish atmosphere

—Obtain commitment

—Select objectives

—Inform

—Voluntary

—Training

—Be open and positive

The key to success is a good implementation plan

The concept of QC envisages participatory management style with a "Bottom Up" approach.

Activity 4

As a professional in the health care management system, have you ever come across a quality circle. If yes, please evaluate critically its functioning and discuss in the professional group you belong to and prepare a short note.

3.14 MANAGEMENT PROBLEM SOLVING METHODS

The organisational ability can be improved by the use of Management Problem Solving Methods (MAPS). The problem solving, the case study approach, involving actual or contingency situations is suitable for all management levels.

Units of Analysis:

1) Overall organisation
2) Resources flow
   —Personnel
   —Funds
   —Equipment
   —Information flow
   —Types of patients
   (infection rates, medication errors, patient waiting times)
3) Work group
4) Organisational environment
   (Including social, economic and technological factors)

With the analysis of data provided in these categories the organisation unit has available performance criteria which can be used to illustrate its percentage success in providing a service to the patient. This will show how efficiently organised the hospital is in providing a service to the patient. MAPS can be applied to organise hospital equipment maintenance.

3.15 MANAGERIAL SKILLS

There are three general categories of skills that managers must possess: technical skills, human skills, and conceptual skills.

Technical skill: Ability to use knowledge, methods techniques and equipment necessary for the performance of specific tasks acquired from experience, education and training.

Human skill: Ability and judgement in working with and through people, including an understanding of motivation and an application of effective leadership.

Conceptual skill: Ability to understand the complexities of the overall organisation and

where one's own oepration fits in the organisation. This knowledge permits one to act according to the objectives of the total organisation rather than only on the basis of the goals and needs of one's own immediate group.

Research has shown that managers at different levels require varying amounts of technical and conceptual skills in order to carry out their responsibilities effectively. Human skills are a constant at all levels and occupy the greater part of the management function.

3.16 COST ANALYSIS

The growing complexity of hospital operation both in size and volume, increase in demand for high standard of medical care services requires systematic use of hospital accounting system in general and cost accounting in particular (Fig. 3.4).

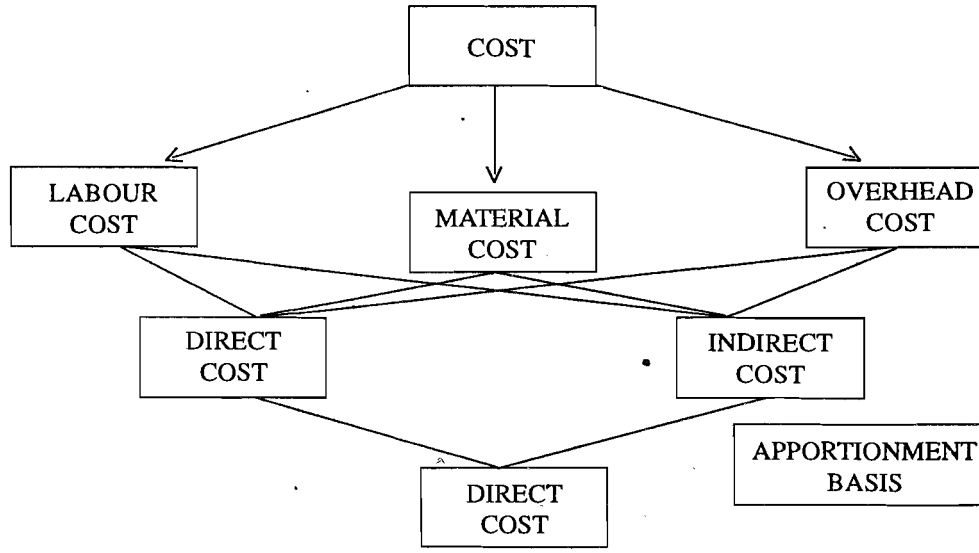

Fig. 3.4: Framework of the Cost Analysis

The process of cost analysis has become a resource tool for financial management in hospitals. The cost of operating different services are allocated to different cost centres. Costing also helps to assess the efficiency and effectiveness of functions and their cost implications with a view to contain cost. The exercise of unit costing involves the determination of the cost of single unit of any product or service. The approaches to unit costing are:

a) Standard costs (gives an estimate of what the costs should be i.e. it accumulates the costs incurred for all material and labour component of a product/service and provides allowance for any normal wastage. Scientific methods like time and motion studies can be used to compute the cost).

b) Average costs (indicates the actual average cost of providing one unit of service. This is a top down approach, where the total costs of the service centre are determined and divided in a rotational proportion among the different services offered—thereby deducing the cost of providing a unit of service. The wastage component cannot be determined by this method and hence there is no comparison standard).

3.17 UTILISATION MANAGEMENT

It is a hospital-wide multidisciplinary programme which helps a hospital to achieve its objectives for cost control and overall institutional management. It is a catalyst for coordinating quality assurance, utilisation review and risk management activities. Cost-effectiveness is accomplished through the judicious use of resources to control inappropriate in-patient admissions, length of stay and use of ancillary.

Utilisation review is the process of assessing medical care to ensure its quality, medical necessity, and appropriateness in terms of level of care and treatment setting. It has emerged as a key feature of cost management.

3.18 LET US SUM UP

Health care professionals must become effective managers and leaders in order to fulfil their responsibilities to themselves, to their patients, and to the professions. Existing environments, roles, educational programmes are expanding. In the changing environment hospital administrators will be called upon for creative strategies, disciplined and cost-controlled programmes, improving the quality, raising the standards, and the abilities to direct research and analyse systems critically, and chart growth.

Contents in this unit focus on increasing organisational effectiveness in service and practice by applying modern technique in hospital management. The educational process attends to the unique individual learner. A satisfied manager has a high probability of having staff members who are also satisfied; satisfied staff members have a high probability of having satisfied patients; a satisfied patient has a high probability of reaching full health potential.

3.19 SELF-ASSESSMENT TEST

Having gone through this unit, you should talk to some of your professional colleagues who are operating their own health care organisations and find out the following:

1) Do they know about the management techniques, which we have talked about in this unit?
2) In case they know, how useful are they in their day to day management?
3) What else would they like to know about management techniques?

or

What are their needs and work out yourself as to what more do they require to know?

Prepare a brief account of your findings and discuss among peers, either in classroom situation or at professional gathering.

UNIT 4 ORGANISATION STRUCTURE AND DESIGN

Structure

4.0 OBJECTIVES

After going through this unit, you should be able to:

- appreciate the basic elements of an organisation structure;
- differentiate between formal and informal organisation structures;
- explain various factors impinging upon the design of an organisation;
- evaluate the advantages and disadvantages of the various types of organisational structures; and
- understand the issues involved in designing a service organisation.

4.1 INTRODUCTION

Organising is the formal grouping of activities and resources for facilitating attainment of specific organisational objectives. It is possible to achieve objectives without formally organising, but there is likely to be great wastage of resources and time. Organising ensures that objectives are achieved in the shortest possible time, in an orderly manner, with maximum utilisation of the given resources.

In the context of a firm, its people, machines, building, factories, money and credit available for use are the resources at its disposal. All these resources are limited. Your role as a manager is to organise all these resources, so that there is no confusion, conflict, duplication or wastage in achieving your organisation's objectives. You will be required to allocate to each person his role, designation and position in the organisation, his responsibility for achieving specific objectives and authority for utilising the resources assigned to him, and the higher authority to whom he has to periodically

report his progress. In this unit, we will take up all these issues for discussion, dwelling at some length on the various types of organisation structure that you can choose from to suit your company's specific objectives.

4.2 ORGANISATION STRUCTURE AND CHART

Organisation structure refers to the formal, established pattern of relationships amongst the various parts of a firm or any organisation. The fact that these relationships are formal implies that they are deliberately specified and adopted and do not evolve on their own. Of course, it may sometimes happen that given an unusual situation, new working relationships may evolve and which may later be adopted as representing the formal structure.

The second key word in our definition of structure is 'established'. Only when relationships are clearly spelled out and accepted by everyone, can they be considered as constituting a structure. However, this does not mean that once established, there can be no change in these relationships. Changes may be necessary with passage of time and change of circumstances, but frequent and erratic changes are to be avoided. A structure can be based on relationships only if they exhibit a certain degree of durability and stability.

The structure of a hospital is of extreme importance, because the objectives of the hospital are achieved with the help of the available medical technology by the administrator through the organisational structure of the hospital. Structure may be considered as the established pattern of relationships among the components or parts of the organisation. As suggested earlier, hospital as an organisation has a lot of components namely emergency department, outpatient department, wards, nursing services, pharmacy, lab and pathology services, radiology department etc. The larger the hospital is, the more complex will be the relationship between these different components. In order that the hospital administrator is able to plan, coordinate and supervise the activities of these components, it is important that their relationships are properly established and an authority-responsibility-accountability system is provided for each of these components.

Structure is frequently defined in terms of (1) an organisation chart and job description, i.e. formal relationship of people in the organisation and their duties; (2) the way by which various activities or responsibilities are assigned to departments or people in the organisation; (3) the way by which these activities are coordinated; (4) the power and hierarchical relationships and (5) the planned or formalised policies or procedures and controls that guide the activities and relationships of people in the hospsital. This is generally called the formal organisation. Apart from this, many informal, unplanned and spontaneous relationships occur in a hospital where the formal structure is not strictly followed. This is called the informal organisation.

Structure provides a very important work for authority relationships. In other words it defines as to who has the authority to give instructions to whom, when, and where and who should take instructions from whom and be accountable to whom, when and where. Thus the authority structure provides the basis of assigning tasks to the various elements of the hospital and to develop a control mechanism to ensure these tasks are performed according to the plan. So in a hospital the administrator assigns specific tasks to each of these units or departments and the heads of these departments in turn assign duties and responsibilities to the members of their units. The authority vested in each position in the structure is impersonal and it goes with the position rather than with the person. The heads of the various units have the right to evoke compliance by subordinates on the basis of formal position, and control over rewards and sanctions. The person with certain responsibilities to carry out an activity is also given the necessary authority. This is the basis for supervisor-supervisee relationship or the boss-subordinate relationship.

The formal relationships in an organisation are those as described in an organisation chart. Fig. 4.1 represents a typical chart for a health care organisation. The boxes in the chart represent the various important positions in the organisation. The title of the position indicates the activities involved at that level. The distance of the box from the

top indicates its position in the hierarchy. The closer the position the higher its status and vice-versa. The lines joining the various positions represent the formal reporting relationships usually between a superior and a subordinate. Fig. 4.1 represents the organisation chart of **National Leprosy Eradication Programme.**

National Leprosy Control Programme was launched in 1955 with monotherapy. The leprosy cases, however, kept on increasing and in 1981 there were 4 million cases in India out of the 12 million patients estimated throughout the world. National Leprosy Eradication Programme (NLEP), with the introduction of multi-drug therapy in 1981, was redesigned in 1983. NLEP has shown the result as an efficient organisation and the prevalance rate of leprosy decreased from 57 per 10,000 in 1981 to 10.5 per 10,000 in 1994. The ultimate goal of NLEP is to reduce the prevalence rate to less than 1 per 10,000 by the year 2000 A.D. The organisation chart of NLEP as shown in Fig. 4.1, therefore, has been working well and proved to be effective.

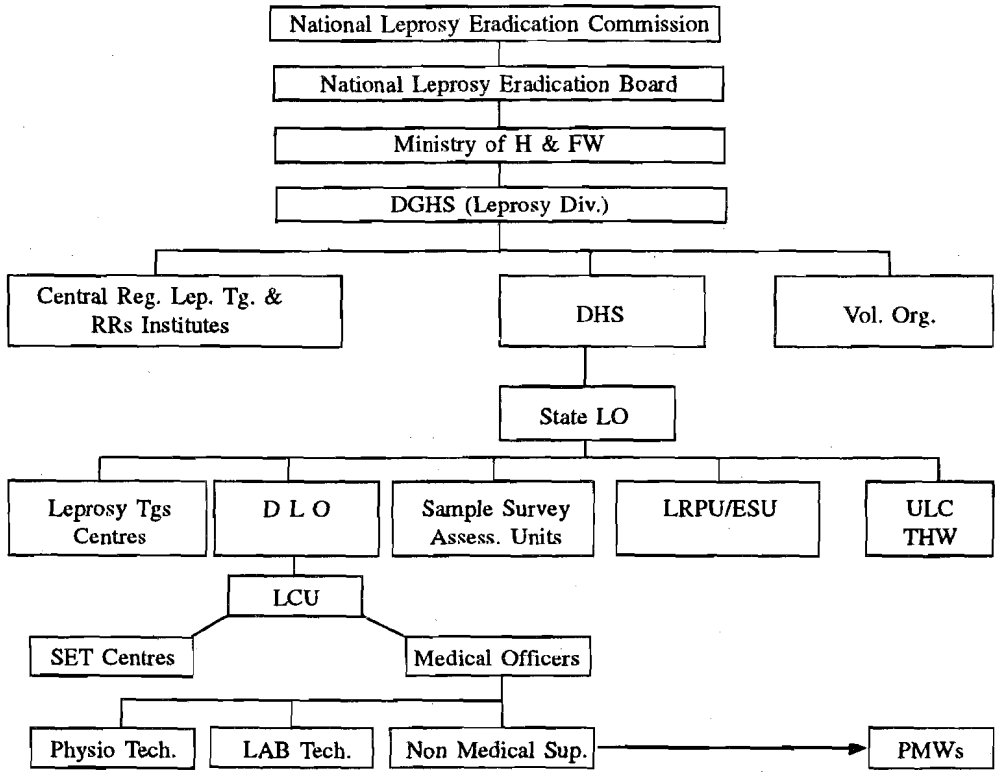

Fig. 4.1: Organisation Chart of National Leprosy Eradication Programme (NLEP)

The organisation chart is a rather abstract illustration of the structure. To get a more complete picture, the chart may be supplemented by job descriptions of each position. The job description gives in detail the activities and responsibilities expected of the person occupying the position.

Both the organisation chart and job description are simplified abstractions of the actual situation. In reality there are many more positions and relationships than indicated in the organisation chart. The degree of authority a superior has over his subordinate is also not indicated in the chart; nor is the relationship between two managers at an equal level reflected in the organisation chart.

Despite all these limitations, the organisation chart is an extremely useful tool in understanding and designing the structure. The structure of an organisation, unlike that of a physical, mechanical or biological system, is not visible. Therefore, it can only be understood by a representative model and by observing its behaviour.

Activity 1

Draw the organisation chart of your organisation. Clearly mark your position in the structure and draw the lines depicting the reporting relationships between you and your immediate boss and immediate subordinate.

The elements of an organisation structure are:

i) the network of formal relationships and duties, i.e. the organisation chart plus the job descriptions,

ii) the manner in which various tasks and activities are assigned to different people and departments (differentiation),

iii) the manner in which the separate activities and tasks are coordinated (integration),

iv) the power, status, and hierarchical relationships within the organisation (authority system),

v) the planned and formalised policies, procedures and controls that guide the activities and relationships (administrative system), and

vi) the flow of information and communication network.

The network of formal relationships has already been discussed. Before we get into a detailed description of the specific elements of an organisation structure, it would be useful to differentiate between formal and informal organisations and the factors affecting the design of structure.

4.3 FORMAL AND INFORMAL ORGANISATIONS

If you and your colleagues decide to meet every Saturday evening for one hour and form a recreation club to play chess and carrom, you are meeting in an informal organisation. However, when the same group of your colleagues meets to review the last quarter's performance and plan for the next three months it is in the context of a formal organisation. Thus, while the informal organisation is spontaneous, the formal organisation is the result of a deliberate and planned effort to pattern activities and relationships in a specific manner to facilitate achieving the specified objectives. A formal organisation is the result of explicit decision-making, deciding how people and activities should be related to one another, However, there is no such decision-making involved in an informal organisation which may simply evolve over time.

In the context of a business organisation, both the formal and the informal organisations operate together to form the total organisation. The formal structure delineates specific departments, activities, people and their reporting relationships. The informal structure refers to the social groups or friendships which people working together may form.

A most important aspect of the informal organisation is the informal communication network or 'grapevine' as it is more commonly known. If you analyse the communication network in your organisation, you would realise the amount of information you gather from official circulars, memos and speeches is rather insignificant compared to what you unofficially learn from your colleagues, your subordinates and even your peons. The grapevine constitutes an extremely important component of the organisational information system. How often you have been able to avert a crisis much before it actually erupted because the information about the impending crisis was conveyed to you by the grapevine?

Besides the grapevine, the other manifestation of the informal organisation is the formation of groups which may spontaneously evolve when the formal organisation is slow to respond to changing external and internal forces. But sometimes these informal groups may also work against the formal organisation. This may happen when an informal group of workers may force other workers to lay down tools, or work to rule or generally pose impediments in the path of progress.

Sometimes the norms and work ethics evolved by the informal organisation take precedence over the official norms. The head of the market research division of a large multi-national company involved in manufacturing and marketing a wide range of consumer products, would always spend three to four hours every Saturday morning in office, even though Saturday was officially a holiday. Observing that the departmental head worked on a holiday, his immediate subordinates also felt obliged to be in office every Saturday. The manager did not expect it from his subordinates, but the latter felt that by doing so they would be creating a favourable image for themselves in the eyes of their boss which would help them in their promotion within the formal organisation.

Similarly, you would find informally evolved values operating within the parameters of the formal organisation. These values may relate to dress, employment of women, employment of members of a minority community, etc. in understanding the structure of an organisation, you must understand the important role played by the informal organisation within the formal organisation.

Activity 2

List all the informal organisations in which you regularly participate. What are the activities undertaken by these informal organisations?

.....

.....

.....

.....

.....

4.4 FACTORS INFLUENCING THE CHOICE OF STRUCTURE

As a manager, it is your job to design a structure that will best suit the specific requirements of your organisation. Designing an organisation structure is a continuous process. What seems to be the ideal design today may tomorrow prove to be totally ineffective. It is your task as a manager to be continually improving the structure of your organisation. Any change in factors which impinge upon the design of an organisation will necessitate a change in the structure to suit the new conditions.

Impact of Environment

The first factor affecting the design of your organisation structure is the environment. An organisation is continuously interacting with its environment in terms of drawing inputs from it and providing it its outputs. All organisations operate within an environment which comprises economic, social, cultural, political and legal sub-systems. A change in any of these sub-systems may force you to change the design of your structure. Change in Government regulations regarding foreign equity

participation in India made it imperative for the most foreign owned companies to dilute their holdings and become more national in character. Increasing awareness about personal rights and social pressure on maintaining the natural state of environment have forced many companies to set up Personnel Welfare Departments and instal expensive equipment to neutralise the toxic effluents generated in their manufacturing process. You might have noticed that banks have instituted a process by which public complaints can be tackled at the highest level. Some of the bank managers and chairmen even set aside specific timings when they give a personal hearing to individual grievances.

The Environment of the Hospital

The hospital as a system, being part of the total environment, receives its objectives from the environment. With the help of the resources (inputs like medically trained and qualified personnel, equipments, buildings, tools, medicine etc.) the hospitals are expected to help the environment meet the objectives of curing and preventing diseases in the society. Each hospital is expected to cater to the health care needs of a particular area. It is this boundary that the hospital unit caters to and exists for. At the same time, the health care unit also receives input from the entire environmental supra system, which is the society at large, through the governmental machinery.

But the boundaries of a hospital cannot be specifically determined because quite often people who are far away from the catchment area of that hospital may also seek the services of that particular hospital for strictly personal preferences or because of greater specialisation or expertise of the hospital.

So the immediate task of the hospital administrator is to try to get to know the characteristics of the environment of the hospital in relations to its health needs and to get ready to meet these needs to the extent of the facilities available to him. This is where the hospital administrator will be able to plan and be ready for the likely emergencies which might develop at any time. He might be interested in the morbidity pattern of the area, the infant and adult mortality rates, the availability of other health care units (private or voluntary), access to more than specialised hospitals nearby, possibility of importation of communicable diseases etc. When these are compared with the resources at the disposal of the hospital, the administrator will be in a position to seek additional help from the higher authorities, voluntary agencies and the community at large, in order that the expectations placed on the hospital by the environment can be adequately met.

Goals

Hospitals like any other organisations have specific goals to achieve, or tasks to accomplish. These goals are the very foundation of the hospitals. These goals are, as indicated above, set forth by the environment and are placed on these hospitals. Quite often these goals are broad. These are to be narrowed down in the form of achievable, specific goals, so that the administrator can make plans to achieve these goals. So when a hospital is expected to cure and prevent diseases, it would mean (1) a very efficient casualty department to take care of emergencies, (2) a highly effective outpatient department to treat common diseases, (3) necessary in-patient facilities to cater for the needs of those who require longer treatment with greater personal care and with necessary lab services and other para medical services. Thus the broad objectives are now divided into the specific objectives of the various units or sub-divisions of the hospital. This will lead to the administrator to set specific objectives for the units. When all these objectives of the sub-units are properly achieve, that would mean that the objectives placed on the hospital by the environment are achieved. The successful administrator of a hospsital is one who is able to view things in this line and to develop his style accordingly. This would mean that the cure ratio of the hospital goes up and the rate of prevention of communicable diseases is very high. Thus achievements of the set goals would be the best criteria in evaluating the performance of the various categories of medical and paramedical staff in the hospsital, the hospital administrator as a manager, and the hospital as an organisation.

Impact of Technology

The second factor affecting the structure of your organisation is the technology that you have adopted. To begin with, each pair of shoes was made by a single cobbler who probably spent four to five days on the entire process. With the concept of specialisation and division of work, organisations, instead of being designed around individual craftsmen, were structured on the basis of different people doing only a specialised part of the entire process of shoe-making. This concept was further refined with the introduction of automation and assembly lines. Now with the introduction of computerisation and robots, new structural designs are once again emerging. Entire plants are manned by a single operator who controls the operations through computers. Major human inputs are needed in designing computer controls and software rather than in performing repetitive jobs.

Once the environmental forces are clearly understood and the organisational and individual goals are set, it is important to understand that in order for the objectives to be achieved the organisation is expected to use a broad set of technology. By technology is meant that organisation and adaptation of scientific knowledge for practical purposes. So in a hospital, technology includes not only stethoscope, forceps, syringes, needles, x-ray machines etc., but also diagnostic techniques and processes used in identifying and curing the sick. Thus even though the technology used in the hospital may be broadly called medical technology, it includes various techniques and tools in preventing a patient from getting worse or controlling the basic causes of a disease and completely curing the patient. This is why even psychological counselling or a psychotherapy are considered to be part of the overall medical technology.

But this does not mean that all health care units are using all the different types of medical technologies available. The technology selected depends on the environment of the hospital, the morbidity pattern and the mortality rates, the available resources like tools, equipments and other physical facilities, the qualification and experience of medical personnel available etc. This is where the role of the hospital administrator as a full-fledged manager comes up. He is able to adapt the available technology to meet the particular cases which are brought to his hospital, and those which he is not able to treat because of the resource pattern, are referred to the nearest better equiped hospitals. It is worth mentioning here that the determination of the goals or objectives (achievable objectives) of a hospital to a very great extent depends on the available technology.

Impact of Psychosocial Characteristics

The changing psychosocial characteristics of the workers is the third factor impinging upon the design of the organisation structure. Greater demand for leisure time led to the introduction of the five, and in some places, even the four-day week. Our country has also recently adopted a five-day week. Greater awareness about worker rights and use of more militant means to earn those rights have led to the widespread formation of trade unions in almost every organisation. Some companies have had to redesign their structure in order to give a formal recognition to the unions.

The three factors that we have discussed so far are external to the organisation and its management. However, there are some attitudes and values of the management which have a critical bearing on the structure of an organisation. Most important of these are the management's attitude towards the issues of decentralisation and delegation of authority and the role and function of line and staff personnel. Also affecting the organisation structure are the scalar principle and span of control.

4.5 DEGREE OF DECENTRALISATION

Centralisation refers to the concentration of authority and decision-making in one single position in the organisation. In a one-man enterprise, the entrepreneur makes all the decisions and all the authority and decision-making power is vested in him. With the expansion of business, it may no longer be possible for one man to control all the operations and may become necessary for him to delegate some responsibility and authority to another person. Delegation implies that you are acting on behalf of your boss by virtue of the power which he has given to you. The greater the delegation of power the greater is the extent of decentralisation in the organisation.

You will find that some companies, even though physically very large, have highly centralised structures. All decisions are taken by the top management, with the middle and operating level managers having little or no say in running the show. On the other hand, you may find that even in a relatively small organisation, there is greater delegation of power and the structure is very decentralised. The degree of decentralisation in an organisation is partly a manifestation of the top management's attitude. Some managers do not like to delegate even the smallest task to their subordinates. There may be a variety of reasons for this. Doing all the tasks himself may give the manager a great sense of power, or he may feel that the subordinate is incompetent and may commit mistakes.

Total centralisation, however, is never desirable as it may bog down the manager in routine, trivial tasks and leave him no time for planning the company's future. An effective manager would decide the issue of centralisation versus decentralisation on the basis of the requirements of the situation rather than his own personal bias.

Decentralisation is effective when:

- conditions in each market are so different that only a high degree of adaptation to local conditions will lead to success. Multi-national companies with subsidiaries in many different countries are a typical example.
- success depends on the quick response to the information and conditions generated at the local level. Companies dealing in stocks and shares or international currencies require speedy response to the fluctuating prices for getting the best returns
- active participation of people in the planning and implementation of objectives is conducive to good performance. An engineering company manufacturing electrical switching equipment sells mainly to the State Electricity Boards (SEB) through the tender system. Each tender requires close monitoring and personal follow up at each stage till the final award is made. Realising that personal rapport with individual SEB is important, the company has fully decentralised local offices in each city where the SEB is located.

The introduction of computers and real time information has influenced the concept of centralisation in an organisation. Information may be generated at the factory, but it is instantaneously transmitted to the decision-maker (even if he is located 10,000 kms away) for suitable action, information may be processed and used at the place where it is generated or it may simply be passed on to another location for use in decision-making. Real time information can lead to greater centralisation or decentralisation.

The degree to which a firm decentralises its structure depends on the requirement of its unique situation. Also, a firm may not decentralise all its operations, but go in for only partial decentralisation. Functions which facilitate local adaptation, quick decision-making in response to local changes and strengthen worker participation should certainly be decentralised. On the other hand, functions involving economies of scale, utilisation of specialised knowledge and involving huge sums of money may remain centralised. Finally, the degree of decentralisation also depends on the availability of competent and reliable people to head the independent operations.

4.6 LINE AND STAFF RELATIONSHIPS

The role of line and staff personnel is the other issue to be decided in the context of designing your organisation structure. Traditionally, any function which directly contributed to the organisation's objectives was viewed as a line function. Staff functions were those which helped line functions to perform more effectively. However, an important point to note about line and staff is that in the former there is a direct relationship of command from superior to subordinate while in the latter the relationship is more advisory in nature. There are some traditional principles which have greatly influenced the concept of organisation structures. The most important of these are specialisation of work, scalar principle and span of control.

Activity 3

Evaluate critically your organisation in terms of whether it is a highly centralised or decentralised structure. If you were made the head/CEO of the organisation what kind

of a structure would you adopt? Describe in detail the functions which you would centralise and those you would decentralise.

4.7 SPECIALISATION OF WORK

A very basic and traditional principle of organising is to break down a task or process into smaller, more manageable tasks which call for utilisation of special skills. This concept of work specialisation and division of labour was the forerunner of assembly lines. This is indeed a useful principle in so far as it allows a worker to concentrate on that activity at which he is most proficient. But in many situations, this concept has been carried too far and jobs of workers have become so fragmented and trivial that a worker's job may be reduced to putting a screw on a bolt and simply tightening it.

Scalar Principle

Scalar principle and unity of command are two closely related principles. The scalar principle states that authority should flow in a straight line from the superior to the subordinate in a hierarchical manner. The principle of unity of command states that ideally each subordinate should have only one superior. These two principles establish the basic hierarchical nature of an organisation.

4.8 SPAN OF CONTROL AND LEVELS OF MANAGEMENT

Closely related to the concept of hierarchical structure are the concepts of span of control and levels of management. Let us understand these with the help of an example.

In 1975 Mrs. Das, a housewife living in Bombay, started making garlic chilly sauce at home and selling it to her close friends, relatives and neighbours. The sauce became quite popular and Mrs. Das began receiving many orders, including two from the nearby Chinese restaurants. Unable to cope with so much work she hired Indrani as an assistant. This was the first step in delegating authority and creating another level of management. Existing customers now had to deal with Indrani as Mrs. Das herself concentrated on preparing the sauce and tapping potential new customers.

A year later Mrs. Das hired one girl to help in the kitchen, two girls to assist her in making sales calls and one office assistant for Indrani. Now authority had to be delegated in the kitchen as well as in making sales calls and hence two levels of

management were created in the kitchen and sales. The new office assistant reported only to Indrani, who in turn reported to Mis. Das and thus there were three levels of management in administration. Span of control refers to the number of people a manager has to control. Now Mrs. Das's span of control extended to four people (Indrani, one kitchen assistant, two sales assistants) and Indrani's span of control was restricted to only one. By 1980, the small sauce making enterprise had shifted to a shed in the near v industrial estate, with a full-fledged production facility consisting of 10 people and a sales team of 16 girls, divided into 4 territorial teams supervised by a sales manager and an office administration set up of 25 people.

Mrs. Das's organisation as it evolved is shown in Figs. 4.2-4.5.

EVOLUTION OF AN ORGANISATION

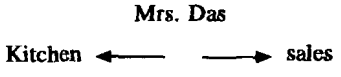

Fig. 4.2: Flat Structure

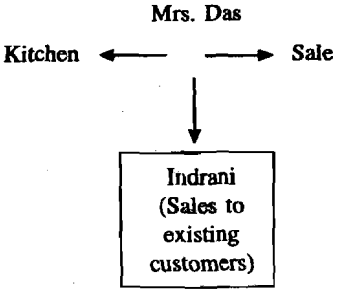

Fig. 4.3: Level Structure

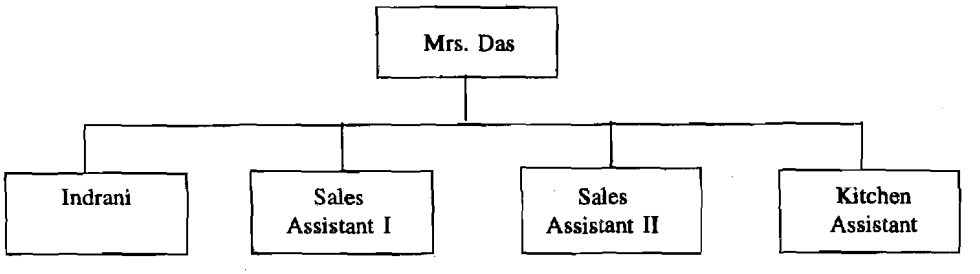

Fig. 4.4: Growing Structure

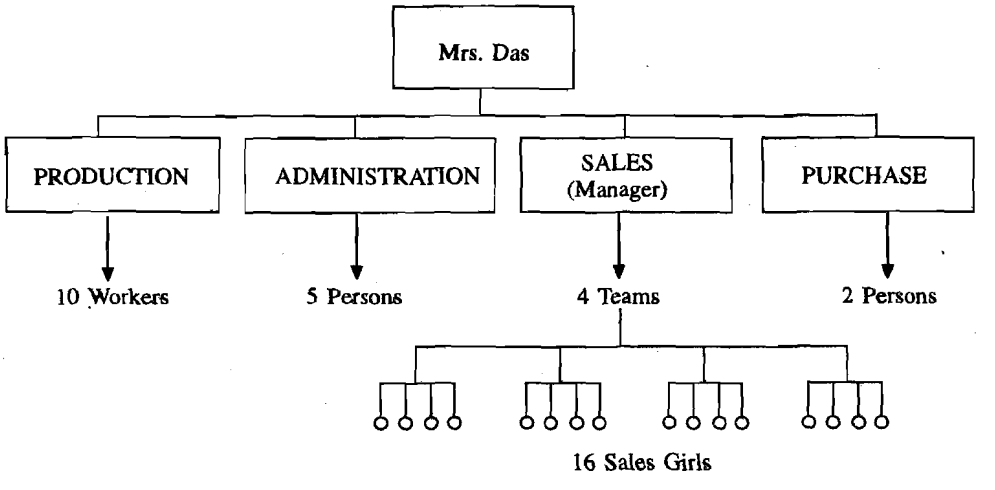

Fig. 4.5: Vertical Structure

Starting out with a relatively flat organisation where Mrs. Das was in direct contact with all her customers and suppliers, her organisation had acquired many levels of management and a vertical structure by 1980.

As an organisation adds on levels of management it becomes vertical and the span of control at each level becomes narrow. In a flat organisation, the span of control is relatively wider and levels of management are few. The flow of information in a flat organisation is fast and there is greater individual satisfaction and it is the ideal structure for conducting research and development and new product development groups.

There is a great deal of controversy regarding the optimum number of people a manager can effectively manage or the ideal span of control. The important factor is not the number of people whose work a manager has to control but the number of people he actually has to work with. On paper the marketing president may have 35 area sales managers under his span of control. But since he does not have to interact with them individually more than once in six months, and all other interactions including the regular reports are through the vice-president (sales), the system works well. In practice, there is no 'ideal' span, it will vary from individual to individual and from one organisation to another.

Similarly there is no hard and fast rule governing the levels of management. Too many levels only add unnecessary complexity because decisions, information and instructions must go through too many channels. Each organisation has to find its own ideal balance.

4.9 MATRIX STRUCTURE

The matrix structure is a combination of the product and functional organisation and is usually created for executing a project which requires the skilled services of a functional man as well as the specialised knowledge of a product man. Large turn-key projects in specialised fields require a matrix structure. Fig. 4.6 illustrates a matrix structure.

The distinguishing characteristic of a matrix structure is that it operates under a dual authority. A person is accountable to two bosses at the same time, one his usual boss and the other his boss for the duration of the project (e.g. Ward Management). Obviously the problems emanating from this type of structure relate to conflicting roles and authority arising out of an ambiguous demarcation of authority and responsibility.

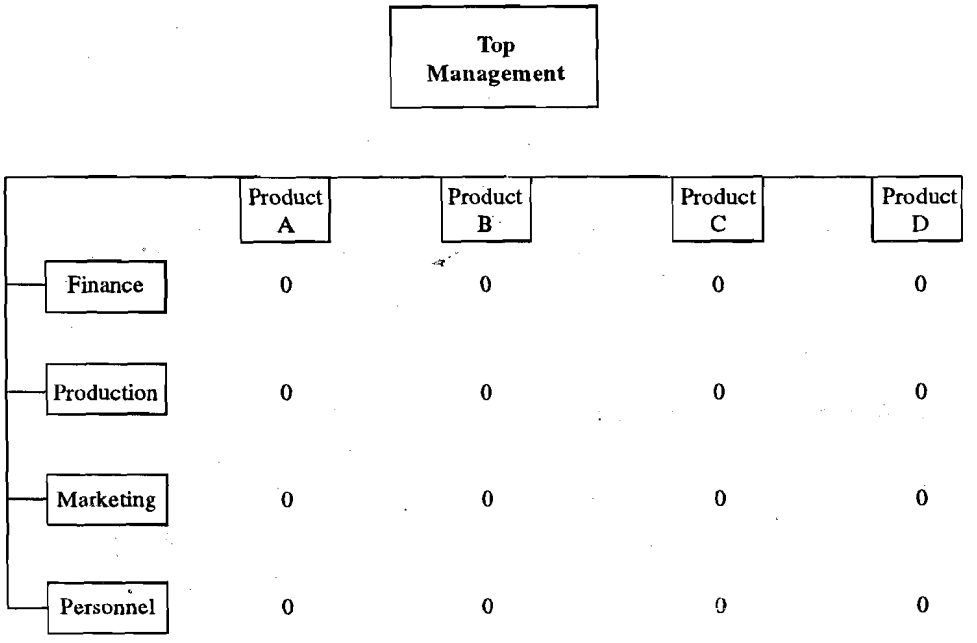

Fig. 4.6: Matrix Organisation

4.10 NETWORK STRUCTURE

When an organisation needs to control other organisations or agencies whose participation is essential to the success, a network structure is organised. In this, the main organisation creates a network of relevant agencies and it influences in different ways.

Network structure is mostly used in non-business organisations which have socio-political objectives. For instance, the State Industrial Development Corporation (SIDC) may resort to a network structure in their objective to establish an industrial estate. In this the SIDC may act as the lead agency and involve the State Electricity Board, Local Municipal Authorities, Land Development Authority, Authorities for Water & Sewage Control, P&T Department for communication facilities, appropriate authorities for building roads etc. The SIDC would also need to establish a network with people who would ultimately be using the industrial estate to know their requirements in terms of specification and special needs. It would also use the services of an advertising agency to promote the industrial estate and attract maximum number of entrepreneurs. For the construction of sheds and factories the SIDC may have to utilise the services of private construction agencies.

Thus, a network structure envisages the utilisation of a number of different services offered by different agencies. There is need to coordinate the different inputs and synchronise them towards the ultimate objective.

Activity 4

What is the basis of differentiation of tasks and activities in your organisation? On the basis of the above discussion, can you suggest three definite improvements in the organisation structure which would enhance its effectiveness?

.....

.....

4.11 INTEGRATION OF ORGANISATIONAL TASKS AND ACTIVITIES

Having designed your organisation's structure to suit the specific needs of your company and its environment on the basis of most efficient grouping, you now have to ensure that these differentiated groups are integrated towards the common organisational objectives. Generally speaking, the more differentiated and specialised are the activities, the greater the need for coordination and integration. This is because there is danger of these specialised groups getting isolated and start viewing each other as rivals rather than companions in pursuit of the same goal.

Have you ever witnessed a situation where departments belonging to the same organisation vigorously fight each other over the allocation of annual funds? Think of our country as one big organisation and the States and Union Territories as its differentiated groups. Do you think they are well integrated towards the common goal of national economic development?

The basis for integration is provided by the three elements of an organisational structure, namely authority, administration and communication network.

Integration through Authority

The hierarchical relationships in an organisation define the status of each position in relation to the others and the power that goes with that position. The basis for the hierarchical relationship is that the superior has authority over the subordinate in terms of assigning him work and the latter, in turn, is obliged to obey the superior.

Hierarchical relationships facilitate integration because they ensure that all activities are ultimately placed under one authority and thus are linked together. The top position becomes the centre for all coordination. In a small organisation, with a single product line, integration and coordination from one central position is certainly feasible. But if you consider large organisations with operations spread over many geographical areas, product lines running into hundreds and employing thousands of people, it is no longer physically possible for one person to coordinate all the tasks and activities. In such situations, the hierarchical structure has to be supported by the administrative structure and communication network.

Integration through Administration

Every organisation has its own administrative procedures and systems. These relate to almost every aspect of organisational life. The procedure for selecting new recruits, calculation and mode of overtime, travel, medical and other allowances, the system of memos and movement of a file from one department to another for decision-making are all illustrations of administrative procedures. The larger the organisation, generally, the more formally prescribed and numerous are its administrative procedures.

How administrative procedures help in integrating different departments and different levels within an organisation can easily be understood by an illustration. In a typical organisation, at the end of the corporate year, each individual, say a salesman, would fill his own assessment of his performance. The salesman's immediate boss would fill in a Confidential Report (CR) on his performance. The salesman's own assessment and the CR would both be given over to the Personnel Department which may add information from its records on the number of years the salesman has been with the company, his starting salary and designation, number of promotions and increments and bonus received, any loans outstanding against his name etc. This complete file would then go to the manager marketing, who would in consultation with the general manager decide on the salesman's next promotion and increment in accordance with the established salary structure.

Thus, the administrative procedure for deciding promotions involves sharing of information between different levels in the same department (Marketing) and between different departments (Marketing, Personnel and General Administration).

Integration through Communication

In the previous illustration, the bases for taking a decision about the salesman's promotion were his own assessment report and his boss' Confidential Report (CR). Both these are representatives of the means of communication used in an organisation. Minutes of meetings, circulars, notices, progress reports, monthly in-house newsletters are all specific tools of the communication network of an organisation.

Just as manpower, raw material and machines are the resources of an organisation, so is information. Information regarding the development of a new technology by a rival company, or the introduction of a new model of refrigerator are vital pieces of information which can drastically affect the future course of action for a company. But information is highly perishable. If not communicated to the right person at the right time it has little value.

Information may be received at one level in the organisation but utilised at another. Salesmen and other field staff are usually the eyes and ears of any organisation. They gather bits and pieces of vital information. But to be useful, these disjointed information pieces must be immediately communicated to the 'brain' of the organisation

i.e. the managers who will analyse and act upon the information. Just as market information moves upwards within the organisation, decisions have to be communicated downwards. A decision regarding change in the distribution network is made at the top, but implemented by people in the field. Therefore, there is need for communication networks which provide for transmission of information both up and down the hierarchical structure. Similarly, networks should be available for exchange of information at the horizontal level.

Computers and many other technical improvements have resulted in organisation's increased ability to collect, process, analyse and transmit vast amounts of information. Organisations today have greater access to an almost unbelievable array of information.

In the final analysis, however, it is not so much the access to sophisticated technology which an organisation has that determines the efficiency or efficacy of its communication network but rather the stance and attitude of the top management in encouraging its people to talk with each other and share more information.

Activity 5

List the various official means of communicating information in your organisation. How effective are these in integrating the various departments and different levels of management? Can you think of some more such means of communication which your organisation can adopt?

4.12 DESIGING STRUCTURE FOR A SERVICE ORGANISATION

The distinguishing characteristic of a service organisation is that it does not produce any physical or tangible product, but instead it provides a service which may in some cases be almost totally intangible. Dry-cleaning, after sales maintenance for your TV and air-conditioner, health clubs, municipal corporations, banks, universities etc. are all organisation which provide service. A health club's service can be described in terms of tangible and specific gadgets and equipment which it has. However, the behaviour of the staff towards its clients also forms an extremely important part of health club's service, but is intangible. In many cases, it is the intangible part which is more important in attracting and retaining customers.

In dealing with service organisations, therefore, you should lay emphasis on efficient service as well as friendly and courteous behaviour. In highly undifferentiated organisations such as Nationalised Banks, personalised and friendly service can become a basis for distinguishing the organisation.

The other important variable in organising service institution is to correctly identify the service which the organisation is providing to the customer and the activities need to be undertaken to maintain and improve the service.

4.13 LET US SUM UP

In this unit we have discussed various issues involved in structuring the organisation. You have a variety of designs to choose from, but no one design as it is, can prove to be a perfect fit for an organisation. You would always need to modify and adopt a structural design according to the specific objectives of your organisation, the environmental factors such as political, legal, cultural and social conditions, and your own attitude as a manager towards the issues of centralisation of power and delegation of responsibility.

Whatever be the structure you decide upon for your organisation, you must always keep in mind the basic principles of defining and describing jobs, differentiating them to form manageable parts, and then integrating them to achieve the common goals.

4.14 KEY WORDS

Centralisation : The concentration of power and authority. This may be concentrated in a person or a group of persons in the organisation.

Delegation : The sharing or handing over of authority and responsibility to a subordinate.

Differentiation : The process by which the tasks and activities of an organisation are segmented into smaller groups. The basis for differentiation may be function, product, location or customer.

Environment : The business environment of a firm comprising economic, social, political, cultural, legal and geographic factors which critically affect the working of organisation.

Functional Structure : The organisation structure wherein activities and tasks are observed into smaller groups on the basis of their belonging or contributing to a particular function such as manufacturing, marketing, finance etc.

Geographical Structure : The organisation structure in which activities and tasks are grouped together on the basis of their location in a geographical zone or territory.

Integration : The process by which differentiated groups are pulled together to contribute towards the common organisational objectives. Hierarchical control, administrative procedures and communication networks are the processes used for integration.

Line Functions : Those functions in an organisation which are perceived to be directly contributing to the organisation's objectives.

Matrix Structure : Used generally for project execution which requires the services of skilled functional people and the specialised knowledge of product specialists. Matrix structure is a combination of the functional and product structures and its distinguishing characteristic is dual authority.

Network Structure : A structure in which one organisation acts as the 'lead' organisation and creates a network of many other external organisations whose services the lead organisation utilises in fulfilment of its objectives.

Organisation Chart : The depiction of specific positions in an organisation, their states within the organisation and the reporting relationship between a subordinate and his superior.

Principle of Division of Work : That principle by which work is organised into smaller jobs allowing people to undertake only specialised activities thus ensuring efficiency in the use of labour.

Principle of Span of Control : The principle which states that there is a limit in each managerial position on the number of persons which can be effectively controlled.

Product Structure : An organisation in which activities and tasks are grouped on the basis of individual products or product lines.

Scaler Principle : The chain of direct authority relationship from superior to subordinate within the organisation.

Staff Functions : Functions which are advisory or auxiliary in nature but do not directly contribute towards the organisational objectives.

Structure : Formal and established pattern of relationship in an organisation. The relationship includes people, tasks and activities.

NOTES

UNIT 1 HUMAN RESOURCE PLANNING

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- examine the purpose and process of human resource planning;
- study the methods and techniques for projecting human resource supply and demand; and
- review the key concerns in developing a human resource strategy.

1.1 INTRODUCTION

Manpower planning is an integral part of corporate planning. 'Manpower' may be thought to be as "the total knowledge, skills, creative abilities, talents and aptitudes of an organisation's workforce, as well as the values, attitudes and benefits of an individual involved.

Manpower planning may be defined as a strategy for the acquisition, utilisation, improvement and preservation of the human resources of an enterprise. It is the activity of the management which is aimed at coordinating the requirements for and the availability of different types of employees. This involves ensuring that the firm has enough of the right kind of people at the right time and also adjusting the requirements to the available supply.

1.2 HUMAN RESOURCE PLANNING: ACTIVITIES

The major activities of manpower planning include:

Forecasting future manpower requirements either in terms of mathematical projections of trends in the economy and developments in the industry or of judgemental estimates based upon specific future plans of the company.

Inventorying present manpower resources and analysing the degree to which these resources are employed optimally.

Anticipating manpower problems by projecting present resources into the future and comparing them with the forecast of requirements to determine their adequacy, both quantitatively and qualitatively.

Planning the necessary programmes of recruitment, selection, training, development, motivation, and compensation so that future manpower requirements will be met.

Human resource planning is a double-edged weapon. If used properly, it leads to the maximum utilisation of human resources, reduces excessive labour turnover and high absenteeism: improves productivity and aids in achieving the objectives of an organisation. Faultily used, it leads to disruption in the flow of work, lower production, less job satisfaction, high cost of production and constant headaches for the management personnel. Therefore, for the success of an enterprise, human resource planning is a very important function, which can be neglected only at its own peril. It is as necessary as planning for production, marketing, or capital investment.

For an individual, it is important because it helps him to improve his skills and utilize his capabilities and potential to the utmost. For an organisation, it is important because it improves its efficiency and productivity. It is only through initial human manpower planning that capable hands are available for promotion in the future.

In simple words, Human Resource Planning is understood as the process of forecasting an organisation's future demand for, and supply of the right type of people in the right numbers. It is only after this that the HRM department can initiate a recruitment and selection process. HRP is a sub-system in the total organisational planning. Organisational planning includes managerial activities that set the company's objectives for the future and determine the appropriate means for achieving those objectives. HRP facilitates the realisation of the company's objectives by providing the right type and the right number of personnel. HRP, then, is like materials planning that estimates the type and quality of the materials and supplies needed to facilitate the manufacturing activities of the organisation. HRP is also called manpower planning, personnel planning or employment planning.

A few definitions of HRP are worth quoting here:

1) HRP "includes the estimation of how many qualified people are necessary to carry out the assigned activities, how many people will be available, and what, if anything, must be done to ensure that personnel supply equals personnel demand at the appropriate point in the future."

2) "Specifically, human resource planning is the process by which an organisation ensures that it has the right number and kinds of people, at the right place, at the right time, capable of effectively and efficiently completing those tasks that will help the organisation achieve its overall objectives. Human resource planning, then, translates the organisation's objectives and plans into the number of workers needed to meet those objectives. Without a clear-cut planning, estimation of an organisation's human resource need is reduced to mere guesswork."

The manpower plan is a part of the corporate plan. Without a corporate plan, there can be no manpower plan. If there are several imponderables and unpredictables in the corporate plan, there will be difficulties in manpower planning. Whether or not the manpower plan meets the requirements and is in tune with reality depends on clarity in goals and validity of the stated assumptions. The other important point is the time frame in defining the 'future'. In manpower planning, the future can be classified into three periods: (a) the short-range or immediate future; (b) the mid-range; and (c) the long-range future.

None of these three can be spelt out in terms of set number of days, months or years. The "immediate future" may refer to the current situation and experiences and even concern issues such as overtime and replacements. If there has been previous planning for manpower, the plans may serve as a guide in the immediate future. If not, a beginning should be made at once.

The mid-range future has a different time span in various companies. It can be as short as a few months or as long as several years. Perhaps, most would agree that 2-3 years period as a mid-range.

The long-range could be 5 years, while 10 to 15 years span could be used for a perspective plan. Long range plans must be made on the basis of various trends in the economy and in the labour market, and on long-term trends of production in the company. Long-range plans are general rather than specific, flexible rather than rigid.

Nevertheless, a plan can be extremely useful in identifying factors and trends that need to be reckoned with for early warning of possible problems. The long lead time provides the opportunity and resilience to meet exigencies and make necessary adjustments. More complete plans can be had as time slowly brings the long-range into short-range.

Activity 1

As part of this activity you are required to identify and tabulate the number of personnel at various levels and departments in your organisation. Compare your tabulation with the levels of personnel mentioned in the manpower plan of your organisation. Are there any major differences? Please find the reasons.

.....

.....

.....

.....

.....

1.3 OBJECTIVES OF HUMAN RESOURCE PLANNING

Human resource planning is deemed necessary for all organisations for one or the other of the following reasons:

i) To carry on its work, each organisation needs personnel with the necessary qualifications, skills, knowledge, work experience and aptitude for work. These are provided through effective manpower planning.

ii) Since a large number of persons have to be replaced who have grown old, or who retire, die or become incapacitated because of physical or mental ailments, there is a constant need for replacing such personnel. Otherwise, the work would suffer.

iii) Human resource planning is essential because of frequent labour turnover which is unavoidable and even beneficial because it arises from factors which are socially and economically sound such as voluntary quits, discharges, marriage, promotions; or factors such as seasonal and cyclical fluctuations in business which cause a constant ebb and flow in the work force in many organisations.

iv) In order to meet the needs of expansion programmes (which become necessary because of increase in the demand for goods and services by a growing population, a rising standard of living—which calls for larger quantities of the same goods and services as also for new goods; the competitive position of firm which brings it more business arising from improvements effected in the slump period; and the rate of growth of the organisation), human resource planning is unavoidable.

v) The nature of the present work force in relation to its changing needs also necessitates the recruitment of new labour. To meet the challenge of a new and changing technology and new techniques of production, existing employees need to be trained or new blood injected in an organisation.

vi) Manpower planning is also needed in order to identify areas of surplus personnel or areas in which there is a shortage of personnel. If there is a surplus, it can be redeployed; and if there is shortage, it may be made good.

The objective of human resource planning is to maintain and improve the organisation's ability to achieve its goal by developing strategies that will result in optimum contribution of human resources.

The objectives of manpower planning are mainly:

a) To ensure optimum use of human resources currently employed

b) To assess or forecast future skill requirements

c) To provide control measures to ensure that necessary resources are available as and when required

d) A number of specific **reasons** for attaching importance to manpower planning and forecasting exercise are to:

- link manpower planning with organisational planning
- determine recruitment levels
- anticipate redundancies
- determine optimum training levels
- provide a basis for management development programmes
- cost the manpower in new projects
- assist productivitiy bargaining
- assess future accommodation requirements
- study the cost of overheads and value of service functions
- decide whether certain activities need to be subcontracted, etc.

1.4 HUMAN RESOURCE PLANNING PROCESS

The manpower plan influences the corporate strategy and is in turn influenced by it. The manpower planning process may incorporate all the stages shown in Fig.1.1. The planning process may not always give exact forecasts. To be effective it should be a **continuous** process with provision for control and review.

The first step in the manpower planning process is the establishment of a planning horizon. One should know the period for which the manpower plan will apply. Then, the specific corporate objectives and strategies should be clear. Based on these, estimates or projections for demand and supply manpower can be made using the approach and methods suggested in the next unit. The difference between the estimates of demand for and supply of manpower is often referred to as the 'manpower gap' and one of the main components of the manpower strategy is to formulate plans for closing it—perhaps by recruitment and training (if the demand is positive, i.e., demand exceeds supply) or by planned redundancy (if the gap is negative).

1.5 PROJECTING MANPOWER SUPPLY AND DEMAND AT ORGANISATIONAL LEVEL

The paradox in manpower projections is that while the techniques are easy and simple, applying them successfully is enormously complex and difficult. Manpower projections are not an academic exercise or an end unto themselves. Their value lies in extending the range of other phases of manpower planning and, indeed of planning for other company functions.

Forecasts of manpower supplies and demands are of two types, estimates and projections. Estimates are educated guesses based on experience while projections are mathematical extensions of data on manpower into the future. Most forecasts involve both projections and estimates.

Forecasting Techniques

We shall now attempt to look at the aspect of forecasting future requirements. This can be done through various techniques.

The process of estimating manpower demand consists of four steps:

- an approach
- a basic factor
- a method
- a technique

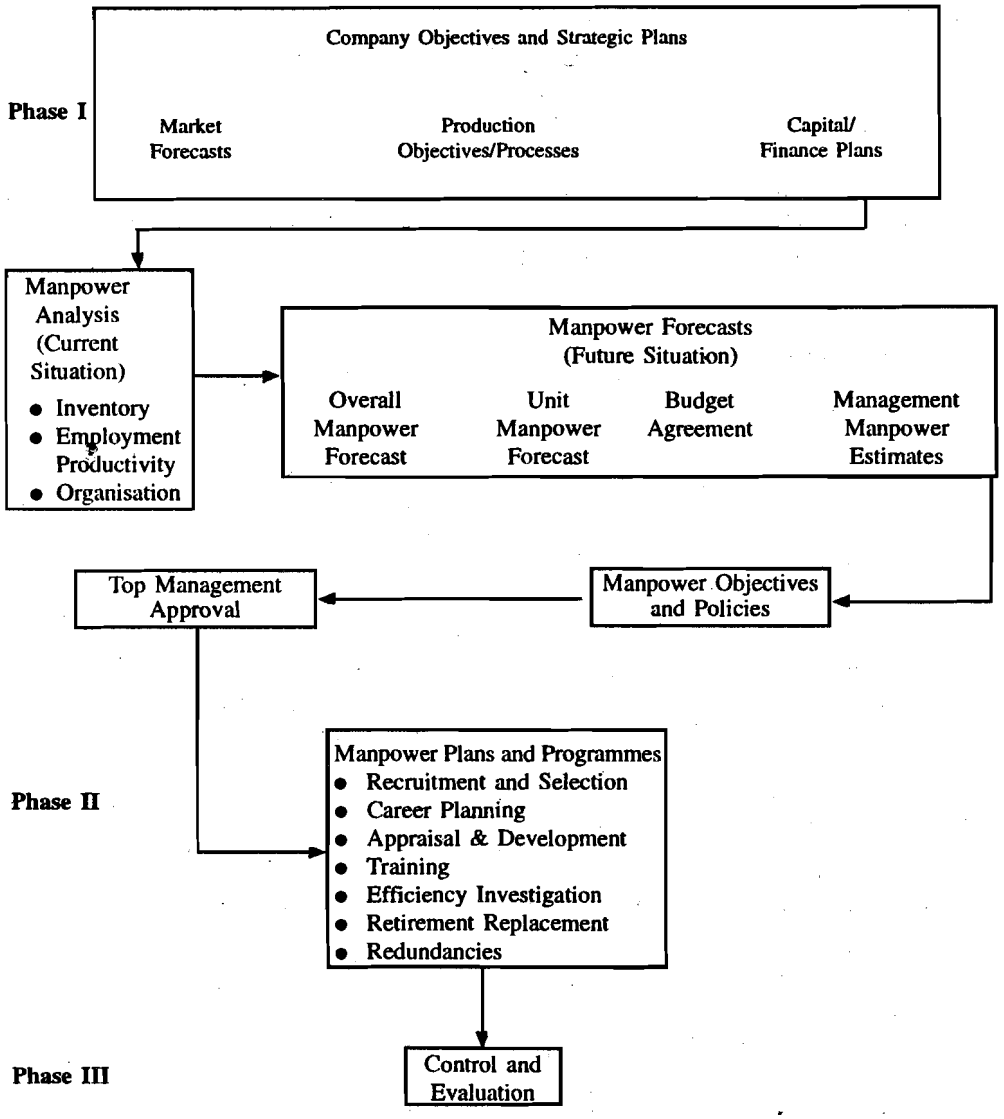

Fig. 1.1: The Manpower Planning Process

Approach

There are eight possible approaches:

1) Subjective
2) Objective
3) Global
4) Component
5) Techno-economic
6) Non-economic
7) Deterministic
8) Probabilistic

The order in which they are mentioned suggests the formation of four groups, each of which comprises two mutually exclusive approaches e.g. (i) Subective or Objective, (ii) Global or Component etc.

The groups, between themselves, are not quite mutually exclusive.

A subjective approach to manpower demand estimation uses intuition, impression or judgement. Opposed to this, the objective approach tries to justify the estimate of demand on the basis of certain factors or logical explanations.

A global approach would try to estimate manpower demand as an overall figure, directly for the entire problem under consideration, whereas a component approach would first estimate the demand for segments of the problem and then aggregate it.

The techno-economic approach combines the technological, economic and organisational considerations mentioned earlier, whereas the non-economic approach utilises only socio-political and other considerations.

Basic Factor

A basic factor means a variable to which manpower demand can be related. The choice depends upon the number of considerations which together constitute the multi-dimensional framework of the particular problem facing us.

Methods

According to Gareth Steiner, statements about the future can be made in two senses:

What will occur?

What should occur?

According to Steiner, what is more significant than the time element is the way in which the change in one phenomenon i.e. manpower, is associated with change in another (basic factor, which was mentioned earlier).

The rate at which the change takes place exerts an influence on the frequency of measurement and forecasting required and affects the need for different kinds of feedback. In practice, what managers see as desirable will be influenced by past experiences. All these assessments involve making assumptions about managerial capacity, manpower utilisation or the rate of change in manpower.

According to Steiner, the major advantages of manpower forecating are:

a) It corresponds to the way managers commonly think and talk about manpower.

b) It encourages the recognition that, even where output is not readily measurable, we can still make good forecasts of manpower, provided we can quantify work done in some way.

c) It highlights the way in which we have to control the effect by other inputs such as capital on manpower requirements.

Techniques

In this context therefore, one can outline a few specific techniques of manpower demand forecasting.

Subjective

The forecast here is made on the basis of estimates by experienced people whose experience has taught them what types of changes are important and the rates of change involved. Implicitly however, subjective techniques involve subjective estimation of workload and manpower utilisation and their rate of change.

The advantage lies in that the data collection is required and intangible factors like social opinion, fashion, etc. can be built in. However, the disadvantage lies in the errors of the human mind which can be perpetuated while carrying out the exercise of demand of estimation for manpower. Forecasts based entirely on subjective assessment are unlikely to give very good results. However, supplementing objective techniques with subjective estiamtes can be useful e.g. through using subjective probabilities.

Time Series Analysis

The time series extrapolation is a good method where it is sometimes not possible to take an overall view of a group of staff, to base a forecast on estimates for workload and manpower utilisation.

There are four elements of the time series method:

Trend (T_1)

Cyclicat effect (C_1)

Seasonal effect (S_t)

Random effect (R_t)

These veing multiplicative, we can get:

$V_t = T_t \times C_t \times S_t \times R_t$

Projections or extrapolations can be done on the basis of moving averages or exponential smoothing.

Work Study Method

The work study technique uses time and motion studies to analyse the work being done. This method is useful for repetitive jobs which have a high degree of manual content and where job methods do not change frequently.

Accuracy of Techniques

No method of forecasting can be entirely without error. Some changes are unique (such as new legislation or a decision to close down an establishment) and hence are more or less unpredictable as to timing. Such errors as are due to these unique changes are unavoidable. There are also errors that are partly avoidable since they stem from inaccurate information or inappropriate techniques. Even where errors are theoretically avoidable, it unrealistic to expect more than a proportion of error to be actually avoidable.

However, a forecast, or any resulting objective, must be modified as soon as it seems that it no longer represents the most likely occurrence. Unfortunately, the poeple become emotionally attached to forecasts. We must remember, however, that errors have a cumulative effect over time.

Taking the above factors into consideration, a corporate approach to manpower planning is to be developed. In doing so certain **key considerations** such as the following emerge:

a) What positions and individuals are to be included in the planning effort? A simple rule of thumb is to include all positions which are critical to corporate performance and profits and/or pose recruitment poroblems.

b) What is the appropriate manpower planning horizon? Experience shows that it can extend up to 4 to 5 years. Beyond 5 years, technical manpower forecasts have doubtful value due to pervasive imponderables and unpredictables in the environment. Within the planning period, there should be a formal method of review and assessment at least once every year.

c) With what business factors will manpower needs be related? For a company producing fertiliser, it could be tons of fertiliser, for an automobile unit, it could be the number of cars and trucks. For a retailer, it could be the rupee value fo sales. To be useful, the predictor should meet at least two requirements: (a) it should be directly related to the essential nature of the business; and (b) changes in the selected factor be proportional to changes in the manpower required.

Selecting a Proper Predictor

For instance, while relating manpower needs with rupee value of turnover, appropriate indexation for inflation is called for. Multi-product firms need to evolve appropriate conversion factors to have a common base. Alternatively, they can have separate forecasts for each of the products, particularly if the products differ not only in terms of numbers required, but also in the types of skills needed. Some firms find it necessary to select several factors, one for each of different segments of the work force. In a refinery, for instance, production workers may be related to one factor, the sales force to another, management to a third, and the professional work force to still a fourth.

Firms which build up complete sets of historical records on various related aspects can make quite accurate projections against those which lack adequate data base. Now firms rely on the existing norms in the industry and make adjustment for the unique features of the firms vis-a-vis the other firms in the industry on such aspects as technologies, management culture, compensation, etc.

Simple arithmetical projections based on historical data may lead to disastrous consequences. While using historical data for projections due regard should be given to change in plans and programmes, technology, environment, etc. The staff specialists in manpower planning would do well to seek the assistance of experienced operating managers to interpret reasons for past changes or anticipating future changes.

Projections for Particular Groups of Employees

As already mentioned, total manpower needs of an organisation can be built up from projections made for specific segments of their work force. Different work groups relate differently to various predictors and thus have different productivity ratios. In each case the following process is followed: find the appropriate business factor, draw up the historical record of that factor in relation to manpower employed, compute the productivity ratios, determine the trend, make the necessary adjustments in the trend, past and future, and project to the target year.

Organisations may adopt a functional framework by viewing positions according to functional activities than by grouping them into separate organisational units. The purpose of grouping positions similar in content, regardless of their location in the organisational structure is to recognise that each of these different groups of jobs require different knowledge, skills and characteristics and are involved in different career ladders. Such knowledge about different groups in itself is useful. Experience shows that in any organisation 6 to 12 job or skill groups would meet the major activities in all functional areas.

Some firms develop the total projection for the work force at the operating level and work out the projections at various responsibility levels in each job/skill group by means of ratios. Firms may discover a stable relationship between the total number of workmen and foremen. Depending upon the number of levels in hierarchy—it usually varies from 5 to 15—and assumptions about span of control, nature of work, technology and historical data, projections are made.

Projecting Labour Costs

Manpower projections emphasise the number of employees. But firms are interested in the labour costs also. The share of labour costs to total costs range from about two per cent in process industries to around 60 per cent in the nationalised coal industry. The labour costs can be projected by examining the trends in labour productivity, proposed change in work technology, union wage agreements, inflation, government rules, etc. Some companies have been able to maintain the labour cost component in total cost static over a period of say, five years, even though in the intervening period the average emoluments of the employees have gone up by one-third. Companies like ITC Ltd. and Premier Automobiles Ltd. could do this through productivity bargaining as part of wage negotiations whereby workers will not only get more than what they were earning before, but also turn out higher levels of performance. In such companies, it becomes possible to produce more output than before with the existing manpower.

Projecting the Source of Supply

Projecting the number, type and level of employees tells only half the story in manpower planning. Every organisation will have two major sources of supply: internal and external. In unionised firms, up to a level, agreements determine the ratio of external and internal sources of supply.

Internal Sources: Proper manpower planning and information system enables the organisation to know the profile of the employees—age, sex, education, training experience, job level, performance, and potential.

Manpower requirements arise out of growth or diversification or because of the movement of the employees on account of transfer, promotion, job rotation, voluntary retirement, resignation, retirement, dismissal discharge or death. In either case, as and when vacancies arise, organisation can match the skill and level requirements with the profile of the employees and meet the requirements. While some of the internal changes and external supply could be predicted such as growth opportunities, transfer and promotions, retirements, etc., others are not easy to predict. But, as elsewhere, past

experience and historical data may be of some help. The companies which have systematised personnel records and information systems and which have well established career and succession plans find it easier to project internal sources of supply relatively accurately.

External Sources: When the company grows rapidly, diversifies into newer areas of operations or when it is not able to find the people internally to fill the vacancies, it has to resort to outside recruitment. To the extent a firm is able to anticipate its outside recruitment needs and scans the possible sources of supply with a feel for the labour market conditions, its problems in recruiting the right number with right skills in the right time would become easier.

If both supply and demand projections are made in time or if there are any problems such as shortage of skills, appropriate steps can be taken to overcome them. For example, several companies started apprentice training programmes when they predicted a shortage for certain types of skills. When major manufacturing projects are planned to be located in hitherto backward areas, such problems are felt more acurately. For instance, there is the case of paper mill in the eastern region not being able to reach even 10 per cent capacity utilisation, several years after it was commissioned, because of shortage of people with appropriate skills to run the paper mill.

Accuracy of Projections

The accuracy of the projections is based on the following factors:

a) The predictability of the industry, i.e., whether the business conditions are generally stable or not.

b) The degree of integration on manpower planning with other company planning efforts, and the amount of experience that the company has with all types of planning. If a company plans very far into the future, it may be sacrificing accuracy and flexibility.

c) Historical data about manpower levels and about the selected business factors with which manpower projections are related. Even the experience of operating managers is not useful in making projects and estimates in the absence of good manpower records. The projections, at best, can be as good as the data base.

d) The knowledge, experience and outlook of the operating managers. When manpower projections are made as part of the total planning process, even when the forecasts are not accurate, they atleast succeed in providing warning of possible problems.

e) The framework for manpower utilisation for the forecast period.

Activity 2

Visit a hospital, you have known or access to and do the following:

a) Assess and identify the objectives of manpower planning in the hospital.

b) Identify the critical areas and the extent of manpower shortages and the reasons for such shortages.

c) Identify manpower surpluses and reasons thereof.

d) Identify and fix forward targets for manpower development.

e) Identify the major manpower problems and their causes and interrelationship.

1.6 DEVELOPING MANPOWER STRATEGY: KEY CONCERNS

In this section certain key concerns in developing manpower strategies are briefly considered.

Approach

While assessing future requirements, the estimates depend mostly upon the nature of manpower assumptions in the organisation. Corporate strategy can influence manpower strategy and vice-versa. Here we may consider three approaches: the zero budgeting approach, the ideal, and the realistic.

Zero budgeting, as the name implies, is an approach in which one forces unit/division managers to justify their total operation from zero. The objective is to encourage managers to seriously think about their current activities. Given the restrictions posed by law and unions, the practicability of this approach for ongoing organisations in manpower planning is doubtful.

It is only new units that can start thinking about manpower planning in terms of what might constitute an 'ideal' approach. Any decisions on sub-contracting, off-loading some functions like maintenance production-technology, etc., may depend on the perceived notions of what constitutes an ideal for the organisation.

Organisations can proceed on a realistic approach using existing information. A company which operates on a three-year planning cycle may record manpower levels in subunits or division in such a way that it is easy to monitor and hold managers responsible (see Fig. 1.2). Organisations which choose to supplement manpower plans with different business parameters and manpower ratios. (e.g. gross value added per employee, capital employed per employee) have to be varied about the fact that the future may not follow the past and ajustments may have to be made for variations.

Item	Current year	Forecast	Forecast
	Year 1	Year 2	
Stock as on January			
Manpower increases			
• Business Activity			
• Capital Expenditure			
• Takeover/merger			
Manpower decreases			
• Business activity			
• Capital expenditure			
• Disinvestment			
• Productivity improvement			

Fig. 1.2: Monitoring Manpower Levels

Personnel Policies Affecting Manpower Supply

Manpower supply in undertaking is affected by the personnel policies ranging from recruitment to retirement. As shown in Fig. 1.3, manpower flows in and out of an organisation due to a variety of reasons. Policies affecting each of these aspects need to be reviewed regularly to assess their possible effects on manpower supplies to meet the gap between supply and demand.

Strategic Decisions Affecting Manpower Demand

Organisations operate in a changing environment. Therefore, they do not remain static. Manpower structures also do not remain static. Questions on the activities and roles of persons at different levels and studies on organisation and methods of work may provide useful insights and opportunities to revise manpower structures that change the estimates about manpower required.

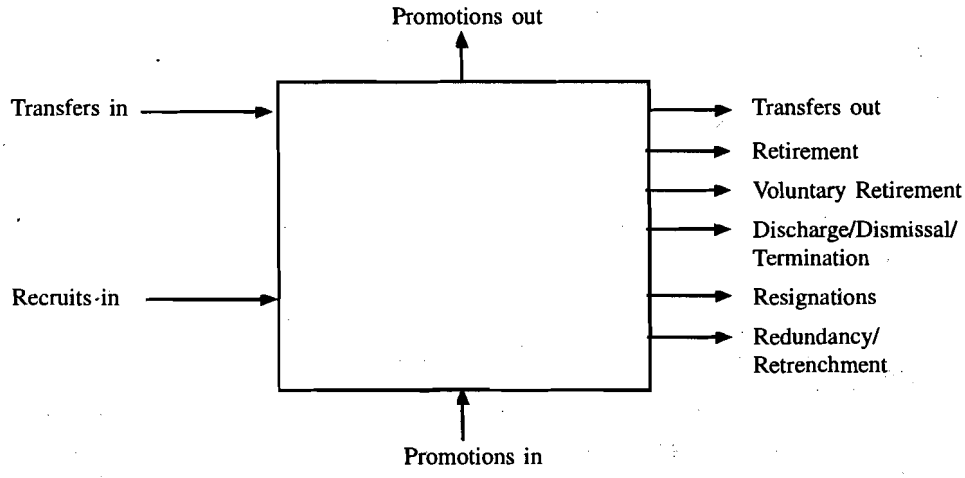

Fig. 1.3: Forces of Manpower Flow in an Organisation

Change in production methods, union agreements on productivity, off-loading maintenance, sub-contracting, etc. are some of the strategic decisions that help organisations to significantly alter their manpower needs without affecting the volume of business.

Personnel Information Systems

Most organisations do not have adequate information on manpower. Several of those do not have proper retrieval systems. There are understandable difficulties in resolving the issues and complexities in design, definition and creation in computerised personnel information systems for effective manpower planning and utilisation. Even the current technologies and knowledge in this respect is not put to use optimally. This is strategic disadvantage.

Activity 3

Managing a large/medium size hospital with special setting of the environmental factors of developing countries and the great demands placed on the hospitals by the public, make it essential for the hospitals to take whatever measures possible to see that its effectiveness is demonstrated to the greatest possible extent. This involves careful planning of various activities of the hospital.

Based on the contents discussed in this unit do the survey of hospital to understand manpower planning and prepare brief notes broadly on the lines given below:

1) Hospital manpower situation report on existing manpower and services.
2) Manpower requirements, availability and distribution at various levels.
3) Future supply of manpower from training schools and institutions
4) Mismatches between supply and requirement
5) Solving mismatches
6) Organisational and managerial problems
7) Manpower strategy and outline plan
8) Detailed plan
9) Implementation of the plan.
10) Monitoring

1.7 LET US SUM UP

Manpower planning affects organisation strategies and vice-versa. We have reviewed the concept of manpower planning and studied the objectives and reasons for current interest in the subject. There are three stages in manpower planning process. We examined the techniques and special problems of manpower supply and demand at organisational level. Finally, we have considered certain key concerns in developing manpower strategies.

1.8 SELF-ASSESSMENT TEST

1) What is the purpose of manpower planning? Explain the process.

2) Examine the reasons for the current interest in manpower planning.

3) Briefly review the forecasting techniques.

UNIT 2 RECRUITMENT, SELECTION AND INDUCTION

Structure

2.0 OBJECTIVES

After going through this unit, you should be able to:

- spell out the importance of job specifications in the selection process;
- explain various processes of recruitment;
- explain the importance and need of each of the stages of recruitment and selection processes;
- comprehend the need for various psychological tests in the process;
- evaluate the purpose of induction and the processes involved therein; and
- identify the care and caution warranted in the whole process.

2.1 INTRODUCTION

People in the organisation who are not selected on merit but on other considerations would be misfit and create all sorts of problems for the organisation and the other employees. Recruitment forms the first stage in the process which continues with selection and ceases with the placement of the candidate. Recruitment is the next step in the procurement function, the first being the manpower planning. Recruitment makes it possible to acquire the number and types of people required for the organisation. Recruiting involves discovering potential applicants for actual or anticipated organisational vacancies.

As Yoder and others point out, "Recruitment is a process to discover the sources of manpower to meet the requirements of the staffing schedule and to employ efffective measures for attracting that manpower in adequate numbers to facilitate effective selection of an efficient working force." Accordingly, the purpose of recruitment is to locate sources of manpower to meet job requirements and job specifications.

2.2 DEFINITIONS

Recruitment

Recruitment is the process of identifying the prospective employees, stimulating and encouraging them to apply for a particular job or jobs in an organisation. It is a positive action as it involves inviting people to apply. The purpose is to have an inventory of eligible persons from amongst whom proper selection of the most suitable person can be made.

Selection

Selection is the process of examining the applicants with regard to their suitability for the given job or jobs, and choosing the best from the suitable candidates and rejecting the others. Thus, you will notice that this process is negative in nature in the sense that rejection of candidates is involved.

Placement

Placement is the determination of the job for which a selected candidate is best suited and assigning that job to him. The ideal situation is 'the right man for the right job'. A proper placement of a worker reduces employee turnover, absenteeism, accident rates, etc., and improves morale, motivation, work etc.

Induction

Induction is introducing an employee to the job and to the organisation. The primary purpose of induction is to 'sell' the company to the new employee so that he may feel proud of his association with the company. This is called 'orientation' or 'indoctrination'.

Their Inter-relationship

The above are the four steps taken in the order given before a person starts his training for the job to which he/she is assigned. First he is recruited, that is, his attention is drawn to the existence of a possible opening for him and he is invited to apply for it. In the next stage of selection all the applicants are screened to find their suitability for the job and the best one is selected. The third step of placement follows selection and a particular job is assigned to the selected person. After that he is introduced to his job and to his organisation so that he may understand the environment in which he has to work.

Job Analysis

It is the process of studying and collecting information relating to the operations and responsibilities of the specific job. Job analysis is based on job description, job specification and job classification.

Job Description

A description will contain:

- The job title
- A job summary which gives a short definition or picture of the job
- Comprehensive and concise list of duties to be performed
- Supervision received and given
- Working conditions
- Relating to other jobs
- Qualities required i.e. education, technical knowledge, experience if any, degree of responsibility etc.

Job Specification

Job specification is a "statement of the minimum acceptable human qualities necessary

to perform a job properly." Job specification tells what education is required or what special machines or equipment shall be needed for the purpose.

Job Classification

It is the grouping of positions having a sufficient number of common characteristics to enable them to be grouped into a unit, e.g. laboratory aid, nursing aid, pharmacy aid, clerical group etc. The job classification helps in evolving different job grades and fitting them into the main organisational structure.

2.3 RECRUITMENT AND SELECTION

Recruitment has been regarded as the most important function of personnel administration, because unless the right type of people are hired, even the best plans, organisation charts and control systems would not do much good. Flippo views recruitment both as 'positive' and 'negative' activity. He says: "It is a process of searching for prospective employees and stimulating and encouraging them to apply for jobs in an organisation. It is often termed positive in that it stimulates people to apply for jobs to increase the 'hiring ratios', i.e. the number of applicants for a job. Selection, on the other hand tends to be negative because it rejects a good number of those who apply, leaving only the best to be hired."

Recruitment policy should take into account that high calibre personnel are essential to have but hard to find. Recruitment and selection are not synonymous. Recruitment means announcing job opportunities to the public in such a way that maximum number of suitable people may come across. Selection means choosing from that number, those applicants who are most likely to succeed in the jobs. An interview is the most widely used technique for selection.

Selection is a process of weeding out the unsuitable candidates and finally arriving at the most suitable one. In this sense, recruitment is a positive process while selection is a negative process of rejecting most of the candidates, leaving only a few who are considered suitable.

In India the organisational practices in selection vary widely. The private and public sector organisations differ in their selection practices. Selection for public sector undertakings is done through Public Service Commission, Banking Service Commission, Subordinate Services Commission etc.

Despite tremendous unemployment, it is not easy to find the right type of personnel. In the expanding industrial economy of India, the demand for top management, technical and scientific personnel is expanding at a fast rate with the result that an all-round shortage of such personnel is being felt. Many organisations indulge in attracting executives from similar organisations on higher salaries. But this does not, in any way, expand the supply of such personnel. Therefore, a sound recruitment policy has to be based on a comprehensive programme of management development.

Recruitment needs can be classified into three broad categories—planned, anticipated and unexpected. The planned needs arise out of changes in organisational decisions and superannuation policies, unexpected needs arise from individuals' decisions to leave organisation and from accidents or deaths. The anticipated category comprises those jobs which the organisation, by studying the trends within and outside the organisation can predict.

In India careful recruitment of employees is particularly important for basically two reasons: first, under the existing legal conditions, when an industrial worker is discharged, an industrial dispute can be made by the employee in regard to such discharge and the Tribunal would determine whether the termination of service was justified and to order reinstatement if the order was not appropriate. Secondly, the chances of mismatching the job and the person are much higher in India. Matching the job with the suitable applicant is naturally a two-way process i.e. the employee's choice and suitability matching with employer's requirements.

2.4 THE RECRUITMENT PROCESS

The Recruitment Process

There are two dimensions of the recruitment process. One is that in all cases recruitment involves locating and attracting adequate human resources to fill existing vacancies and the other is that recruitment is a critical management activity. The right people are the future of the organisation. No organisation can survive in the absence of human resources.

Vacancies in an organisation occur through someone leaving or as a result of expansion. Recruiting a new employee though may be the most obvious step when a vacancy occurs but some other options may also be appropriate depending on the situational needs. Jobs may be rearranged so that the total amount of work in a section is done by the remaining employees. Extra output can be achieved by using overtime. The work of the employee can be mechanised, though it is not easily feasible to mechanise a single vacancy—replacing full-time jobs with part-time jobs. Sub-contract the work and using another strategy is to use an agency is to provide temporary personnel, who is not a permanent liability to the organisation.

Preparation for Recruitment

Before you think of inviting people to apply for a job you have to decide what types of persons are to be invited and what their characteristics should be. This calls for fixing the 'job specifications' which may also be called 'man specifications'.

Job specifications are based on job description which is dependent upon the nature and requirements of a job. Thus, job specification will be different for each job.

We shall explain below the various elements of job specification:

Physical Specifications: For certain jobs, some special physical features may be required. For example, for assembly of a TV set or some other electronic equipment good vision is required, for a typing job you need finger dexterity, for a heavy job you need a strong, heavy and thick-set body. The particular physical abilities and skills necessary for a given job have to be specified. These may refer to height, weight, vision, finger dexterity, voice, poise, hand and foot coordination, motor coordination, colour discrimination, age-range, etc.

Mental Specifications: These include intelligence, memory, judgement, ability to plan, ability to estimate, to read, to write, to think and concentrate, scientific faculties, arithmetical abilities, etc. Different jobs require different degrees of such abilities and the more important ones should be specified.

Emotional and Social Specifications: These include characteristics which will affect his working with others, like personal appearance, manners, emotional stability, aggressiveness or submissiveness, extroversion or introversion, leadership cooperativeness, initiative and drive, skill in dealing with others, social adaptability, etc.

Behavioural Specifications: Certain management personnel at higher levels of management are expected to behave in a particular manner. These are not formally listed but have to be kept in mind during the process of recruitment, selection and placement.

Activity 1

Please describe below your job as carefully and precisely as you can.

.....

.....

.....

.....

.....

.....

.....

.....

Please give below the ten most important elements of your job specification. Also evaluate yourself in respect of each element and write against it whether you meet it (a) fully, (b) substantially, (c) to some extent, or (d) not at all.

Element	Extent of meeting (a), (b), (c), (d)

Sources of Manpower

There are two categories of sources of supply of manpower—Internal and External.

Internal Sources: These include personnel already on the pay-roll of the organisation as also those who were once on the pay-roll of the company but who plan to return, or whom the company would like to rehire. These include those would quit voluntarily or those on production lay-offs.

External Sources: These sources lie outside the organisation, like the new entrant to the labour force without experience. These include college students, the unemployed with a wider range of skills and abilities, the retired experienced persons, and others not in the labour force, like married women.

A policy of preferring people from within is advantageous as it improves the morale of the employees and promotes loyalty among them towards the organisation. This also helps employers as they are in a better position to evaluate those already with them and as these people require no induction.

The policy of preferring internal candidates, however, suffers from some disadvantages. It may lead to inbreeding, discouraging new blood from entering an organisation. If promotion is based on seniority, the real capable hands may be left out.

Likewise, there are good and bad points about external sources. These sources provide a wide market and the best selection considering skill, training and education. It also helps to bring new ideas into the organisation. Moreover, this source never 'dries up'. In respect of people selected under this system, however, one has to take chances with the selected persons regarding their loyalty and desire to continue. The organisation has to make larger investments in their training and induction.

You will realise now that dependence on just one of the sources is not in the interest of an organisation. It must depend on both in a ratio to be fixed considering various factors.

Some of these factors are described below:

1) **Effect of the policy on the attitude and actions of all employees**

Employees no doubt, feel more secure and identify their own long-term interest with that of the organisation when they can anticipate first charge at job opportunities. The general application of the 'promotion from within' policy may encourage mediocre performance. The point to be considered here by the organisation is, how important is the loyalty of the employees to it, balancing the risk of mediocre performance.

2) **The level of specialisation required of employees**

The principal source in many organisations may be the ranks of the present employees who have received specialised training.

3) **The degree of emphasis on participation by employees at all levels**

New employees from outside, with no experience in the firm, may not know enough about its service or product or processes to participate effectively, for some time at least.

4) **The need for and availability of originality and initiative within the organisation**

If the organisation feels that it is training its people for these qualities it may prefer its own people; if not, new people with different ideas may be taken from outside.

5) **Acceptance of seniority principle**

The policy or promotion from within will succeed only if management and employees accept the seniority principle with or without suitable modifications for promotion. If it is not accepted, selection may better be done on an open basis.

Methods of Recruitment

All methods of recruitment can be put into three categories: (a) Direct Methods, (b) Indirect Methods, and (c) Third-Party Methods.

a) **Direct Methods:** Direct methods include sending recruiters to educational and professional institutions, employee contacts with public, manned exhibits and waiting lists.

Schools and Colleges: For clerical, labour and apprenticeship help, high schools can be extensively used. For technical, managerial and professional jobs, colleges, university departments and specialised institutes, like the IITs and IIMs, are used. These institutions usually have a placement officer or a teacher-in-charge of placement, who normally provides help in attracting employers arranging interviews, furnishing space and other facilities and providing student resumes. The companies maintain a list of such institutions, keep in touch with them, send their brochures indicating job openings, future prospects, etc. On the basis of these students who want to be considered for the given job(s) are referred to the company recruiter.

Employees' Contact with the Public: The employees of the organisation are told about the existence of particular vacancies and they bring this to the notice of their relatives, friends and acquaintances.

Manned Exhibits: The organisations send recruiters to conventions and seminars, setting up exhibits at fairs, and using mobile offices to go to the desired centres.

Waiting Lists: Many firms lean heavily on their own application files. These record list individuals who have indicated their interest in jobs, either after visiting the organisation's employment office or making enquiries by mail or phone. Such records prove a very useful source if they are kept up-to-date.

b) **Indirect Methods:** Indirect methods cover advertising in newspapers, on the radio, in trade and professional journals, technical journals and brochures.

When qualified and experienced persons are not available through other sources, advertising in newspapers and professional and technical journals is made. Whereas all types of advertisements can be made in newspapers and magazines, only particular types of posts should be advertised in the professional and technical journals, e.g. only engineering jobs should be inserted in journals of engineering.

A well thought-out and planned advertisement for an appointment reduces the possibility of unqualified people applying. If the advertisement is clear and to the point, candidates can assess their abilities and suitability for the position and only those who possess the requisite qualifications will apply.

c) **Third-Party Methods:** Various agencies are used for recruitment under these

methods. These include commercial and private employment agencies, state agencies, placement offices of schools, colleges and professional associations, recruiting firms, management consulting firms, indoctrination seminars for college professors, friends and relatives.

Private Employment Agencies: These agencies specialise in specific occupation like general office help, salesmen, technical workers, accountants, computer staff, engineers and executives, etc. These agencies bring together the employers and suitable persons available for a job. Because of their specialisation, they can interpret the needs of their clients and seek out particular types of persons.

State or Public Employment Agencies: These agencies also known as Employment or Labour Exchanges, are the main agencies for public employment. They also provide a wide range of services, like counselling, assistance in getting jobs, information about the labour market, labour and wage rates, etc.

Executive Search Agencies: These agencies maintain complete information records about employed executives and recommend persons of high calibre for managerial, marketing and production engineers' posts. These agencies are looked upon as 'head hunters', 'raiders', and 'pirates'.

Indoctrination Seminars for College Professors: These are arranged to discuss the problems of companies to which professors are invited. Visits and banquets are arranged so that professors may be favourably impressed and later speak well of the company and help in getting required personnel.

Friends and Relatives of Present Employees: These constitute a good source from which employees may be drawn. This, however, is likely to encourage nepotism, i.e. persons of one's own community or caste may only be employed. This may create problems for the organisation.

Trade Unions: Trade Unions are often called on by the employers to supply whatever additional employees may be needed. Unions may be asked for recommendations largely as a matter of courtesy and an evidence of goodwill and cooperation.

Professional Societies: Professional Societies may provide leads and clues in providing promising candidates for engineering, technical and management positions. Some of these maintain mail order placement services.

Temporary Help Agencies: Employ their own labour force, both full-time and part-time and make them available to their client organisations for temporary needs.

Casual Labour Source is one which presents itself daily at the factory gate or employment office. Most industrial units rely to some extent on this source. This source, you will realise, is the most uncertain of all sources.

Deputation: Persons possessing certain abilities useful to another organisation are sometimes deputed for a specified duration. Ready expertise is available but, you can guess, such employees do not easily become part of the organisation.

Activity 2

a) Recall your first appointment to the present organisation and write below which of the above mentioned sources of recruitment was used by the organisation.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

b) Think of the various sources tapped by your organisation in getting employees for your Section/Department and write below in order of importance the first five.

RECRUITMENT
THE EMERGING CHALLENGES

- Attract people with multi-dimensional experiences and skills
- Induct outsiders with a new perspective to lead the company
- Infuse fresh blood at every level of the organisation
- Develop a culture that attracts people to the company
- Locate people whose personalities fit the company's values
- Devise methodologies for assessing psychological traits
- Seek out unconventional development grounds of talent
- Search for talent globally, and not just within the country
- Design entry pay that competes on quality, and not quantum
- Anticipate and find people for positions that do not exist yet

Source: *Business Today*, January 7-21, p. 55, 1996.

2.5 SELECTION

Selection, as you have seen earlier, is the process of securing relevant information about an applicant to evaluate his qualifications, experience and other qualities with a view to matching these with the requirements of a job. It is essentially a process (picking out the man or men best suited for the organisation's requirements).

The Selection Process, you would recall that selection process involves rejection of unsuitable or less suitable applicants. This may be done at any of the successive hurdles which an applicant must cross. These hurdles act as screens designed to eliminate an unqualified applicant at any point in the process. This technique is known as the 'successive hurdles technique'. Fig. 2.1 gives these hurdles.

Yoder calls these hurdles 'go, no-go' gauges. Those who qualify a hurdle go to the next one, those who do not qualify are dropped out. Not all selection processes, however, include these hurdles. The complexity of the process usually increases the level and responsibility of the position to be filled. Moreover, these hurdles need not necessarily be placed in the same order. Their arrangement may differ from organisation to organisation.

Initial Screening or Preliminary Interview

This is a sorting process in which prospective applicants are given the necessary information about the nature of the job and also, necessary information is elicited from the candidates about their education, experience, skill, salary expected, etc. If the candidate is found to be suitable, he is selected for further process and, if not, he is eliminated: This is a crude screening and can be done across the counter in the

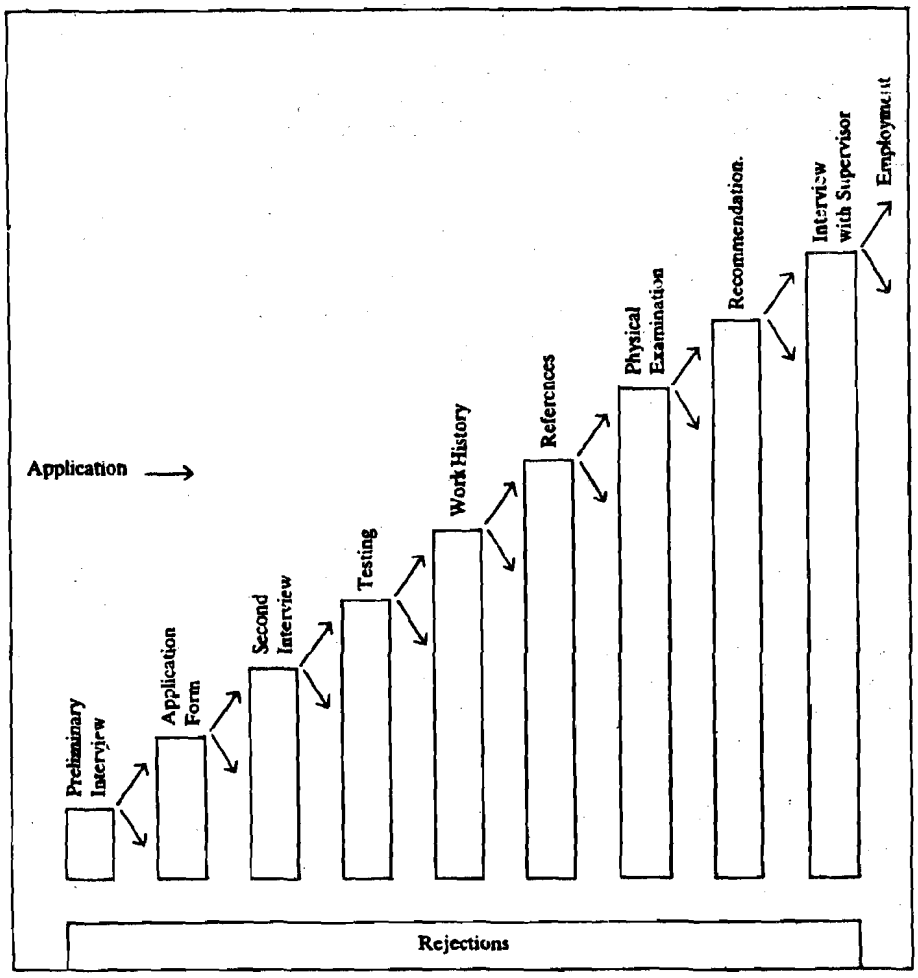

Fig. 2.1: Successive Hurdles in the Selection Process

organisation's employment offices. This is done by a junior executive in the personnel department. Due care should be taken so that suitable candidates are not turned down in a hurry. Since this provides personal contact for an individual with the company, the interviewer should be courteous, kind, receptive and informal.

When a candidate is found suitable, an application form is given to him to fill in and submit.

Application Scrutiny

You might have seen that sometimes applications are asked on a plain sheet. This is done where no application forms are designed. The applicant is asked to give details about age, marital status, educational qualifications, work experience and references. Different types of application forms may be used by the same organisation for different types of employees, e.g., one for managers, the other for supervisors and a third for other employees. Some forms are simple, general and easily answerable, while others may require elaborate, complex and detailed information. Reference to nationality, race, caste, religion and place of birth has been regarded as evidence of discriminatory attitudes and should be avoided. An application form should be designed to serve as a highly effective preliminary screening device, particularly, when applications are received in direct response to an advertisement and without any preliminary interview.

The application can be used in two ways: (i) to find out on the basis of information contained therein as to the chances of success of the candidate in the job for which he is applying, and (ii) to provide a starting point for the interview.

It is often possible to reject candidates on the basis of scrutiny of the application as they are found to be lacking in educational standards, experience or some other relevant eligibility and traits.

Selection Strategy

Consideration of selection strategy emphasizes (i) vacancy ratio (number of candidates available for the vacancy) and (ii) the probable cost of appointing an unsuitable candidate as the two most relevant parameters. These may be regarded as independent issues and can therefore be represented as the vertical and horizontal axis of a diagram as follows:

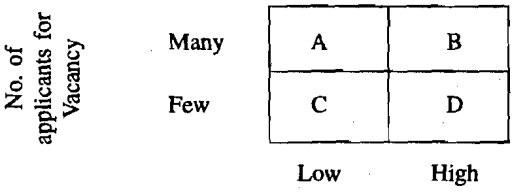

Fig. 2.2 : Selection Strategy

Probable cost of selecting unsuitable candidates: Four situations – A, B, C, D are represented in Fig. 2.2 given above. Now we consider probable solutions for each.

Situation A: In this situation there are many applicants and the cost of wrong selection is low, e.g., little investment is needed to train the recruits. The obvious strategy here would be to apply screening devices, such as application blank, short interview etc. which involve minimum cost.

Situation B: In this situation there are many applicants and the cost of wrong selection is very high. The right selection strategy would be tests, medical examination and series of interviews to prevent wrong selection.

Situation C: Here we find very few candidates but the cost of wrong selection is low; the strategy here would be, take of them (if there are so many vacancies) and see how they turn out.

Situation D: Here we find few candidates but the cost of wrong choice is very high. There is no obvious strategy. The management has to depend upon experience for guidance.

2.6 SELECTION TESTS

A test is a sample of an aspect of an individual's behaviour, performance or attitude. It can also be a systematic procedure for comparing the behaviour of two or more persons.

Purpose of Tests: The basic assumption underlying the use of tests in personnel selection is that individuals are different in their job-related abilities and skills and that these skills can be adequately and accurately measured.

Tests seek to eliminate the possibility of prejudice on the part of the interviewer or supervisor. Potential ability only will govern selection decisions.

The other major advantage is that the tests may uncover qualifications and talents that would not be detected by interviews or by listing of education and job experience.

Types of Tests: The various tests used in selection can be put into four categories:
(a) Achievement or Intelligence Tests, (b) Aptitude or Potential Ability Tests,
(c) Personality Tests, and (d) Interest Tests.

These tests and what they measure are described below.

a) **Achievement or Intelligence Tests**

These are also called 'proficiency tests'. These measure the skill or knowledge which is acquired as a result of a training programme and on the job experience. These measure what the applicant can do. These are of two types:

Test for Measuring Job Knowledge: These are known as 'Trade Tests'. These are administered to determine knowledge of typing, shorthand and in operating calculators, adding machines, dictating and transcribing machines or simple mechanical equipment. These are primarily oral tests consisting of a series of questions which are believed to be satisfactorily answered only by those who know and thoroughly understand the trade or occupation. Oral tests may be supplemented by written, picture or performance types.

Work Sample Tests: These measure the proficiency with which equipment can be handled by the candidate. This is done by giving him a piece of work to judge how efficiently he does it. For example, a typing test would provide the material to be typed and note the time taken and mistakes committed.

b) **Aptitude or Potential Ability Tests**

These tests measure the talent or ability of a candidate to learn a new job or skill. Through these tests you can detect peculiarity or defects in a person's sensory or intellectual capacity. These focus attention on particular types of talent such as learning, reasoning and mechanical or musical aptitude. 'Instruments' used are variously described as tests of 'intelligence', 'mental ability','mental alertness', or simply as 'personnel tests'. These are of three types:

Mental Tests: These measure the overall intellectual ability or the intelligence quotient (I.Q.) of a person and enable us to know whether he has the mental capacity to deal with new problems. These determine an employee's fluency in language, memory, induction, reasoning, speed of perception; and spatial visualisation.

Mechanical Aptitude Tests: These measure the capacity of a person to learn a particular type of mechanical work. These are useful when apprentices, machinists, mechanics, maintenance workers, and mechanical technicians are to be selected.

Psychomotor or Skill Tests: These measure a person's ability to do a specific job. These are administered to determine mental dexterity or motor ability and similar attributes involving muscular movement, control and coordination. These are primarily used in the selection of workers who have to perform semi-skilled and repetitive jobs, like assembly work, packing, testing, inspection and so on.

c) **Personality Tests**

These discover clues to an individual's value system, his emotional reactions, maturity and his characteristic mood. The tests help in assessing a person's motivation, his ability to adjust himself to the stresses of everyday life and his capacity for inter-personal relations and for projecting an impressive image of himself. They are expressed in terms of the relative significance of such traits of a person as self-confidence, ambition, tact, emotional control, optimism, decisiveness, sociability, conformity, objectivity, patience, fear, distrust, initiative, judgement, dominance, impulsiveness, sympathy, integrity, and stability. These tests are given to predict potential performance and success for supervisory or managerial jobs.

The personality tests are basically of three types:

Objective Tests: These measure neurotic tendencies, self-sufficiency, dominance, submission and self-confidence.

Projective Tests: In these tests, a candidate is asked to project his own interpretation onto certain standard stimuli. The way in which he responds to these stimuli depends on his own values, motives and personality.

Situation Tests: These measure an applicant's reaction when he is placed in a peculiar situation, his ability to undergo stress and his demonstration of ingenuity under pressure. These tests usually relate to a leaderless group situation, in which some problems are posed to a group and its members are asked to reach some conclusions without the help of a leader.

d) **Interest Tests**

These tests are designed to discover a person's areas of interest and to identify the kind of work that will satisfy him. The interest tests are used for vocational guidance, and are assessed in the form of answers to a well-prepared questionnaire.

Limitations of Selection Tests: From the basic description of tests described above, one should not conclude that a hundred per cent prediction of an individual's on-the-job success can be made through these tests. These tests, at best, reveal that candidates who have scored above the predetermined cut-off points are likely to be more successful than those who have scored below the cut-off point.

Tests are useful when the number of applicants is large. Moreover, tests will serve no useful purpose if they are not properly constructed or selected or administered.

Precautions in using Selection Tests: Test results can help in selecting the best candidates if the following precautions are taken:

i) Norms should be developed as a source of reference on all tests used in selection and on a representative sample of people on a given job in the same organisation. This is necessary even though 'standard' tests are available now under each of the above categories. Norms developed elsewhere should not be blindly used because companies differ in their requirements, culture, organisation structure and philosophy.

ii) Some'Warm up' should be provided to candidates either by giving samples of test, and/or answering queries before the test begins.

iii) Tests should first be validated for a given organisation and then administered for selection of personnel to the organisation.

iv) Each test used should be assigned a weightage in the selection.

v) Test scoring, administration and interpretation should be done by persons having technical competence and training in testing.

Activity 3

a) Was any psychological test administered to you for selection or promotion?

Yes ☐ No ☐

b) If yes, can you recall at what stage of your career was it given and what were you required to do?

.....

.....

.....

Later promotion to.....	.....	.....
.....	.....	.....
.....	.....	.....

2.7 INTERVIEW

We shall now discuss the post application form interview and not the preliminary interview.

Personal interview is the most universally used tool in any selection process.

Meaning and Purpose

An interview is a conversation with a purpose between one person on one side and another person or persons on the other. An employment interview should serve three purposes, viz., (i) obtaining information, (ii) giving information, and (iii) motivation. It should provide an appraisal of personality by obtaining relevant information about the prospective employee's background, training work history, education and interests. The

candidate should be given information about the company, the specific job and the personnel policies. It should also help in establishing a friendly relationship between the employer and the applicant and motivate the satisfactory applicant to want to work for the company or organisation.

In practice, however, it may turn out to be a one-sided affair. It helps only in obtaining information about the candidate. The other two purposes are generally not served.

Types of Interviews

Informal Interview: This may take place anywhere. The employer or a manager in the personnel department, may ask a few questions, like name, place of birth, previous experience, etc. It is not planned and is used widely when the labour market is tight and you need workers very badly. A friend or a relative of the employer may take a candidate to the house of the employer or manager where this type of interview may be conducted.

Formal Interview: This is held in a more formal atmosphere in the employment office by the employment officer with the help of well-structured questions. The time and place of the interview are stipulated by the employment office.

Planned Interview: This is a formal interview carefully planned. The interviewer has a plan of action worked out in relation to time to be devoted to each candidate, type of information to be sought, information to be given, the modality of interview and so on. He may use the plan with some amount of flexibility.

Patterned Interview: This is also a planned interview but planned to a higher degree of accuracy, precision and exactitude. A list of questions and areas is carefully prepared. The interviewer goes down the list of questions, asking them one after another.

Non-directive Interview: This is designed to let the interviewee speak his mind freely. The interviewer is a careful and patient listener, prodding whenever the candidate is silent. The idea is to give the candidate complete freedom to 'sell' himself without encumberances of the interviewer's questions.

Depth Interview: This is designed to intensively examine the candidate's background and thinking and to go into considerable detail on a particular subject of special interest to the candidate. The theory behind it is that if the candidate is found good in his area of special interest, the chances are high that if given a job he would take serious interest in it.

Stress Interview: This is designed to test the candidate and his conduct and behaviour by putting him under conditions of stress and strain. This is very useful to test the behaviour of individuals under disagreeable and trying situations.

Group Interview: This is designed to see how the candidates react to and against each other. All the candidates may be brought together in the office and they may be interviewed. The candidates may, alternatively, be given a topic for discussion and be observed as to who will lead the discussion, how they will participate in the discussion, how each will make his presentation and how they will react to each other's views and presentation.

Panel Interview: This is done by members of the interview board or a selection committee. This is done usually for supervisory and managerial positions. It pools the collective judgement and wisdom of members of the panel. The candidate may be asked to meet the panel individually for a fairly lengthy interview.

Interview Rating

Important aspects of personality can be categorised under the following seven main headings:

- *Physical Make-up:* Health, physique, age, appearance, bearing, speech.
- *Attainments:* Education, occupational training and experience.
- *Intelligence:* Basic and 'effective'.
- *Special Aptitudes:* Written and oral fluency of expression, numerary, organisational ability, administrative skill.

- *Interests:* Intellectual, practical, physically active, social, artistic
- *Disposition:* Self-reliance, nature, motivation, acceptability.
- *Circumstances:* Domestic, social background and experience, future prospect.

This is called 'The Seven Point Plan'. The importance of each of these points will vary from organisation to organisation and from job to job. Hence, these should be assigned weightage according to their degree of importance for the job.

On the basis of information gathered through an interview, each candidate should be rated in respect of each point given above as (i) outstanding, (ii) good, (iii) above average, (iv) below average, or (v) unsatisfactory. Marks should be allotted to each of these, and the score for each point is arrived at by multiplying it by weights and the total of all these will determine the final position of a candidate at the interview.

Limitations of Interviews

Interviews have their own limitations in matters of selection. Some of these are mentioned below:

- Subjective judgement of the interviewer may be based on his prejudices, likes, dislikes, biases, etc.
- One prominent characteristic of a candidate may be allowed to dominate appraisal of the entire personality.
- The interviewer's experience may have created a close association between some particular trait and a distinctive type of personality.
- Some managers believe that they are good at character analysis based on some pseudo scientific methods and are guided by their own abilities at it.

Qualities of 'Good' Interviewers

A good interviewer should have the following qualities:

- Knowledge of the job or other things with which interviews are concerned.
- Emotional maturity and a stable personality.
- Sensitivity to the interviewee's feelings and a sympathetic attitude.
- Extrovert behaviour and considerable physical and mental stamina.

Guidelines for Improving Interviews

Not all interviews are effective. Their effectiveness can be improved if the following points are kept in mind by an interviewer:

- An interview should have a definite time schedule with ample time for interview. It should not be hurried.
- The impersonal approach should be avoided.
- Interview should have the necessary element of privacy.
- The interviewer should listen carefully to what the applicant says and the information collected should be carefully recorded either while the interview is going on or immediately thereafter.
- Attention should be paid not just to the words spoken, but also to the facial expressions and mannerisms of the interviewee.
- The interview should end when sufficient information has been gathered.
- The interviewee should be told where he stands—whether he will be contacted later, whether he is to visit another person, or it appears that the organisation will not be able to use his abilities.

Pseudo-Scientific Methods of Selection

In the past, and to some extent even now, stereotyped impressions of personality and characteristics were used as a basis of selection. These impressions were gathered through pseudo-scientific methods, like phrenology, physiognomy and graphology.

We shall briefly describe below these methods for your background knowledge only:

Phrenology: Here it is believed that the strength of each faculty is indicated by prominent bumps on certain parts of the skull.

Physiognomy: Here it is believed that there is a definite correlation between facial features and psychological functions and behaviour, e.g., thin lips indicate determination, broad jaws signify tenacity and so on.

Graphology: Here it is believed that there is a close relationship between handwriting and personality.

Activity 4

Please find out from your Personnel Department which of the above mentioned t) of interviews they use for the purpose of selection. What do they aim to judge through each of these interviews and for selection of what level of employees are these used? Write below the information you collect.

Types of interviews	Points to be judged	Level of employees
1.	.....	.....
2.	.....	.....
3.	.....	.....
4.	.....	.....
5.	.....	.....

2.7 PHYSICAL EXAMINATION

Applicants who get over one or more of the preliminary hurdles, are sent for a physical examination either to the organisation's physician or to a medical officer approved for the purpose.

Purposes: A physical examination serves the following purposes:

i) It gives an indication regarding fitness of a candidate for the job concerned.

ii) It discovers existing disabilities and obtains a record thereof, which may be helpful later in deciding the company's responsibility in the event of a workman's compensation claim.

iii) It helps in preventing employment of those suffering from some type of contagious diseases.

iv) It helps in placing those who are otherwise employable but whose physical handicaps may necessitate assignment only to specified jobs.

Contents of Physical Examination: Physical examination covers the following:

- The applicant's medical history.
- His physical measurements—height, weight, etc.
- General examination—skin, musculature and joints.
- Special senses—visual and auditory activity.
- Clinical examination—eyes, ears, nose, throat and teeth.
- Examination of chest and lungs.
- Check-up of blood pressure and heart.
- Pathological tests of urine, blood etc.
- X-ray examination of chest and other parts of the body.
- Neuro-psychiatric examination, particularly when medical history or a physician's observations indicate an adjustment problem.

You would realise that the importance of these characteristics varies from job to job and, therefore, different weightages have to be given to each for an overall evaluation.

2.9 REFERENCE CHECKS AND FINAL DECISION

The applicant is asked to mention in his application the names and addresses of, usually, three such persons who know him well. These may be his previous employers, friends, or professional colleagues. They are approached by mail or telephone and requested to furnish their frank opinion, without incurring any liability, about the candidate either on specified points or in general. They are assured that all information supplied would be kept confidential. Yet, often either no response is received or it is generally a favourable response. Applicants who cross all the hurdles are finally considered. If there are more persons than the number required for a job the best ones, i.e., those with the highest scores are finally selected.

2.10 PLACEMENT

Sometimes a particular person is selected for a given job. Often more than one person may be selected for the jobs of similar nature. In the second case, individual employees have to be put under individual supervisors with the approval of the latter. In the first case also his approval is also necessary but it should be done early in the selection process.

A proper placement reduces employee turnover, absenteeism and accident rates and improves morale.

2.11 INDUCTION, ORIENTATION OR INDOCTRINATION

This is the last activity in relation to a newly employed person before he is trained for his job.

Meaning

As explained earlier, it is introduction of an employee to the job and the organisation. The primary purpose is to 'sell' the company to the new employee so that he may feel proud of his association with the company.

Purpose and Need

An employee has to work with fellow employees and his supervisor. For this he must know them, the way they work and also the policies and practices of the organisation so that he may integrate himself with the enterprise. Any neglect in the area of induction and orientation may lead to high labour turnover, confusion, wasted time and expenditure.

Induction Programme

A good induction programme should cover the following:

- The company, its history and products, process of production and major operations involved in his job.
- The significance of the job with all necessary information about it including job training and job hazards.
- Structure of the organisation and the functions of various departments.
- Employee's own department and job, and how he fits into the organisation.
- Personnel policy and sources of information.
- Company policies, practices, objectives and regulations.
- Terms and conditions of service, amenities and welfare facilities.
- Rules and regulations governing hours of work and over-time, safety and accident prevention, holidays and vacations, methods of reporting, tardiness and absenteeism.
- Grievances procedure and discipline handling.

- Social benefits and recreation services.
- Opportunities, promotions, transfer, suggestion schemes and job satisfaction.

An induction programme consists primarily of three steps:

General orientation by the staff: It gives necessary general information about the history and the operations of the firm. The purpose is to help an employee to build up some pride and interest in the organisation.

Specific orientation by the job supervisor: The employee is shown the department and his place of work; the location of facilities and is told about the organisation's specific practices and customs. The purpose is to enable the employee to adjust with his work and environment.

Follow-up orientation by either the personnel department or the supervisor: This is conducted within one week to six months of the initial induction and by a foreman or a specialist.

The purpose is to find out whether the employee is reasonably well satisfied with him. Through personal talks, guidance and counselling efforts are made to remove the difficulties experienced by the newcomer.

2.12 LET US SUM UP

This unit has helped you to follow the process of selection in an organisation right from the conception of an idea that a suitable person is to be put on a given job to the point of ultimately selecting the most suitable person for it, putting him at ease and making him feel at home with his fellow employees, his supervisor and the organisation as a whole. It has helped you to understand the various activities involved in the process and the order in which these are carried out. It has given you insight into the various alternatives and methods of various activities and under what circumstances each is advisable. It has also helped you to realise the various precautions to be taken so that your efforts under each activity bring desired results.

2.13 SELF-ASSESSMENT TEST

Take each of the objectives stated at the beginning of the Unit and regard it as a question. Working from memory, write not more than half a page on each so that you may assess whether you can recall the main points contained in the unit.

UNIT 3 TRAINING AND DEVELOPMENT

Structure

3.0 OBJECTIVES

After going through this unit, you should be able to:

- describe the reluctance of training in improving the job performance of the employees of the hospital in providing a better quality of patient care;
- decide the job responsibilities for the employees with the help of their respective supervisors and divide them into tasks;
- identify the deficiencies in job performance of all the categories of employees which can be rectified by training;
- list the principles of adult learning;
- select the trainees centred and trainer centred approach appropriately;
- prepare a training curriculum for rectifying their gaps in performance, in collaboration with the trainers;
- evaluate the training i.e. the training course, improvement in the job performance of employees, its impact on the improvement of patient care and the cost benefit of training; and
- chalk out a training plan—short-term and long-term for hospital.

3.1 INTRODUCTION

The primary aim of a hospital is to provide good quality patient care. The patient/ client attending the hospital should be given top priority. This care can be imparted by the qualified and trained staff only.

The key being the staff delivering the services, due emphasis should be given in the planning of the staff requirement alongwith the skills required by them. The qualified staff will remain in the organisation if there are good promotional avenues and the sincere workers are rewarded. This requires career planning and a fair performance appraisal and personnel policies.

Competent personnel can be appointed only if there is a rational and fair process of recruitment and selection. Further, the personnel appointed should be placed in the right job. There should be no square pegs in round holes. This is discussed in Unit 2.

A worker can do his job best when the job expected out of him is crystal clear to him and he possesses the knowledge, attitude and skills required for the job. This will necessitate imparting tailor made, need based training. The planning, implementing and evaluating the training necessary for the staff of the hospital is being discussed in this Unit.

3.2 RELEVANCE OF TRAINING

- We invariably send the most hard working employees for training especially foreign training as an appreciation of their good work. This is a common reply that most administrators give as the criteria used for nominating employees for training.
- Now that you have had a nice time you might as well get down to work. This is the welcome given to the employee when he returns from a foreign training and presents a bottle of scotch brought from the duty free shop to the administrator after profusely thanking him to give an opportunity to tour abroad.
- Training is a waste of money. There are no changes in performance when the employees come back to work. Lament most administrators.

We bet you will agree with that these situations are common and not few and far between. Our questions to you is: Are you one of these administrators? You need not answer this question but just think over it for a few minutes.

We admit training is not a panacea for all the ailments in your set up but any such attitude by the administrator will ensure that the training is not effective at all. Training may not do wonder but will definitely improve the performance. The investigations in the laboratories are not very reliable at times not only because the employees are not sincere but also because the technicians are not fully skilled on the equipment they are using and the supervisors lack supervisory skills particularly skills for supportive supervision.

Training if imparted objectively to the right person will definitely improve performance provided the deficiency in performance is not due to inappropriate instruments or managerial problems. Don't you find the performance of your doctors improve after they go and learn a new technique. The same applies to all the employees of your hospital. A properly chalked training plan over a period of couple of years will result in not just improvement in the technical performance of the employees but surprisingly also their inter-personal communication behaviour, motivation and even their ability to take right decisions and shoulder more responsibilities.

An administrator's job is not just limited to nominate the right employee for training or holding consultation with the trainers to conduct need based training. To make the employees perform upto the mark has to plan and innovate changes in the atmosphere where the employees are given more independence to take decisions and shoulder responsibilities (under supervision of course which may be covertly or overtly done). Training should always be reviewed and planned as a long-term strategy taking the goals and proposed future developments of the hospital.

You will be learning about training from the administrators' point of view in this unit and not from the trainers' point of view. The aim is not to make you a trainer but enable you to guide the trainer you appoint about what is expected out of him. Further, you will be able to evaluate the training being conducted, the trainers trained and find out the cost-benefit or even cost effectiveness (if possible).

3.3 TRAINING NEED ASSESSMENT

I hope by now you realize that the performance of individuals can be improved by carefully designed need based training. So we proceed towards designing need based training. However, if you are not convinced that training will improve performance will request you to critically observe those employees who are not performing up to the desired level. Are all of them not interested in work with a 'Chalta hai' attitude? I am sure that is not the case. (In fact, motivational levels can also be increased by training.) Some would be lacking in the requisite clinical or technical skills (we arrogantly call them as not intelligent enough). Some may be having problems, managing their jobs properly or not being able to take appropriate decisions. (We call them as disorganized and confused.) Some would have problems in communicating with people especially interpersonal communication. (We call them as insensitive people or as outright rude.) Now what do you think if they are given specific training keeping their deficiencies in mind? Won't their performance improve? I bet you will agree with me. In case you do, you have arrived at the first step of training — i.e. the training should be need based.

Before proceeding further let's make the ground rules clear so as to be on the same wavelength. In this unit 1 will be considering you as an administrator or manager who is planning the training in the hospital and holding discussion and advising the trainers and not conducting the training himself.

Once we have agreed that the training will be effective if it is need based, then the next question is how do we diagnose that elusive 'Training need'. Before proceeding to 'how' let's first examine 'what' that training needs is. As an administrator your primary aim is that the employees should work well or perform their duties well. In other words they should perform their duties at the desired level. This desired level of performance is decided by you. If may or may not be described in concrete terms or not even explained to the employee.

3.3.1 Job Responsibilities and Task Analysis

The first step which you will have to perform even before attempting to assess the training needs is the identification of the job responsibilities or job description of every employee. This will involve analysing his job and what is expected out of him. Numerically it will come to the responsibilities he has generally got to perform and duties he has got to perform sometimes. Once these responsibilities have been listed out the next step would be do a task analysis.

Task Analysis

Each duty which an employee performs when analysed in detail would show us that it comprises a number of smaller tasks which have to be performed. A duty like immunizing a child would comprise a number of tasks like:

i) determining the age of the child,

ii) determining the immunization status of the child,

iii) enquiring about the reaction to previous immunization,

iv) setting up of the immunization clinic,

v) packing of the vaccine carrier or proper storage of vaccine in the refrigerator,

vi) determining the correct dose of the vaccine,

vii) administrating the vaccine by the correct route, and

viii) maintaining appropriate records to show that the vaccine has been administered.

Once the task analysis has been done, the standard of performance has to be determined. This standard may be different for different level of workers. For instance suturing is done by nurses, doctors, surgeons and plastic surgeons. The standard of performance would be different. A very good suture by a nurse may be labelled as poor by a plastic surgeon. The administrator has to decide the level of performance for his organisation. Once this is done we know exactly the desired level of performance of all the employees.

3.3.2 Determining Training Needs

The next step is determining the present level of performance of each task. I am sure you must have guessed it that the best way to determine the level of performance is by observing the employee. This is easier than done as it is generally not feasible to observe a large number of employees performing a variety of jobs. So other simple methods are adopted to simplify them. They are:

1) Interviewing the employees and also asking them to fill questionnaires to know their knowledge and determine some of their's attitudes.
2) Interviewing their supervisors, peers and sometimes their subordinates to identify the gap in their performance.
3) Reviewing of their performance appraisal reports and personal records.
4) Self-appraisal of the employees.
5) Determining client satisfaction.

Using an optimum mix of one or more methods would tell us about the actual level of performance of the employee (Y). This discrepancy in performance (X-Y) will give us a list of tasks which need to be improved upon. From this list we examine and eliminate the non-training interventions (Z). Finally, we will get a list of tasks which can be improved upon by training (X-Y-Z).

These tasks will then be prioritized. To this we will add the future needs of the employees based on the future plans of the hospital.

These are the training needs of the employees.

Macro Needs and Micro Needs

Macro needs are those needs, which exists for a large number of employees. Supposing the laboratories in your hospital has recently acquired computerized auto analysers. May be all your technicians will be required to undergo training. This is the macro need. Micro needs would be some specific training needs of some employees.

3.4 PRINCIPLES OF ADULT LEARNING

All of us went to school when we listened attentively to our teachers (at least those whom we liked) and tried to absorb every word they spoke. Whatever the teacher spoke was taken as the gospel truth with a firm faith that the acquired knowledge would do wonders in our lives. Do we still exhibit that behaviour? I don't think so. If we have changed over the years others must also have changed. So we must organise course in a manner conducive for the adults to learn.

Research shows us that the ability to learn remains unimpaired throughout life though they may underestimate their ability to learn and therefore have a lack of confidence in their learning. The trainer has a responsibility in trying to restore that lost confidence.

Adults display interest in learning those things which may help them in their lives or in their job. Hence the need for designing a need based training course. The learning process is related to and makes use of the experience of the learners. The trainer should conduct training in a manner where the experiences of the learners is exploited to the maximum. This may involve methods as discussion, role playing, case method etc. The new learning should be applied to their experiences to make learning more meaningful.

The adults are over cautious of their status and scared of embarrassing situations. The training should be made in a manner that they are comfortable. The in breaking games are very helpful and the time spent on them is actually helpful in making the atmosphere conducive to learning. Their self-esteem should be respected and at no point should they be put in embarrassing situations. They should not be snubbed even if they are obviously wrong. Their statements should be rephrased and told in a polite manner. The participation of the trainees should be high. They should be given plenty of practice along with feedback. The feedback provided should be positive helping them to convert themselves and improve their knowledge and skills. Negative feedback is considered to be counter productive.

Maintaining a high motivational level helps the learning process. This can be done by quoting work related problems and providing a clear performance target. Treating them with respect and giving them responsibility and providing variety in training keeps the trainees motivated. This physical environment viz., the seating pattern, lighting, temperature if conducive also motivates the learners.

Last and perhaps the most important as the course progresses; the dependency of the trainee on trainer should decrease and he should assume increasing responsibility for planning their own learning. The best course is one where at the end the trainee says that he "Learnt everything himself".

3.5 APPROACHES TO TRAINING

As we have already seen learning is best when the trainee is well motivated and is actively involved in taking the responsibility of learning on himself. This is possible when the trainer creates an atmosphere when the trainee individually or in groups works towards achievement of the goals and objectives of training and the trainer acts as a facilitator helping the process of learning. There is active learning by the trainee. This is known as the 'Trainee Centred Approach'. This has been found most effective in the training of adults and the training methods selected by the trained should fit with this approach.

However in hospitals, especially when it comes to clinical practice or the use of sophisticated equipment there is only one correct way of doing the things. For example, there is only one way of inserting Ryles tube and giving Ryles tube feeding. There is only one way of incubating a child. These tasks which can be done only in one way are known as "Reproductive Tasks'. In training personnel in such tasks there is only one way the training can be imparted. In such tasks the trainer demonstrates to the trainees what is expected out of him i.e. how to perform the task and assess the performance on the level of achievement by the trainee using a checklist. (This is explained in the sub-unit on Evaluation.) This is the Trainer Centred Approach and to make it effective after efforts should be made to have active participation and practice by the trainees. In imparting knowledge by lecture method the learning is passive. Efforts may be made to involve the trainees by asking questions or making the 'didactic lecture' a 'lecture discussion'. Active learning is more effective than passive learning and efforts should be made to reduce the latter in training.

3.5.1 Types of Training

Induction Training

Induction training as the name implies is the training imparted to the new employees 'inducted' in the organisation. Induction training helps in orienting the new recruit towards organisation and its goals. Few examples of good induction training are Lal Bahadur Shastri National Academy of Administration, Mussoori for the IAS Officers and Indian Military Academy for the Officers Recruited in the defence services. Induction training is especially important when we have people from different educational schemes for the same job.

Placement Training

Placement training is training imparted to an individual before he is 'placed' in a new section or department. It is something like a smaller version of induction training.

Inservice Training

Inservice training is the training imparted to the employees during their service with the aim of acquiring the new skills and brushing up the old ones. A well planned need based inservice training course improves the motivation and morale of the staff along with their job performance. It may be on or off the job, off the job is normally institutional training.

On-the-job Training (OJT)

In on-the-job training the trainer comes to the place of work of the trainee. The trainer is observing the trainee, guiding him and removing his faults. OJT is perhaps the best form of need based practical skill based training. The trainee can relate it to his job immediately and put it in practical use. This is perhaps the best form of training possible especially for the lower level workers.

Promotional Training

A surgeon is promoted to the post of HOD Surgery. The new job involves a lot of administrative work alongwith the planning for the future. If justice has to be done to this additional work time will have to be devoted. The total time in a day is constant, so time has to be taken out from other activities—in this case clinical and surgical. A well designed promotional training is able to bring to focus the change in job requirements of the employee after promotion as well as give skills to perform it well.

3.6 OBJECTIVES OF TRAINING

The objective of training is to achieve a clearly defined performance. It describes what a trainee should be able to do at the end of training that they would not do before hand. They may be also called as 'Learning Objectives' as opposed to 'Teaching Objectives'. They define what the trainee, not the trainer, should be able to do.

The aims are directed towards the trainer while the general and specific objectives are directed towards the trainers. A training course is the process of providing learning experience for trainees and results in desired end products called learning outcomes. These outcomes are what the trainees have learnt and can do.

Elements of a specific educational objective:

Act Contents Condition	Task
and Criteria	

Act: It is the description of the task aimed at, expressed by an active verb.

Content: It specifies the subject, the theme or substance in relation to which the act is to be performed.

Condition: It is the description of the circumstances in which the act must take place.

Criterion: It is the desired level of performance expected from the trainee.

The specific objective should be relevant, logical, feasible, observable and most importantly measurable.

It should always state what the trainee must be able to do at the end of training. At the end of the training the trainee will be able to weigh the child on a spring balance upto an accuracy of 100 gms.

Weigh	—	Act
The child	—	Content
On a spring balance	—	Conditions
Accuracy of 100 gms	—	Criteria

Check Your Progress 1

Which of the two objectives are written in performance or behavioural terms.

a) The trainee will be able to autoclave syringes and needles in a pressure cooker.

b) The trainee will be able to understand how to autoclave syringes and needles in a pressure cooker.

The act of writing down an objective is merely that what was once a secret is now open for inspection and improvement.

.....

.....

.....

.....

3.7 TRAINING METHODS

The outcome an inservice training programme depends not only on the knowledge and information imparted but also on the skills of presentation i.e. the training method used. In the recent past the main emphasis in the context of training method has been on:

i) Reduction in didactic teaching.

ii) Promotion of participatory approach in training.

The classical method of 'chalk and talk' through, has its own place in the scheme of things, yet it has been replaced by what has been called as 'experiential learning'. The shift of focus can be discerned by a schematic diagram given below:

Minimum participation of trainers				Maximum participation of trainees including experiences	
Learned Paper	Pure Lecture	Lecture and Q	Lecture discussion	Pure discussion workshop	Case method role play brainstorming counselling

The basic contention in participatory training methods is that it is usually easier to change the attitudes and behaviour of people by making them learn through discussion, activity and experiences.

3.7.1 Lecture Method

A classical lecture is a situation where an expert gives a talk on a subject to a large audience and 'information' is communicated to others. It has limited involvement of the participants and also doesn't ensure that the participants have 'learnt' what was 'taught'. In inservice training the lecture should provide the trainees specific job related information. Therefore, the effort is to involve the trainees in session for their maximal benefit and the term 'lecture discussion' is used differentiating of it from 'didactic' lecture.

The structure of a lecture normally is:

Introduction

The objective of the lecture is stated and the learners are explained what they should expect and how they are expected to participate.

Development

It is during this period that the information is communicated and to be effective, it should be organised. Some planning guidelines are that people learn best by moving from the

—known to the unknown

—simple to the complex

—concrete to the abstract

—observation to the theory

—general to the particular

Questions should be asked to assess if the information is being acquired by the trainees. Key points should be repeatedly emphasised. The contents may be decided on the basis of the objectives as what the trainees 'must' know, 'should' know and 'could' know.

Summary

The major points of the lecture are summarised. This helps the trainees to remember the 'must know' portion of the session. Questions may be asked to know the level of achievement of performance. The trainees should be guided for further reading and trainees be thanked in the end.

Perhaps the oldest method of training, jokingly it is said that it has survived because the trainer teaches what he wants to teach and the learner listens to what he wants to listen. So no complaints. This is precisely the greatest drawback of this method. We have already discussed that learning is best when there is active participation and intense activity by the learner. The learner here is just a passive listener. Further studies have shown that the concentration of the learner starts dipping after 20-25 minutes even if the lecture is interesting. The method can be made more effective (we cannot do away with it) by making it more interactive in an informal and supportive atmosphere and the effective use of audio visual aids.

3.7.2 Role Play

The trainees assume a role and enact it in front of the group. It helps in developing insight into the behaviour of self and others. The role player can examine delicate problems in human or inter-personal relation.

Role play is an effective training method when the objective is an attitudinal change dealing with feelings and emotion. For example, how to communicate to the mother about the death of her child on the operation table may be demonstrated very accurately through a role play. A lecture may not be able to explain the verbal and non-verbal gestures so easily displayed through a role play. Similarly for teaching counselling skills role play again is perhaps the best method. However, a role play may be successfully used for training skills like history taking, filling of ANC card etc.

In a role play the script (verbal statement) along with the feelings associated are given to all the role players which they enact in front of the audience. Such role plays are known as structured role plays. On the other extreme the situation is explained to the actors and the script is open. These are unstructured or spontaneous role plays. In the middle come semi structured role plays. Spontaneous role plays bring out the feelings very well and are very useful in imparting training in communication and counselling skills. Structured role plays are used in management training especially for negotiation skills.

Steps in Designing a Role Play

Once the trainer has specified the objectives and decided upon role play as the method of training he devises a scenario. It may require a writing brief introduction about setting the scenario. The roles are then identified. Depending on the type of role play conducted the script for the roles may need to be written. The role players may then have to be explained about the situation and their role either in groups or individually (depending upon how the role play is conceived). The role play is then enacted in front of the other trainees. It is followed by debriefing or past role play discussion. The views of the audience and the players is sought after which the trainer sums up. This debriefing is very important and the outcome of the role play is largely dependent on this. This should never be 'hurried up' as this is a sure way of ensuring that the

role play is not useful to the participants. One rule of the thumb is that the time taken in debriefing should be equal to the time taken in running the role play. Few don'ts about the role play are that as a rule the players performance should never be criticised. The advise and assistance by the trainer should never be withheld and the debriefing should not be crammed with an inadequate time.

Advantages of role play are that it is a highly stimulating trainee centred method of training allowing them to practice social skills and the skills of articulating and empathizing along with the skills of decision making, problem solving and negotiating. It provides a real life situation in the classroom along with immediate feedback which can effect attitude changes for the better. Feelings and emotions are given free rein.

The disadvantages of a role play are that the results can be unpredictable. It may not be regarded as a serious form of training by other trainers. It may give the trainees an impression of perfect understanding when the real life situation is more complex. It may be a wasteful of time if the method is used with inadequate preparation or wrong selection.

3.7.3 Case Method

Case method is an experiential method of learning. Learning follows experience. It comes from learner himself. Every individual's experience is unique to himself. None can tell him what he is to learn or gain from any activity. Learning can be devised but it is for the participant to validate for himself.

Case method uses a description of a real life situation, records for use in a training session as material for discussions and learning. Case leads upto a problem but gives no answer of any kind; no one right answer is obvious. The case method is particularly suitable for developing multiple ways of thinking because it forces a trainee to think in terms of particulars. The method through group discussion produces a wide range in opinions. The trainer merely acts as a facilitator than as a speaker. He listens to the discussions but remains quite during the discussion phase and only very occasionally shares his personal perceptions of the matter, that too to keep the level of the discussion high and going. In the end he rephrases and clarifies viewpoints on the basis of available information and knowledge on the theme.

Objectives of the Case Method

—To give trainees the feel of real life situations.

—To impart greater knowledge and understanding of man and matters.

—To help trainees discover for themselves facts and ideas which are meaningful in a particular situation.

—To sharpen the power to think logically about certain facts, analyse them and arrange them in order of priority.

—To help in discovering and defining the vital questions and finding out answers to these questions.

—To develop problem solving abilities.

—To develop the ability to appreciate other people's feelings and arrangements and modify conclusions in the light of the discussions with others.

—To help the trainees to understand that there can be more than one solution to a problem and acquire fresh ideas from the experience of others.

—To enable the trainees to learn principles and ideas which have applicability in the real situations.

Types of Cases

—Fabricated cases

—Audio-visual cases

—Line cases

—Role play cases

—Actual situations

The Incident Process

—Only a bare incident is reported to the group

—Involves merely a statement

—Key information is withheld

—Case reconstructed by asking questions WHO? WHAT? HOW? WHERE? WHEN?

—Discussion follows

Methodology

a) **Case Study Analysis**

—What is going on here?

—Is there a problem at all?

—What precisely is the problem?

—What has caused it?

—Are we looking at causes or symptoms?

—What are the main issues?

—Why are these issues important?

—Whose problem is it?

—What precisely are his objectives?

—What should he try to do now?

—What possible courses of action are open?

—How realistic is each of the actions/solutions proposed?

—What are their possible effects?

b) **Case Discussion**

The case is discussed by all the course members, the case leader functioning as a discussion leader. He helps trainees to think for themselves in a non-directive way. The discussion involves free interchange of opinions and free give and take of views in an informal atmosphere. The participation and involvement of all the group members is essential not only to ensure that all participants have the advantage of obtaining training in decision making but also bringing to light different aspects of the situation. The case discussion enables the participants to develop practical skills and appropriate attitude, relevant to an administrator. For instance,

i) it develops ability of clear communication while arguing;

ii) it develops sensitizing of others viewpoints as well as insight into one's own bahaviour during social interaction.

iii) develops skills of problem solving and decision making.

Writing a Case

—Select the type of problem and organisation from which the material will be obtained.

—Observe and collect the data

—Write the case with objectivity

a) Select the detail

b) Set the scene quickly

c) Write in the past tense

d) Decide on disguises

—Clear the case

—Confirm the usefulness of the case as teaching material.

3.7.4 Group Discussion

Group discussion is an effective method when the trainees have considerable experience and maturity and a lecture is not desirable. It may also be used after a lecture to apply the concepts in their place of work.

The group discussion is initiated by a leader who introduces the topic and clarifies the purpose. Then by putting forward key questions he starts the discussion rolling. The leader is supposed to stimulate interest, ensure that all the members participate in discussion, stick to time and sequence, be impartial and be a source of information. The leader should stimulate generation of ideas by asking high order questions i.e. those having more than one answers and develop teamwork within the group. The leader should summarise the discussion and delegate action points to members if requested.

The trainer before deciding on group discussion as a method of training should consider the number of learners, their likely behaviour, the learning environment, facilities available, the time constraints and the possible learning outcome. The sitting management is very important. The advantages of a group discussion are that it is learner centred learning. Enables skills to be practised, takes into problem solving situations and the trainer acts as a coach/monitor. Further in a group the trainees give their best if the atmosphere is conducive.

The disadvantages are that it requires careful planning, the outcome is difficult to predict and dependent on learner attitude.

3.7.5 Competency Based Training

Competency based training (CBT) is distinctly different from traditional education processes. CBT is learning by doing. It is based on social learning theory which states that when conditions are ideal, a person learns more rapidly and effectively from watching someone (model) perform a skill or activity.

CBT provides health care workers with those competencies vital to the successful performance of their jobs. Unlike traditional teaching which emphasizes evaluation of what information the participant has learned, CBT emphasises evaluation of how the participants perform i.e. a combination of knowledge, attitudes, and most important skills. Terms used to describe the levels of clinical skill performance.

Skill Acquisition

The trainee knows the steps and their sequence (if necessary) to perform the required skill or activity but needs assistance.

Skills Competency

The trainee knows the steps and their sequence (if necessary) and 'can perform' the required skill or activity.

Skill Proficiency

The trainee knows the steps and their sequence (if necessary) and 'efficiently perform' the required skill or activity.

The criteria for efficiently performing the skill is standardized and is judged by using a checklist when the trainee performs. The coaching process ensures that the trainee receives feedback regarding performance.

—Before practice

—During practice

—After practice

3.7.6 Brainstorming

Brainstorming is a creative group work in which members produce large number of ideas quickly for subsequent evaluation and action. Generation of ideas in a group is more effective than trying to generate ideas individually. It can be conducted with a group ranging from 1 to 20 participants through the optimal size is about a dozen participants. Communication is directed towards the trainer or the participants who is assisting in writing the ideas on a flip chart. Short mutual conversation or consultation among the participants is permitted. Each participation in term gives his ideas. Other participants are free to develop or modify the ideas of other participants.

Some Rules/Principles

1) Do not evaluate any of the ideas stated.
2) Accept ideas as they are expressed even if they appear to be ridiculous or useless or stupid.
3) Allow free flow of ideas. Just let participant's ideas go.
4) Never mind the quality of ideas, it is quantity that counts.
5) Consider ideas produced as a common pool. Any one could pick any idea expressed by the other and change or develop on that.
6) Enjoy the session. There could be a lot of laughter or wit. Let it be work with fun.
7) Ensure that every one participates. Allow each one to call out his ideas when those occur to him.
8) Continue the process till all ideas are exhausted and members on their turn having no idea just say 'Pass'.
9) Trainer/Leader helps in summarising an idea statement and guide members in clarity of expression.
10) List down all the ideas.

Steps of Brainstorming Session/Structure of the Session

a) **Introduction:** The trainer explains broadly the rules to be followed and emphasises on each one's participation, non evaluatory nature of the exercise and generation of as many ideas as possible by them.

b) **Warming up:** To prepare the participants for real problem at hand it is essential that they may be given some practice in free flow of ideas for 3 minutes by asking them to given different uses of any day to day object. It helps to induce them to think divergently.

c) **Define/State the Problem:** The trainer states the theme/issue/problem on which he intends to have the brainstorming.

d) **Focussing the Problem:** The trainer asks the participants to give various suggestions on the stated problems by asking How do you do this? It helps to make up a series of focus statements out of which he later chooses one or two focus statements that have potential for generating further ideas.

e) **Brainstorming:** Call for the ideas pertaining to any one selected focus statement. These ideas are classified as 'Developments' and noted down under that heading on the flip chart by one of the participant who has been assigned the responsibility.

The exercise is started by signalling the participants to start. Periodic stimulation to come out with ideas is there. He may ask them to be active. He may suggest to look at any idea and ask for any extension or elaboration or variation on that. Having exhaused on 'F' statement 1, the focus statement FS2 could be taken up depending upon the time and purpose. All the ideas are recorded. Care is taken as to allow free flow of ideas without any inhibition. Questions based on five Ws (WHO, WHY, WHEN, WHERE, WHAT) and How help flow of ideas.

f) **Daftest Suggestion:** Pick the craziest suggestion from the list of developments. Ask how it can be converted into a sensible or useful idea. Write the suggestions separately not under development.

g) **Evaluation and Summary:** Trainer quickly glances at various ideas, evaluates those and immediately prioritise those according to their importance and effectiveness and summarises the findings which may be noted down by participants. There is no follow up on it. A lot depends on trainer or leaders ability to evaluate and summarise.

3.7.7 Syndicate Method

The syndicate method of training can be very effective for enhancing managerial skills especially in decision making and problem solving. A small group of 5-6 trainees is formed who study and discuss a managerial problem. The group comes out with a report which has suggested solutions. The main advantage is that the trainees draw upon their own experiences and discuss and come to a consensus. The trainees also learn how to work and adjust in a group. The report is then presented where the views of the faculty and other trainees are also received.

3.7.8 Panel Discussion

Three or four experts who are an authority in a specific subject comprise a panel. The panelists conduct an open discussion in the presence of a training group with a moderator guiding the discussion. The method is very effective when the subject matter is very complex with many facets or when there are different views on the subject. The members of the audience can also join in the discussion. The interaction amongst the panelists and the trainees helps in better understanding of the problem. Selection of a skilled moderator is very important for the panel discussion to be effective.

3.7.9 Programmed Learning

In programmed learning a trainee learns himself (self learning) by going through a series of steps. At the end of each step the trainee has to answer a few questions. Only if the questions are answered correctly does the trainee proceed to the next step.

The features of programmed learning are (ILO handbook on programmed learning):

1) Trainee works at his own pace
2) Through a series of logical steps
3) Each step leading to predefined objectives
4) Responding actively and mastering each step.
5) Recovering feedback at each step to correct and encourage the trainee.
6) The programme is pre-tested before using it.

Check Your Progress 2

Which is the best training method?

.....

.....

.....

.....

3.8 TRAINING AIDS

The trainer's aim to make the process of learning interesting and simple. Based on the observation that sight accounts for around three fourth of the senses used by man along with that the remembrance is best when vision and sight are used in combination, the trainers use aids to facilitate learning. So the training aids are in facts learning aids. They are used to clarify and simplify topics which may be difficult if explained orally.

They are effectively used to emphasize key points and maintain interest. The commonly used training aids are blackboard or chalkboard, white board, magnetic board, flip chart, flash cards, charts, overhead projector, models, audio cassettes, slides, synchronized slides and cassettes and video cassettes. The selection of the aid should be based on the necessity and suitability of the topic. It should be simple and should take into consideration the size of the audience.

Blackboard or chalkboard is the most widely available and commonly used aid. Write boldly using coloured chalks if necessary. Do not talk while writing on the board. Turn around and talk to the audience and do not stand in the middle of the board obstructing the view.

The whiteboard is like the blackboard except that pens are used instead of chalks. The magnetic board is used by placing prepared cards on it. Both are costly but effective aids if available. The flip chart is also used like a blackboard with the difference that the charts can be reused. Further good quality charts can be made in advance. Notes can be written lightly by a pencil which the trainer can read but the trainees cannot see. Sequence should be pre-arranged and rehearsed prior to the session. Use of models makes the process of learning very simple. Slides should be used along with commentary. Synchronized slides with audio cassettes reduce the need of commentary by trainer. A good video cassette can be a very effective aid in learning. It should always be followed by a discussion. It should not be used as a filler for the speakers not turning up.

Overhead Projector (OHP)

The transparencies are projected on a screen and the OHP is used as a refined blackboard. Technically the reception by the trainees is better if the transparencies are prepared by keeping them in a horizonted position and some computer packages prepare them in that manner. However practically what happens is that it is projected outside the screen if the OHP is not set properly. Since setting of the OHP depends on the space available and beyond the control of the trainers the solution is to prepare transparencies by keeping them in a vertical position.

The portion of the transparency not to be screened should be covered by a piece of paper. The extra written material projected distracts the audience. Switch of the light when no transparency is being projected and also while changing transparencies. On projecting a transparency wait for a few seconds for the audience to read it before describing it. Do not read from the transparency by talk around it describing what is written. Do not write too many details. Remember it is an aid for the trainee and not the trainer. Notes written on the mounted transparency by pencil may be used as a guide to the trainer. Ability to maintain eye contact with the trainees is the advantage OHP has over blackboard and it should be used to the maximum. Don't turn your back towards the audience pointing towards the screen. The same may be done by using a pencil on the transparency and maintaining eye contact with the trainer.

Display – Only when required

Describe – What it represents

Teach – Using the aid to assist

Dispose – When no longer required

For a group of 20-25 trainers are

6 mm size of letters

6 words in a time

6 lines in a page

Last and most important—make and use your own aids.

3.9 EVALUATION OF TRAINING

Training is worthwhile only if it produces results. I think you will all agree with this statement. So let's see how we can measure results. The only problem is that different

people will view results differently. The trainee who undergoes training will consider the training worthwhile only if there is an improvement in his knowledge and skills and can perform his job better after training. The immediate officer of the trainee (supervisor) views the success of the training in terms of improved performance and output. The trainers evaluate the training in terms of the level of achievement of the objectives. The senior administrator (you) will like to know if the investment on training was worthwhile. In a business enterprise this is very easy to calculate. You invest three lakhs in the training of your marketing manager, sales executives and sales representatives. After an year you assess the increase in sales. If the sales go up by 1 lakh you know that the investment would break even in 3 years (we don't take the interest on investment for the ease of calculation) and then you will be gaining 1 lakh every year. Seemingly a worthwhile investment. How do you measure this in a hospital? The improvement will not be in terms of money but in terms of (a) improvement in the quality of services, (b) improvement in client satisfaction; (c) improvement in the reputation of the hospital. As an administrator you will have to develop yardsticks (indicators) to measure these and weigh the investment on training in relation to the indicators developed.

In any case this will be possible only if need based quality training is imparted. Assuming that the training needs were correctly assessed. Let's see how can we evaluate the quality of training imparted.

The purpose of training is to bring about an improvement in performance. In other words, a trainee after undergoing training should be able to perform his job better. Only when this happens can we call the training to be successful.

So how do we find out if the training is successful? The simplest method is by examining the performance of the health personnel i.e. how the trainee is performing. But there can be situations where the trainee is good and sincere with a willingness to learn. Yet there may be no improvement in performance. Well, what do you think could be the reason in such a case? Yes you have guessed it right. The training could be faulty and ineffective. In order to have a correct idea we should also examine the training process. So what we are actually doing is examining the trainer and his training course.

When we are assessing the progress and the performance of the trainee, it is called as "Assessment". When we are trying to find how well the trainer is doing (including the course he is running) it is known as evaluation.

Check Your Progress 3

Assessemnt is how well the ..... is doing.

Evaluation is how well the ..... is doing and how good is the .....

3.9.1 Assessment

As we have already discussed, the assessment is of the trainee. Now we'll make an attempt in defining it.

"Assessment is the testing and appraisal of trainees' performance or achievement, resulting from a training experience."

i) **Functions of Assessment**

We will now briefly discuss the functions served by the assessment of trainee.

By assessing the trainees we are able to inform the trainees how well they are progressing during the training. Immediate feedback to the trainers help them in finding their weakness and motivates them, improve their performance, it also keeps the trainees active. As we all know that the learning is maximum, when there is an intense trainee activity. It also helps in grading the trainees.

Assessment also informs the trainers of how well the trainees are progressing. This may give insight to trainers in how to provide remedial training to those trainees who are not doing too well. It also informs the trainers of how well the training itself is working.

Last and not the least (perhaps the most important) it helps in maintaining training standards.

ii) **Types of Assessment**

Visualize a shooting competition. Dozens of participants aim at the bull's eye and the one who scores the maximum gets the prize. One winner and all other losers. This doesn't seem to be a very happy situation in training. There is a lot of wastage. Can you suggest a better method of assessment? I think you have guessed it right. The car driving test. All the prospective drivers who achieve the basic minimum standards of driving are given a driving licence. Here we are aiming for a situation where everyone is a winner.

iii) **Norm-referenced Assessment**

When assessment is done for grading purposes, like in the shooting competition, where we are trying to select the best, it is known as Norm-Referenced Assessment. The performance of the trainees is compared with that of other trainees. The rank-ordering of trainees has priority over their actual competency and capability.

iv) **Criterion-referenced Assessment**

When we assess the trainee with reference to a criterion or a standard it is known as criterion-referenced assessment. The driving test was one such example. This kind of assessment is very useful in profession where the trainees have to achieve a desired level of competence at the job. This desired level of competence is laid by the administrator in collaboration with the trainer as the criterion. For example the anganwadi worker should be able to plot the weight of the child on the growth chart.

Criterion Referenced Assessment provides feedback to the trainer also. A large proportion of failures is an indication of poor training. Either the selection of trainees was faulty or the process of imparting the training was not satisfactory.

Check Your Progress 4

In which situation can we use Norm-referenced Assessment in training?

.....

.....

.....

3.9.2 Evaluation

Evaluation, as we have already discussed is of training and thereby the performance of the trainer. So we can say, "Evaluation is a system designed to value the effectiveness, efficiency, and effects of training and of the trainer". Trainee assessment is part of the system of evaluation. The other parts appraise the efficiency and effectiveness of the design system itself and the ways in which you use this system when implementing the training.

i) **Functions of Evaluation**

What are the functions of Evaluation?

Evaluation of training has several functions and is a very useful tool for the trainer. First of all it helps the trainer in judging the overall effectiveness of the training. It shows us the deficiencies both in the designing and the implementation of training. It also suggests the areas where we need to improve.

Evaluation also helps us in knowing how the training effected the learner i.e. to what extent did the trainee achieve the objectives of training. It also helps the trainer in making changes in the training course, whether it is in the form of providing remedial training to the trainees lagging behind or making changes in the objectives that are not being achieved. Evaluation also appraises the trainers of their effectiveness.

In broader terms evaluation helps in identifying the outcomes of training which can be used for grading and certificating the trainees. It also helps in valuing the training in terms of cost effectiveness.

ii) **Types of Evaluation**

There are two main types of evaluation, these are

- Formative Evaluation
- Summative Evaluation

Formative Evaluation takes place during the training and at the end of the training. It is concerned with modifying the form and process of training, whilst the training is happening and after it is completed.

Summative Evaluation as the name suggests sums up the result of a course, mostly after the training is finished and it has little effect on the structure and process of the training which has just taken place.

Formative evaluation is used to diagnose the weakness in and performance of the trainee and the faults in process of training. These are subsequently corrected or at least remedial efforts should be tried.

Summative evaluation confirms both the improvement in the trainee's performance and the training itself.

iii) **Methods of Evaluation**

In most of the university examinations the failure rate is at least 25% and may be as high as 40%. Training cannot afford failure rates of this magnitude. Our aim is that 80%-90% of the trainees achieve 80-90% of the required mastery.

In formative evaluation we want to find out those trainees who have not attained the requisite mastery and should be given remedial training.

We can also make the profile of the trainee's progress by using the tests which measure against the criteria of competence. This criterion of competence is laid in the specific objective.

Tests of this nature include:

- Criterion-referenced tests
- Pre-tests
- Post-tests
- Skills tests.

It is preferable, if the trainees are informed in the beginning of the course, about the role of the criterion tests are to perform in evaluation.

iv) **Informal Evaluation**

Informal evaluation also makes valuable contribution in formative evaluation. It is based on collecting information from the trainees by informal discussions. Summative evaluation is done to grade the trainees. Some of the trainees perform very well, some poorly and the majority are crowded in between. Generally it is done at the end of the training. The grading is normally done by norm referenced tests and final examinations. Sometimes grading is done by tests after each phase of training.

3.9.3 Assessment Tests

Suppose you are invited to attend the sectoral meeting of ICDS. In the continuing education being conducted for the anganwadis the topic was "Use of Growth Charts".

The objective of the session was:

"At the end of the session the anganwadis should be able to plot the weight of the child on the growth chart'.

The training methodology used was demonstration (without return demonstration). At the end of the session you request the medical officer to kindly assess the performance of the trainees to see, if the objective of the session has been achieved.

He asks the anganwadis the following questions:

1) Who devised the growth chart?

2) What is the role of immunization in the healthy growth of the child?

3) Name four vegetarian weaning foods.

How would you feel?

I am sure that you would be as disgusted as I am. The questions per se are correct and may be important but totally irrelevant as far as the present training is concerned. In fact not only the trainer but also the trainee do not come to know if the objective was achieved. The anganwadis would receive poor scores because they were asked what they were not taught. This will de-motivate them for further training.

So how do we evaluate the training? The answer is simple. "Test the trainees for what you have taught them". And what do we teach them "That what is stated in the objectives".

So the crux of the issue is that, if we are able to frame our objectives correctly the training and the evaluation simply follows them and becomes extremely simple.

How would you evaluate the anganwadi in the training session mentioned above?

The only way to know, if the anganwadi can plot the weight of the child on the growth chart is by observing her doing so.

We request the anganwadi to weigh a child accompanied by its mother and plot its weight on the growth chart. Then we observe the Anganwadi using a checklist.

For Example	**Yes**	**No**
1) Determines the age of the child correctly		
2) Adjusts the weighing balance to remove zero error		
3) Asks the child to stand in the right position		
4) Records the weight correctly		
5) Plots the weight on the growth of the child against the column of its age.		

If all the five steps have been done correctly then the anganwadi has fully achieved the objective.

Assessment in this manner gives confidence to the trainee, if she has achieved the objectives and a chance to improve her performance by learning from her mistakes if she hasn't.

Test Items

a) **Oral Question**

The oral question technique can be used to assess trainee achievement and the effectiveness of an instructor's presentation. The oral questions arouse interest, provoke thinking, checks understanding, discovers the trainee's weakness and evaluates how well the trainee has grasped the new concepts, ideas and facts. The questions should be short and the requisite answer should be specific.

b) **Essay Test Item**

All of us are familiar with essays. They can measure the complex learning outcomes, synthesis and organisation of ideas, analysis and criticism. The emphasis is on thinking and problem solving. Normally the essays are unstructured or openended. However, they may be structured where the trainer lays down some specific criteria.

The major drawbacks of essays are that they are time consuming with a low realiability and validity. Marking of essays is highly subjective.

c) **Two-option Alternate – Response Test Items**

The most common form for alternate response items is the statement to be judged true or false where-in the learner responds to a sentence length statement by indicating their truth or falsity. Agree-disagree items ask the participants to indicate whether they agree or disagree with statements that cannot be either true or false with certainty. Their items are used to measure attitudes.

Tips for Devising Two Option Questions

Limit each statement to a single idea. Do not use complex sentences, especially, ones that might contain both true and false elements.

Example

True/False — Theory X recognizes the interdependence of managers and employees, and Theory Y relies heavily on self-control and self-direction.

Doesn't it seem to be a bit confusing. Let us try to improve upon it.

True/False — Theory X recognizes the interdependence of managers and employees.

True/False — Theory Y relies heavily on self-control and self direction.

It is important to eliminate long, complex sentences. It is better to test for one single idea or fact.

d) **Multiple-Choice Test Items**

The most popular type of objective test item is that in which the trainee is required to choose one alternative response from a group of problems, questions or statements. The multiple choice item is considered the best type of objective testing method for measuring a variety of training objectives.

Anatomy of Multiple Choice Test Items

The parts that go together to make a multiple choice item are stem + alternative = item : for example,

Item — The instrument used to measure the blood pressure of the patient is known as

Alternatives
a) sphygmomanometer — Desired Answer
b) haemoglobinometer
c) potentiometer — Distractors
d) altometer

The desired answer to a multiple choice item should be:

i) the best possible answer

ii) independent of information given in other items on the test.

The distractors should be important, plausible choices rather than obviously wrong.

e) **Matching Test Items**

Matching exercises are not widely used. Matching items are most useful for measuring selection or recognition. In a matching exercise, the learner is presented with two lists, of such things as symbols, pictures, names, words, facts, phrases, numbers and principles. In a sense matching is series of interrelated multiple-choice items. It is the pairing of a term on one side with the term or terms on the other. In its simplest form, matching requires a series of multiple-option decision by the learner.

- *Pre Eclamsia*
- *Threatened Abortion*
- *Ante partum Haemorrhage*
- *Post partum Haemorrhage*

a) Oedema, diabetes & proteinurea
b) Oedema, hypertension & proteinurea
c) Bleeding during first trimester
d) Bleeding during second trimester
e) Bleeding during third trimester
f) Bleeding during second stage of labour
g) Bleeding during third stage of labour

f) **Completion or Fill in Items**

Alternate-response, multiple choice and matching test questions are selection or recognition types. In responding to completion or fill in questions, learners must recall, compute or otherwise create the answers. In the most popular completion type of question, the learner extends or adds to the test by writing words, phases, number or symbols in the spaces provided.

g) **Skill Performance Tests**

The trainee is required to demonstrate competence or mastery of a skill by practising the skill itself. Marks are awarded by the tester observing the process, which the trainee follows by using a checklist or by marking the finished product of the skill process or both.

Evaluatory Instruments

Assessment of the trainees inform us whether the objectives have been achieved or not. In other words, it tells us about the success of the course. But won't out information be incomplete if we do not know how the trainees felt? There may be situations when the trainer is satisfied by the progress of the trainees but the trainee feels that the course was not useful or even useless. The feedback given by the trainees can go a long way in improving the future courses. The simplest way of collecting this feedback is by asking direct questions mainly through questionnaires.

As an administrator you may be interested in knowing about the way the course was designed and implemented. You may also be interested in knowing about the different trainers. So you may like to develop evaluatory tools in the form of questionnaires. These tools should be simple to fill by the trainees and easy to mark. These should also simple to analyse.

3.9.4 Evaluation of Trainers

In order to save time lets come to a questionnaire directly.

a) **Trainer's Performance Questionnaire**

Please help me in judging my performance as a trainer by ticking the most appropriate number.

1-Poor, 2-Average, 3-Good, 4-V. Good, 5-Excellent

Name of Trainer_____ Topic_____

	1	2	3	4	5
1) Introduction of Topic was interesting					
2) Contents of the topic titled into the course					
3) The specific objectives were achieved					
4) Continuity of the topic was maintained					
5) Shows relevance of the topic to the job					
6) Contents were presented in a logical sequence					
7) Questions were stimulating					
8) Handling of student activity was effective					

9) Stimulates the trainees to think

10) Encourages trainee activity

11) Appropriate use of Audio-Visual aids

12) Voice was clear

13) Body language was appropriate

14) Was confident

15) Was interested in training

Analysis of the data can be done by making a master chart. Suppose the data given is the response of a trainer by five trainees for the first five questions is as follows.

	Trainee Response						
Question	**A**	**B**	**C**	**D**	**E**	**Total**	**Average**
1	2	1	3	2	1	9	1.8
2	3	3	3	2	2	13	2.6
3	1	1	1	1	2	6	1.2
4	5	5	4	4	5	23	4.6
5	3	3	3	2	3	14	2.8

The above findings suggest that the trainer's introduction to the topic was dull. The specific objectives were not achieved through the trainer had maintained the continuity of the topic.

As a course co-ordinator you may also use these responses to the trainer's sessions for comparing the quality of sessions of different trainers.

b) **Information Evaluation**

Questionnaires give information which can be compiled and used. However, informal discussions can tell us the feelings which the questionnaires can't.

c) **Steering Committee**

A committee comprising of 3-4 trainee volunteers is constituted. The members of the committee interact with other trainees informally during lunch and tea break and in the hostel and take their views about different aspects of the course. The views of the trainees is then compiled and given to the course co-ordinator. As the views of the coordinator are given by the trainees to their peers, they are very frank and straight forward and can be very useful.

d) **Trainee's Diaries**

The trainees are given a diary at the beginning of the course and are to write their views on it every day. Normally fifteen minutes are set aside for this towards the end of each day. The diaries are collected at the end of the course.

3.10 PREPARATION OF TRAINING PLAN FOR THE HOSPITAL

As an able administrator you always plan for the future. The same should be done about training of your staff. A well chalked out training plan for your employees may go a long way in the maintenance of standards in your hospital. It may be more productive and cost effective than the services you conduct in your hospital regularly.

The personnel department takes great pains in selecting the more talented employees for

the hospital. They will able to give their best performance if they are given induction training once they are appointed. This will enable them to perform their jobs as per the requirements of the hospital. I know that you will say that your staff learns what they are to perform in a few months. Yes, I agree but that is by trial and error. The grasping is further dependant on the personality of the employee and some achieve less than desired level of competence. Further, this period of a few months is very stressful. A well designed induction training will eliminate these few months of trial and error. Further, this will keep the new entrant more confident and motivated.

The introduction of any new technology should always be followed by training of the concerned staff.

You also plan about the career development of your employees. They are promoted and given new responsibilities. Whenever you are planning about the promotional avenues of your employees an element of promotional training should also be introduced.

Last and most important regular supervision and objective performance appraisal gives you insight about the employees who are not performing up to the desired level. They should be provided training preferably on the job. For the lower and middle level workers on-the-job training is perhaps the best form of training.

3.11 LET US SUM UP

Training is not a panacea for all ailments in the hospital but it definitely improves the performance of the employees. A carefully chalked out training plan over a period of few years improves the technical skills, inter-personal communication, behaviour, motivation and decision making abilities.

Training will be effective only if it is need based. Training need is the difference between the desired performance and the actual performance minus the managerial problems or non training intervention. The training needs are best identified by observing the employees and determining the gap between the desired and the actual performance. Other means of determining the training needs are by interviewing the employees, their peers, supervisors and sometimes their subordinates. Reviewing the performance appraisals and self-appraisals are also helpful as is the client satisfaction.

Once the training needs have been identified you as an administrator have to plan for the training. The training should be conducted applying the principles of adult learning wherein. The experiences of the learners is exploited to the maximum. The participation of the trainees should be high with a plenty of practice. Positive feedback should be provided helping them to correct themselves and improve their knowledge and skills. High motivational level should be maintained with low dependency on the trainer. Active learning by the trainees should be encouraged.

The training may be induction i.e. at the time of joining an organisation, placement i.e. at the time of posting an employee for a new job. Inservice training is imparted during their service with the aim of acquiring new knowledge and skills. On the job training is imparting training at the place of his work.

The training needs decide the objectives of the course which should be stated in behavioural terms which are measurable. The methodology selected for training should be participatory with less dependence on didactic teaching. Methods like lecture should be discouraged and those involving high level of trainee participation and their experiences like case method, role play, brainstorming and counseling should be encouraged. Further, the training should also utilize the audio-visual aids to the maximum as they facilitate the process of learning.

Evaluation of training should be given due emphasis wherein you should measure the improvement in the performance of the trainees in terms of knowledge and more important skills. The quality of the courses conducted should also be evaluated and modified according to the results and feedback. Further as an administrator you should also evaluate the cost-benefit ratio i.e. the benefit to the organisation in relation to the amount of money spent.

Last and not the least, perhaps the most important is that you should chalk out a short, medium and long-term training plan for the employees of the hospital.

3.12 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

The trainee will be able to autoclave syringes and needles in a pressure cooker.

Check Your Progress 2

There is no 'best' training method. The training method should be selected on the basis of the objective that has to be achieved. The training method is the means to facilitate learning.

Check Your Progress 3

Assessment is how well the trainee is doing. Evaluation is how well the trainer is doing and how good is the course.

Check Your Progress 4

We will be precise and explain to the trainer what are the needs of our trainees and the exact improvement expected in the participants after undergoing the training.

UNIT 4 COMMUNICATION

Structure

4.0 OBJECTIVES

After going through this unit, you should be able to:

- define this enabling instrument;
- learn about the types and means of communication;
- understand and evaluate the elements of communication and communication networks;
- identify barriers and bridges in communication; and
- list out Ten Commandments of good communication.

4.1 INTRODUCTION

In organisations, it is only through communication that all the important functions of information handling, instructing, directing, integrating and monitoring are carried out. In person-to-person relationships, mutual trust, understanding and cooperation can be achieved only with the help of meaningful communication. Interpersonal conflicts and misunderstandings arise where there is a lack of communication. Thus, it can be seen how important communication is in organisation as well as in social situation.

In the hospitals, most of the tasks are characterised by speed and accuracy. At times even a slight deviation from the predetermined plan could spell disaster. From this can be deduced the magnitude of information handling that would be required in the hospital set ups and the need for emphasis on communication.

If the study of communication is enlarged to provide a deep and insightful knowledge, it would include the entire gamut of psychological sub-disciplines like perception, cognition, linguistics, motivation etc. It would also extend into organisational areas such as structure, hierarchy authority and management functions. Of necessity, the present study will have to be limited in scope. The objective of the unit on communication is to create an understanding of the process of communication and how it is related to the structure of organisation, and to enable one to relate this knowledge to one's effective task performance.

4.2 WHAT IS COMMUNICATION?

Communication has been defined in numerous ways. The one chosen for the purpose of the present study is : 'Communication is a mutual exchange of facts, thoughts and perception, resulting in common understanding of all parties. This does not imply agreements.' An examination of this definition reveals the following ingredients as being important in communication:

- Communication is purpose oriented.
- It is a two-way process.
- Psycho-social aspects like thoughts, feelings, emotions are involved in communication.

Communication in organisations does not mean mere exchange of messages. It embraces a great deal more. The values, prejudices, feelings and personality factors of all the participants concerned come into play. Used appropriately, communication can be the most effective instrument for growth and development of organisations and their members. Its absence or inappropriate use can engender conflicts and problems.

Peter Drucker identifies four fundamentals of communication which show the nature of the process. These are briefly stated below:

- **Communication is Perception.** This implies that is only the recipient who communicates, because if he doesn't perceive what is transmitted no communication takes place.
- **Communication is Expectation.** People perceive only what they expect to. The unexpected is ignored or misunderstood.
- **Communication Makes Demands.** Experiments have shown that words with unpleasant emotional charges or threats tend to be suppressed while those with pleasant associations are retained longer. In other words, communication makes a demand on the recipient in terms of his emotional preference or rejection. It is also demands him to become somebody or do something.

Information is logic, format and impersonal, while communication is perception. The less tied up information is with human factors. The more valid and reliable it becomes.

4.3 TYPES OF COMMUNICATION

As said earlier, communication occurs in all social situations. It can also take place within a person. Communication is generally categorised into three types:

- **Organisational Communication.** Everyone is familiar with this type of communication. It is a work-a-day experience. It encompasses generation or collection of data, collation and dissemination of information, decision making and implementation, and management of conflict.
- **Interpersonal Communication.** It is one that takes place between two persons. It is characterised by active interaction. The quality of encounter and the relationship, that occurs between two people through such transaction determines the extent to which growth and development are enabled. Mutual trust, understanding and consideration grow out of positive transaction.
- **Intrapersonal Communication.** Human being are given to self-reflection and introspection. It is a kind of communication one holds with one's self. The psychologist CG Jung observed, 'Self is a product of intrapersonal communication or the behaviour that results from the dialogue between conscious experience and unconscious values.' The range and depth of a person's experience of the physical and abstract world around him, his self awareness, and concept of self are determined by the quality of intrapersonal communication. Further, it is the ability to become aware of one's self that helps one understand others. Thus intrapersonal communication indirectly influences interpersonal communication.

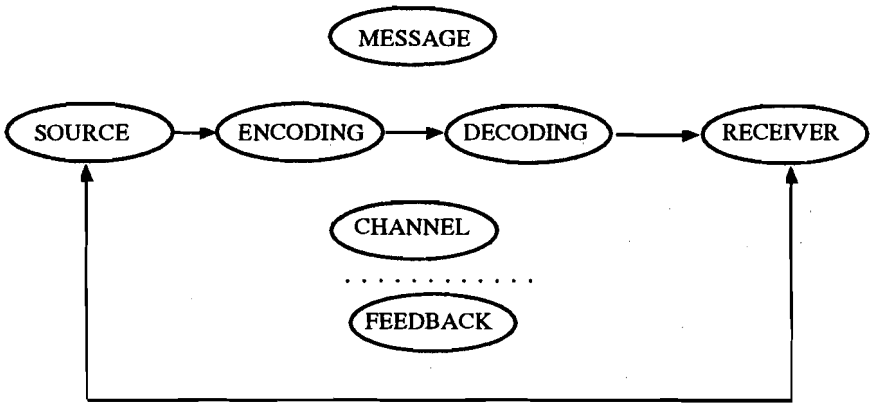
There are many means one can choose from to initiate and continue communication. It

could be verbal, non-verbal, vocal or non-vocal. The following matrix shows the various combinations and the resultant channels one can use for communicating :

	Vocal	Non-vocal
Verbal	Spoken Word	Written Word
Non-Verbal	Scream Grunt Inflection	Gesture Spatial Relationship Facial Expression

4.4 ELEMENTS OF COMMUNICATION

One of the simplified models of communication is shown below to illustrate the elements in the process of communication :



(. . . . . = NOISE)

Source: In an organisation situation the source is normally a person with ideas, intentions, information, and a purpose for communication. One of the prime responsibilities of the source is to ensure that the communication initiated is within the field of perception of the receiver.

Encoding: One of the prerequisites of communication is to establish a common base of understanding between sender and receiver. Encoding is a process which partially achieves this. It translates the conceptions of the source into symbols and forms.

Message: Is the 'Hardware' or the physical product of the source. The shape and form that message assumes are determined by the channel that would be used and the speed intended.

Channel: Channel of communication is the mode that is used for conveying the message from the source to the receiver. A message could be verbal, written, face-to-face, telephonic, mass-media etc. The appropriateness of channel selection contributes to effectiveness of communication.

Decoder & Receiver: Real communication takes place only when the recipient takes cognizance of what is emitted. The most important of the elements in the process is decoding the incoming message in terms of the receiver's past experience, expectations etc. Most problems in communication situations occur when there is incongruence between source encoder and decoder-receiver. In organisations this is one of the key areas for managerial attention for improving communication.

Feedback: The source or sender ought to know the impact of his message on the recipient. Firstly, he has to be assured that it has been received in full as intended and secondly he should know the message is understood and its contents have had the desired influence. This element, therefore, has to be inbuilt in the system of communication. Surprisingly, feedback system is not so common in organisations, particularly those with a rigid hierarchy.

The process of communication is susceptible to distortion, breakdown, or interference along any of the elements. There are numerous organisational and human causes which contribute to noise in communication situations.

4.5 VERBAL AND NON-VERBAL COMMUNICATION

A communication in which words are used can be called verbal communication. Communication over long distance takes place usually through verbal communication. As an adjunct to this is the non-verbal communication which refers to the use of body language in communicating ideas from the sender to the receiver. Non-verbal communication most often takes place unconsciously, and it may either supplement the verbal communication, or may at times negate the very purpose of verbal communication.

Let us examine each of these one by one.

The main characteristics of verbal communications are the use of words, either written or spoken.

Written communications include personal letters, memoranda, policy and procedure manuals and notices placed on the notice boards.

Examples of oral communication are conferences, committee meetings, telephone conversation, loudspeaker announcements, etc.

Both written and oral communications have their merits and demerits.

A written communication has the advantage of being easily verified and of being more precisely defined if there arises a need for subsequent correction. Spoken messages cannot always be verified so easily.

Secondly, because a written communication is likely to be a permanent record, we are more particular in making it precise and accurate.

Thirdly, lengthy and complicated messages are better understood if they are put in writing. It would be difficult to understand and retain a lengthy message if it were only in oral form.

Together with these advantages, written communications have some drawbacks also. Some of these are:

- Firstly, it is a slower method of communication if we considered the total amount of time involved from the formulation of idea by the sender to the understanding of the idea by the receiver. A written communication competes with all other written material that reaches the desk of an executive. As such there can be a gap between the time when a communication reaches the manager's desk and the time when he reads it. Moreover, if clarifications are needed because the message is not clear to the receiver, further delay would take place.
- Secondly, despite the fact that a greater degree of preciseness is aimed at while preparing a written communication, there is always a possibility of ambiguity or lack of clarity creeping in leading to misunderstanding on the part of the receiver. Clarifications naturally mean delay.
- Lastly, over-reliance on written communication can lead to too much of paper-work in the organisation. This not only consumes time, money and energy, but also indicates a lack of trust among the employees of the organisation. It has been observed that when trust is low and suspicions are high in an organisation, an over-reliance on written communication is likely to occur.

Oral Communication

Although an organisation cannot function without written communications of various kinds, yet by far the greater percentage of information is communicated orally. It has been observed that managers spend 60 to 80 percent of their work time in oral communication. Oral communication has the merit of being more rapid. Generally, the spoken word is quicker and less complicated way of getting one's ideas agrees another person. Again, it offers the potential of two-way information flow, and therefore less possibility of misunderstanding the communication. The creation of a less formal atmosphere and generation of fellow feelings are the additional advantages brought about through oral communication.

However, the oral communication is not entirely free from defects. It is less effective as a means of presenting complicated and lengthy data. It is also subject of misinterpretation and the effects of barriers arising from interpersonal relationships.

Can you determine which of the two, oral or written, is a better means of communication? You will see that the choice between the two is, generally speaking, determined by the situation. However, the use of both together will very often strengthen and reinforce a message.

Take your own case. The material in your hand is the written communication which will be fortified subsequently through oral communication in the contact classes or educational TV programmes. The two together, we hope, will further increase your understanding of the concepts and application of management.

Choosing Your Words

You have read earlier that communication refers to the transmission of meaning from the sender to the receiver. Such transmission takes place through the use of symbols, whether verbal or non-verbal. In verbal communication the symbol is a word. In order that the transmission of meaning takes place it is important that the particular symbol (word) used must create within the mind of the receiver the same image which was in the mind of the sender of the communication. It is only then that the basic purpose of communication which is to influence the behaviour of the receiver, will be achieved. It has been found that words do not necessarily have commonly understood meanings. The abstract words like 'participation' or 'democracy' suffer from difficulty that different people are likely to attach different meanings to these words. The greater the use of such abstract words, the bigger the difficulty in bringing about an understanding of the message and a change in behaviour through communication.

Keith Davis in his well known book 'Human Behaviour at Work : Organisational Behaviour', has suggested a few guidelines for making verbal communication more effective. These are:

- Use simple words and phrases.
- Use short and familiar words.
- Use personal pronouns (such as 'you') whenever appropriate.
- Give illustrations and examples.
- Use short sentences and paragraphs.
- Use active verbs such as in 'The manager plans'.
- Economise on adjectives.
- Express thoughts logically and in a direct way.
- Avoid unnecessary words.

Use of Body Language

In determining the effectiveness of communication, in the sense of effecting a change in behaviour, non-verbal communication has an important role to play. Experts in the field of human communication have found that, in a typical message between two persons, only about 7 percent of the meaning or content of the message is carried by the actual words being used. Another 38 percent of the message is carried by one's tone of voice (which includes pacing, tuning, pauses, accents). The major part of 55 percent of the content of the message is in non-verbal form, in other words, in the form of our physical attitude going along with our verbal message. The physical attitude is also referred to as body language.

Non-verbal communication can take place with our actions or with our body gestures. For example, a manager who pounds his fist on the table while announcing that from now on participative management will be practiced in his organisation creates a credibility gap between what he says and what he practices. A manager who says that he believes in an open door policy for all his employees but is busy with his own files while an employee is giving him certain suggestions towards improvement in work

environment, is making non-verbal communication quite in conflict with his verbal communication. In such situations the non-verbal message is the stronger one and the verbal message will cease to be effective.

Body gesture that 'communicate' may relate to your handshake, your smile, your eye-contact, your posture while standing or sitting, your facial expression while listening, the shrug of your shoulders, indeed, the movement of any part of your body. You must, therefore, be watchful of your body language so that it does not contradict your verbal message. This is indeed difficult because the body language is so involuntary that we are not even aware of it.

Some of the non-verbal actions, which assist communication, include:

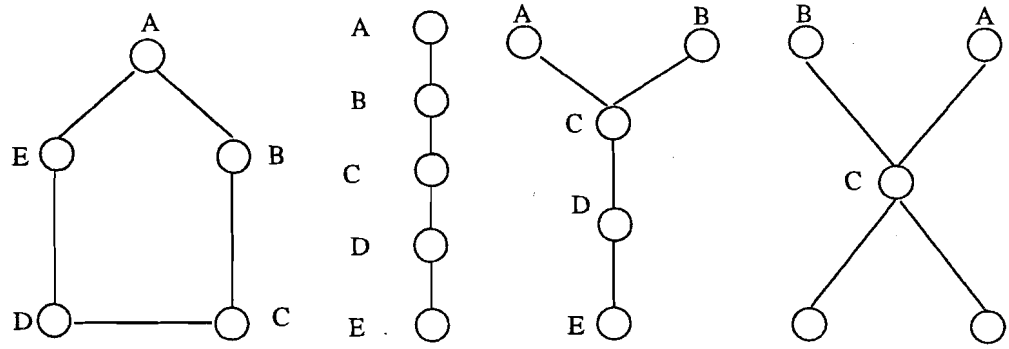
- Maintaining eye contact.
- Occasionally nodding the head in agreement.
- Smiling and showing animation.
- Leaning towards the speaker.
- Speaking at a moderate rate, in a quiet tone.

Some of the non-verbal action that impede the communication are :

- Looking away or turning away from the speaker.
- Sneering or using other contemptuous gesture.
- Closing your eyes.
- Using an unpleasant tone of voice.
- Speaking too slow or too fast.

4.6 COMMUNICATION NETWORKS

There are different patterns or networks of communication, each of which has its own characteristics. The structure of the network influences speed and accuracy of message handling, and performance and motivation of the participants. Some of the most common structures are shown below:



Around 1950, Leavitt and his group carried out experiments to evaluate the effectiveness of the different networks. For each position in every network, they worked out indices of centrality and peripherality. Network functioning and participants' behaviour were then related to these indices to arrive at a conceptual framework. Some of the findings of the researchers are :

- **Patterning:** The 'Wheel' was constant in its operation and peripheral positions sending information to the central point (C) which worked out answers and decisions. 'Y' operated so as to give the central position (C) complete decision making authority. Organisation in this took longer than wheel to evolve, but remained stable after evolving. In the 'Chain' information was sent from both ends to the central position (C). Organisation took longer than other two stabilise. The 'Circle' had no consistent operational organisation.

- **Message handling** was faster in Wheel than Circle. Circle used more messages than other to solve problems.
- Leaders emerged invariably in Wheel and "Y" but less frequently in Chain and Circle. In the Wheel, position (C) was always considered the leader.
- Only in the "Wheel" people were able to recognise the organisation.
- Enjoyment of participants of their jobs was in the order of — Circle, Chain, Y, Wheel, Circle being the most. Circle members sent more informational message and replies than members of any other pattern.
- The persons holding the central position and greater probability of becoming leader and also deriving job satisfaction.
- The Circle displayed remarkable ability to adapt to sudden changes and confused situations which others, particularly the Wheel, did not possess.

To summarise, the study revealed that the network affected the behaviour of participants in a communication situation. The aspects of behaviour observed were accuracy, total activity, member satisfaction. The position a person occupied in a pattern was found to influence satisfaction and leadership emergence.

Activity 1

Identify various types of communication networks that exist in your organisation, which is the most effective one and why.

4.7 COMMUNICATION : BARRIERS AND BRIDGES

The process of communication is very sensitive to distortions, which are easily caused by the human element involved in it. These distortions are the barriers to communication, and they can be encountered at any point between the source and the receiver. Any one of the numerous factors can set a read block to the flow of communication, causing ultimately total breakdown. The origin of most of the hospital maladies and inter-personal frictions can be traced to breakdown of communication.

The environmental conditions in the hospital services are such that a free flowing communication is very essential. The one most important binding factor in

organisational relationships in the hospital is human interaction, which cannot take place without effective communication. Any breakdown in communication could be costly, even disastrous.

4.7.1 Communication Barriers

While the number and type of barriers abound, they are being considered hereby grouping them on the basis of their relevance to various types of communication. Some of the barriers, common to all situations, will also be discussed.

- **Perceptual Problems:** Perception plays important role in communication, in that it determines how events are seen and interpreted, and what meanings are attached to symbols. However, both sender and receiver can induce distortions in communication through incorrect perception. Stereotyping, prejudice and selectivity are few of the common problems that cause distortion. There are many other similar problems related to perception that undermine effective communication.
- **Lack of Listening:** Although its effect is more pronounced in face-to-face interpersonal communication, lack of listening can be resent as a barrier in other situations also. Absence of motivation, preoccupation of mind, lack of interest and such like reasons can be attributed of poor listening on the part of the receiver.
- **Semantic Problem:** This is one of the most critical problems in communication. Words can be interpreted in different ways by different people because they denote a number of things and also carry certain connotations. Perception, frame of reference and individual experience are some of the factors that influence meanings of word. If the receiver does not perceive meanings of words in message as intended by the sender, communication breakdown can easily occur. Sarcasm, insinuations and indirect remarks, most frequently encountered barriers, fall under this category.
- **Premature Evaluation:** Most people have the tendency, in whatever type of communication they are participating, to start evaluating what they receive from the very beginning. They make certain conclusions prematurely, based on scanty data and their own frame of reference. Such premature judgement could cause the receiver to terminate receiving the message midway. At least he will be biased heavily during the reception of the rest of the message.
- The message content itself could turn into a barrier in certain situations. If what is being conveyed is too complex for the receiver he may show no interest and ignore the message completely. On the other hand, too simple an idea in a communication may also be dismissed by the receiver as unworthy and inconsequential.
- The status and credibility of the sender of the message also influence how the receiver perceives it. For instance, if the source of a particular communication is of dubious standing, or usually in the habit of amending its message frequently the receivers are likely to be negatively biased in their perception.
- **Observation *vs* Inference:** One of the most common problems in communication is the sender transmitting, not what he actually observes but, the inferences he makes from the observations and at the same time assumes that the receiver will be able to distinguish one from the other. Thus, information becomes subjective opinion whereas it should be objective fact. Decisions made on the basis of such information are bound to be 'influenced'.
- It is not within the ambit of this paper to go into the intricate aspect of Intra-Personal Communication and the related problems. However, the importance of intra-personal communication in personal growth and development needs no emphasis. Communication with one's self can be severely hampered by inhibition, limitation of vocabulary, or defensive mechanism pre-dominating.
- It is in organisational situations that one encounters numerous barriers and problems related to communication. These are contributed by the very structure, relationship and processes in an organization. Some of the frequently occurring barriers are examined here.

- **Chain of Command:** Following the traditional concepts of organisation and communication, many organisations insist on the flow of communication strictly following the hierarchy. Delay and distortions results from this constraint.
- **Information and Power:** Information is power in organisations. Even if a person has no position of consequence in the hierarchy, the fact that he has information which make him all too important. People, therefore, indulge in information hoarding and use it as a sort of a currency for 'Pyramid Climbing' or to make people dependent. Thus, communication channel can become dry of purposive information flow.
- **Staff-Screen:** An artificial screen can be created between the top management and those below by interested middlemen, or staff, to filter messages, specially those going upward. This can smoother the circular exchange of communication, and eventually cause organisational stagnation and impasse.
- **Distortions by Relay Points:** In serial communication, conveying of message through a number of intermediary stations, distortions in terms of omission, alteration and addition occur.
- **Specialisation:** When there is greater specialisation in an organisation communication is adversely affected.
- **Lateral Relations:** It is not uncommon to see a hesitation among colleagues to seek information from each other. This is mainly because of the fear that such an attempt to seek information would be considered as an indication of ignorance or lack of confidence.
- **Lack of Feedback:** Organisations generally do not cater for feedback mechanism in the structure of communication. As a result, the originators of communication often remain obvious to the impact of their message on others. Even though the importance of feedback in the cybernetic system is an established fact, it is not sufficiently put to use by organisations.
- **Interpersonal Problems:** It is in the area of interpersonal communication that, besides the various barriers discussed earlier, the people's problems have a significant effect on communication. Interpersonal communication is most sensitive to distortions, because the participants are face-to-face and exchange ideas and views, using multiple modes of communication, and thus making hidden message susceptible to detection. (For ease of categorising, inter-personal communication refers mostly to face-to-face.) Lack of mutual trust and sincerity restrict people from reaching out to each other. Relations can be impoverished when people indulge in deceitful transactions and meaningless rituals. The body language has something different in mind. This incongruence between vocalised message and that conveyed by body language can act as a powerful barrier. La k of awareness of self and others, the inability to see the other man's point of view and a deliberate avoidance of rear contact with other people are some of the reasons why interpersonal communication comes to grief abruptly.

Activity 5

Identify the communication barriers in your hospital/organisation which are affecting the effectiveness. What can you do to remove the barriers?

4.7.2 Communication Bridges

The numerous possible barriers to communication point up the magnitude of administrators' task in structuring and maintaining effective communication system in organisations. The effort involved in obviating, or overcoming the roadblocks is enormous indeed. The examination of various barriers itself has given a fairly clear idea as to what should be done to eliminate, or at least minimise the effect, the problem sources.

Following are some of the general hints for improving communication :

- Make notes where necessary.
- Give information in sequentially organised form.
- Do not take it for granted that the words and symbols are understood in a similar manner by all concerned.
- Make the distinction between observation and inference very clear.
- Simplify messages as far as possible.
- Slow down oral transmission.
- Use multi-media for sending message.
- Repeat message where necessary.
- Emphasise the important.
- Keep the link in the chain minimum.
- Make a preview and review for each message transmitted.

In order to improve the sending of message the source should take following measures:

- Analyse the characteristics of the receiver and evaluate competence for perceiving and understanding communication.
- Keep the receiver in mind throughout transmission.
- Be aware of the impact made on the receiver through a well established feedback system.
- Improve transmission skill through a conscious effort and constant practice.

Improving Receiving: The receiver has certain responsibilities in making communication effective and the guidelines for this element are given below :

- Adopt a positive attitude.
- Shut out distractions.
- Look for purpose in each message.
- Be alert to signals that pre-empt what is to come.
- Look for summary of what has gone before.
- Evaluate supporting materials.
- Look for non-verbal cues to perceive the message correctly.

4.8 TEN COMMANDMENTS OF GOOD COMMUNICATION

As a Hospital Administrator, your prime responsibility is to get things done through people. However, sound your ideas or well-reasoned your decisions, they become effective only as they are transmitted to others and therefore, is your most vital management tool. On the job you communicate not only with words but through your apparent attitudes and your actions. How well you manage depends upon how well you communicate in this broad sense. The ten commandments are designed to help

you improve your skills as a manager by improving your skills of communication – with superiors, subordinates, and associates.

- Seek to clarify your ideas before communicating. The more systematically we analyse the problem or idea to be communicated, the clearer it becomes. This is the first step toward effective communication. Many communications fail because of inadequate planning. Good planning must consider the goals and attitudes of those who will receive the communication and those who will be affected by it.
- Examine the true purpose of each communication. Before you communicate, ask yourself what you really want to accomplish with your message-obtain information, initiate action, change another person's attitude? Identify your most important goal and then adapt your language, tone, and total approach to serve that specific objective. Don't try to accomplish too much with each communication. The sharper the focus of your message the greater its chances of success.
- Consider the total physical and human setting whenever you communicate. Meaning and intent are conveyed by more than words alone. Many other factors influence the overall impact of a communication, and the administrator must be sensitive to the total setting in which he communicates, for example, the circumstances under which you make an announcement or render a decision; the physical setting–whether you communicate in private, or otherwise; the social climate that pervades in work relationships within the company or a department and sets the tone of its communications; custom and past practices—the degree to which your communication conforms to, or departs from, the expectations of your audience. Be constantly aware of the total setting in which you communicate. Like all living things, communication must be capable of adapting to its environment.
- Consult with others, where appropriate, in planning communications. Frequently it is desirable or necessary to seek the participation of others in planning a communication or developing the facts on which to base it. Such consultation often helps to lend additional insight and objectivity to your message.
- Be mindful, while you communicate, of the overtones as well as the basic content of your message. Your tone of voice, your expression, your apparent receptiveness to responses of others–all have tremendous impact on those you wish to reach.
- Take the opportunity, when it arises, to convey something of help or value to the receiver. Consideration of the other person's interests and needs–the habit of trying to look at things from his point of view will frequently open up opportunities to convey something of immediate benefit or long-range value to him.
- Follow up your communication. Our best efforts at communication may be wasted, and we may never know whether we have succeeded in expressing our true meaning and intent, if we do not follow up to see how well we have put our message across.
- Communicate for tomorrow as well as today. While communications may be aimed primarily at meeting the demands of an immediate situation, they must be planned with the past in mind if they are to maintain consistency in the receiver's view; but, most important of all, they must be consistent with long-range interests and goals.
- Be sure your actions support your communications. In the final analysis, the most persuasive kind of communication is not what you say but what you do.
- Last, but by no means least; seek not only to be understood but to understand be a good listener. When we start talking we often cease to listen-in that larger sense of being attuned to the other person's unspoken reactions and attitudes.

4.9 LET US SUM UP

Communication is the transfer of information from one person to another. Successful communication is much more than mere transfer of information–it is the transfer of meaning and understanding between two persons.

Communication has paved the way for modern civilisation and good communication is the foundation for sound management. No administrative activity is possible without communication of some kind, and the major part of an administrator's working time is devoted to communicating.

Communication is accomplished through a process in which the sender encodes an idea which is transmitted through a channel to a receiver who decodes the message and gains an understanding of the idea of the sender. The reverse process of feedback also follows the same pattern. During the entire process, interference is created by 'noise' which can lead to distortion of the communication.

Communication takes place either orally or in writing. It could be just one-way or two way, which allows the sender and receiver to interact with each other. A two-way communication is regarded better as it brings about understanding through clarity of the message. In an organisation communication may take place in several directions upward, downward, lateral and diagonal.

Words either written or oral convey a very small part of the communication : most of it is transmitted through non-verbal gestures. A manager ought to be careful lest his non-verbal gestures contradict his verbal message.

Communication within an organisation flows either through formally designed authority channels or through informal channels spontaneously formed and cutting across authority levels. Informal channels can have both positive and negative sides. Cluster chain network of informal communication permits a rapid flow of information through the formation of a grapevine. Formal communication is transmitted through several kinds of networks. The choice of a network will depend upon considerations of the complexity of a task, speed in decision-making in order to adapt to a change, and the satisfaction of members desired.

Interference in communication is caused by semantic, psychological and organisational barriers. In order to achieve effectiveness in communication, administrator consciously try to lower these barriers.

4.10 SELF-ASSESSMENT TEST

1) Write down the elements of Communication Process.

2) Identify 'noises' in the communication in your hospital.

3) Walk into your superiors doors and communicate with him on some issue and note the non-verbal clues and come to your office and record them.

4) You have received a telephonic message that one of your doctors have been hurt in a road traffic accident and requires urgent evacuation to your hospital. What are channel/methods of communication in this situation?

5) There is an acute shortage of a particular antibiotics in your hospital. What are channel you will use to reach all concerned at the earliest?

6) Your hospital has to participate in 'Pulse Polio Programme'. What are all action as Hospital Administrator you will take to achieve maximum success?

UNIT 1 MOTIVATION

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- define motivation;
- list the important motives influencing employee behaviour;
- explain and compare the major content theories of work motivation;
- discuss the importance of theory "Y" in the present hospitals; and
- describe the job enrichment approach of job design as an applied area of work motivation.

1.1 INTRODUCTION

In the present unit, we would begin by discussing the concept and basic process of motivation and theoretical approaches to work motivation would be explained. And in the end, we would turn our attention to the application of these ideas to work setting by discussing the applied aspects of motivation by examining job design and job enrichment.

Today the most important question troubling any manager or hospital administrator is 'How do you get employees to work to achieve organisational goals?' The answer rests in an understanding of what motivation is all about, for it is motivated workers who ultimately get things done, and without them no organisation can hope to be effective.

The Hospital administrator must be accomplished at planning and organising human and material resources, but unless employees work to achieve hospital goals, success will be elusive. The work of the administrator will be fruitless unless the various employees of

their hospital willingly contribute their efforts to the achievement of common objectives. Therefore, the primary function of the administrator is to induce voluntary co-operation on the part of their subordinates and associates. It follows from this that the most important qualification of an administrator is (i) an understanding of why employees are willing to contribute their efforts and (ii) skill in obtaining co-operation from the members of an organisation in working towards planned objectives.

1.2 CONCEPT AND DEFINITION OF MOTIVATION

Why do people behave as they do? How to make people work more or work better? How does one person obtain the cooperation of others? The major ingredient in answering all these questions is motivation. The first step in understanding motivation is to realise that it is a means of understanding the way people behave in organisations. In other words, these are 'Whys' of behaviour, the concept of motivation is both simple and complex. It is simple because behaviour of individuals is goal directed and either externally or internally induced. It is complex because the mechanism that induces behaviour consists of the individual's needs, wants and desires and these are shaped, affected, and satisfied in different ways. The hospital administrator must have mastery over the concept of motivation and be able to identify employee's drives and needs so as to fully understand human behaviour and to channel the behaviour towards task performance.

Why does one employee work harder than another? Why is one employee more cooperative than the other? The answer to these questions can be traced to the fact that every individual has needs to satisfy and will act in certain ways in order to achieve satisfaction. In simple words, we can say that our needs cause us to undertake a pattern of behaviour. We can define motivation as a "process that starts with a physiological or psychological deficiency or need that activates behaviour or a drive that is aimed at a goal or incentive". In more simpler terms, motivation is defined as "self or extremely induced behaviour that occurs in order to bring about or maintain need fulfilment." Thus, the key to understanding the process of motivation lies in the meaning of, and relationship between, needs drives, and goals. Using this understanding, we can design a simple model of motivation process (see Fig. 1.1).

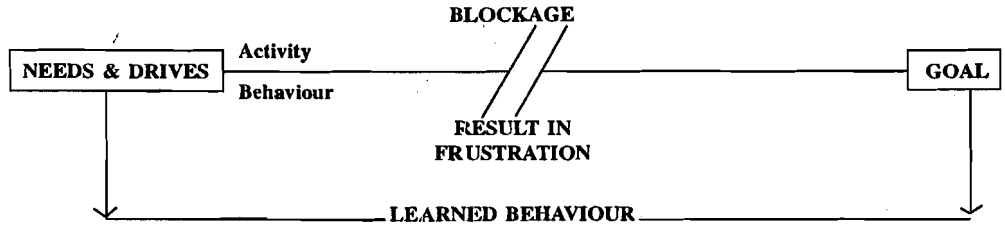

Fig. 1.1: Motivation Model

When we recognise behaviour patterns that enable us to satisfy our needs, we repeat these patterns until they no longer contribute to need fulfilment. If we have a need for praise and recognition from our immediate supervisor, the likely behaviour pattern would be exceptional job performance. If praise and recognition occur, we can assume that continued performance will result in more praise. This learned behaviour pattern is presented as the lower loop in Fig.1.1. But this motivational process explains the behaviour of individuals conceptually. Just imagine what would happen if you are blocked from fulfilling your needs? Or what happens if you work extremely hard, putting your best efforts and there are no rewards, and your needs are not fulfilled?

This phenomenon of behaviour at times cannot be explained rationally. When a behaviour pattern perceived as leading to need fulfillment is blocked, we often behave and react irrationally.

It is very important for the administrator/manager to recognise and understand what kind of behaviour this frustration generates as this would affect subordinate's behaviour, e.g. frustration may occur when an employee has a strong need for esteem and recognition but the job is not providing it or when an employee who is turned down

for promotion because he/she lacks the requisite training for the new job. One form of behaviour, we often see in our organisations is absenteeism, questioning one's abilities, negativism or self-termination (quitting). Their reactions to frustrations are not selected consciously by us but are a product of unconscious learning. These unconscious reactions to the tension created by frustration are called defense mechanisms.

The following are some of the most common defense mechanisms that the manager must understand and recognise:

Withdrawal: Some people react by withdrawing from frustration situations resulting in physically leaving the scene.

Repression: Some times a person may react by repressing the frustrating situation. This leads to losing conscious awareness which minimises the frustration that would otherwise result.

Displacement: Some times it is not possible to react aggressively towards the person who has caused the frustration (e.g. toward the boss), in such situations the aggression is directed towards another person — a colleague, subordinate, spouse or child or even some object.

Regression: Some times, in an attempt to avoid an unpleasant reality, some people revert to child like behaviour exhibited as horseplay in the work setting.

Compensation: Some times an employee would attempt to excel in one area of ability to offset deficiencies in another area.

Rationalisation: Often people are able to conduce themselves that the reasons for not fulfiling a need lie somewhere else e.g. a medical technologist may explain poor laboratory work by blaming obsolete equipment rather than some personal deficiency.

Fixation: Fixation takes place when a person continue to exhibit the same behavioural pattern over and over again despite the fact that experience has shown such behaviour to be ineffective. In such cases frustration freezes old habitual responses and prevents the use of new and more effective ones.

1.3 MOTIVES RELATED TO EMPLOYEE BEHAVIOUR IN ORGANISATION

Broadly three kinds of motives are identified such as: Primary Motives, General Motives and Secondary Motives. The secondary motives which are the motives related to employee behaviour in organisation would be the main focus of discussion in this section, but first let us understand the first two motives briefly.

1.3.1 Primary Motives

Such motives are also called physiological, biological, unlearned. For a motive to be included in the primary classification, two criteria need to be met i.e. it must be unlearned and it must be physiologically based. Thus the most commonly recognised primary motives include hunger, thirst, sleep, avoidance of pain, sex and maternal concern. Since people have the basic physiological makeup, they all have essentially the same primary needs. This is very unlike the learned secondary motives.

1.3.2 General Motives

There are a number of motives which lie in the gray area between the primary and secondary classification. To be included in this general category, a motive must be unlearned but not physiologically based. While the primary motives seek to reduce the tension or stimulation, these general needs induce the person to increase the amount of stimulation. The motives of curiosity, manipulation, activity and affection seem to meet the criteria for this classification of general motives. An understanding of these general motives is very important and relevant to organisational behaviour than are primary motives.

1.3.3 Secondary Motives

These are the most important motives which are related to employee behaviour in organisations. The learning principle of reinforcement is conceptually and practically related to the secondary motives. A motive must be learned in order to be included in the secondary classification of motives. Number of important motives meet this criterion but the ones which influence the employee behaviour in any organisation merit a discussion in this category. Some of the more important ones are **achievements, affiliation, power** or as they are commonly referred as **n Ach, n aff**, and **n power**. In addition to this, the **competence** motive, as an important factor in current attempts to attain high quality services/care are also included along with **security** and **status** motives in reference to organisational behaviour. Table 1.1 gives examples of each of these important secondary motives.

i) **The Achievement Motive**

The achievement motive can be expressed as a desire to perform in terms of a standard of excellence or to be successful in competitive situations. This kind of motivation is a drive, some people have to overcome challenges and obstacles in the pursuit of goals. An employee with this drive wishes to develop and grow, and advance up the ladder of success. For such people accomplishment is important for its own sake, not for the rewards that accompanies it. A number of characteristics explain these achievement-oriented employees. They work harder when they know that they will receive personal credit for their efforts, when they receive positive feedback about their past performance, and when there is moderate risk of failure in the work situation. Once these high achievers select a goal, they tend to be totally preoccupied with the task until it is successfully completed. They can never leave a job half finished and are not satisfied with themselves until they have put their maximum efforts.

ii) **The Affiliation Motivation**

This type of motivation is a drive to relate the people on a social basis. While employees with achievement-oriented motives work harder when their supervisor provides a detailed evaluation of their work behaviour, the employees with affiliation motives work better when they are complemented for their favourable attitudes and cooperation. Achievement motivated managers select subordinates who are technically capable, with little regard for personal feelings about them; but the ones with affiliation motivation tend to select friends to surround them as they get inner satisfaction from being with friends, and they also desire the job freedom to develop these relationships.

iii) **The Power Motivation**

This particular motive is a drive to influence employees and to change situations. Power motivated people wish to create an impact on their organisations and willing to take risks to do so. Once this power is obtained, it may be used either constructively or destructively. If their drives are for institutional power rather than personal power than such managers are very beneficial for organisations because as these managers seek power through legitimate means, they rise to leadership positions through successful performance and are easily accepted by others. This institutional power is the need to influence other's behaviour for the welfare of the whole organisation.

iv) **The Competence Motivation**

Another motive leading to organisational success is the competence drive to do high quality work. The very nature of hospital work requires this kind of motive in its doctors and administrators/managers to achieve high quality of services and patient care. Competence motivated employees seek job mastery, develop problem-solving skills and strive to be innovative. These individuals perform good work to achieve inner satisfaction and to gain esteem from others. Competence motivated doctors also expect high-quality work from their associates and become impatient if others perform poorly.

v) The Security Motivation

In today's fast-paced, highly technological society, security is a very intense motive. Job security, in particular has a great effect on organisational behaviour. On the surface, security appears to be much simpler then other secondary motives, for it is based largely on fear and is avoidance oriented. To sum-up, people have a learned security motive to protect themselves from the contingencies of life and actively try to avoid situations which would prevent them from satisfying their primary, general and secondary motives.

vi) The Status Motivation

This kind of a motive is basically a desire to be respected and treated with deference especially by others in the social and organisational environment. People high on this motive would hesitate to violate social norms and would do so only when they get the desired recognition positively. They run for offices, like to show authoritarian tendencies while working with others. They would also categorise people into status groups and interact with others selectively.

Table 1.1: Examples of Key Motives Influencing Employee Behaviour in Hospitals

Need for Achievement • A concern for excellence. • Doing better than competitors. • Setting and attaining difficult goals. • Solving a complex problem. • Carrying out a challenging assignment successfully. • Developing a better way to carry out jobs. • Derive pleasure from doing difficult things.	***Need for Competence*** • A drive to do high quality work. • Seek job mastery and strive to be innovative. • Develop problem-solving skills. • Gain inner satisfaction by performing high quality work.
Need for Affiliation • Establishing warm and affectionate relations with others. • Being accepted and liked by many people. • Enjoy working with friendly people. • Maintain harmonious relationships and avoid conflicts. • Participate and organise social activities.	***Need for Security*** • Wish to have a secure job. • To be sure of one's economic security. • Having protection against illness and disability. • Avoiding tasks or decisions involving risk of failure.
Need for Power • Influencing people to change their attitude and behaviour. • Gaining control over other people and their activities. • Enjoy being in a position of authority over others. • Argumentative and always wanting to be first. • Gaining control over information and resources.	***Need for Status*** • A desire to be respected and to be treated with deference. • Like to have a right car and right cloths. • Like to run for offices and positions. • Like to show authoritarian tendencies while working with others. • Categorise other people into status groups.

The knowledge and relation of these above key motives, influencing employee behaviour, can certainly help the hospital administrator/manager to understand the work attitudes of each employee. They can learn to deal with employees differently according to the strongest and dominant motivational drive in each. For example, an employee with high achievement motive can be assigned a job, accompanied by an explanation of its challenges. And the employee with high competence motive can be assigned a similar job with emphasis on its requirements for high-quality work. In this way the manager attempts to communicate with each employee according to that particular person's need.

Activity 1

Motivation—Self-Test

Please complete this self-test before you proceed further.

A number of activities are presented below. You may like some of these and you may not like others. Please go through each item and mark those activities in which you like to be involved.

1) Setting difficult goals for myself
2) Competing with other colleagues for better performance
3) Doing something difficult to prove that I can do it
4) Doing things that would help me stand out uniquely
5) Taking up things with determination and working towards accomplishing them
6) Meeting a lot of people
7) Joining a social club or group
8) Inviting people home for tea-parties and get-togethers
9) Having a lot of friends
10) Attending parties and social activities
11) Getting what I deserve even if I have to fight for it
12) Doing something that might provoke criticism
13) Arguing with a superior or subordinate
14) Teasing some one who is conceited
15) Annoying people I don't like
16) Helping someone in trouble even if I have to go out of my way
17) Taking personal care of workers and their problems
18) Fighting for national goals
19) Sacrificing things for the sake of others
20) Consoling someone who is disturbed
21) Doing tasks my superiors ask me to do
22) Pleasing my superiors
23) Observing the rules and regulations outlined for me very strictly
24) Checking things with superiors before I make decisions
25) Consulting people for most of the decisions
26) Having workers who do whatever I ask them to do
27) Getting people to accept my point of view
28) Framing rules and regulations
29) Demonstrating my knowledge and sharing it with others
30) Controlling workers through various techniques

Directions for scoring and interpretations of your responses to this self-test are provided later in this Unit.

Analysis of (Motivation) Self-Test

In the self-test you took at the beginning of this unit (Activity), six motives were included: achievement, power, affiliation, dependence, extension and aggression. Each group of five items measures one motive. The first five items (1 to 5) deal with

achievement, the next five items (6 to 10) with affiliation, followed by aggression (items 11 to 15), extension (items 16 to 20), dependence (items 21 to 25) and control (items 26 to 30). The number of items you checked out of five gives your score on that motive. For example, if you have checked all the items from 1 to 5 you get a score of 5 indicating that you have a high achievement need. If you have checked only one or two items, then you get scores of 1 or 2, indicating a low level of achievement need. Similar interpretations may be given to other motives. You may like to plot your motive profile below on the basis of your self-test.

Your Motive Profile

		Achievement (items 1-5)	Affiliation (items 6-10)	Extension (items 11-15)	Dependency (items 16-20)	Control (items 21-25)	Aggression (items 26-30)
Very high	5	—	—	—	—	—	—
High	4	—	—	—	—	—	—
Moderate	3	—	—	—	—	—	—
Low	2	—	—	—	—	—	—
Very low	1	—	—	—	—	—	—

Interpret Your Motive Profile

You may like to reflect upon the implications of this motive profile for you as a manager. A few comments are made below to help you reflect on your motive profile.

High scores on Achievement and Extension are desirable for your own effectiveness and the good of your organisation. A high score on extension is a welcome thing if you are in any service department or your work involves serving others. The achievement motive is good if you are a manager or executive.

A moderate degree of affiliation may be good but too much of it may indicate your tendency to value relationships more than tasks or work.

A high dependency need or control need may be indicative of your preference for rules, regulations and control. These can have both positive and negative effects. You may reflect on these.

Your scores on the self-test are only crude indicators of your motives. The self-test was meant to be used as a stimulant for your reflection and understanding about human motivation. You are not to take the scores as conclusive. Motives are complex and cannot be measured accurately with short instruments like the self-test given earlier. The test is meant only to give you a feel of how different motives operate.

1.4 THEORIES OF MOTIVATION

So far we have discussed motivation as a basic psychological process which consists of several motives, needs and drives and for an administrator to understand employee behaviour, the secondary motives have been highlighted here. But however, they serve as only background and foundation for the more directly relevant work-motivation approaches. This section would deliberate upon the theories of motivation based upon work-motivation approaches mainly. These theories are divided into two broad categories i.e. **Content Theories and Process Theories.**

Presently these two groups of content and process theories have be
explanation for work-motivation. Fig.1.2 mentions the the
content and process theories related to work moti

Content Theories identify specifically
environment, that initiates, su
process theories exp
theories def
int

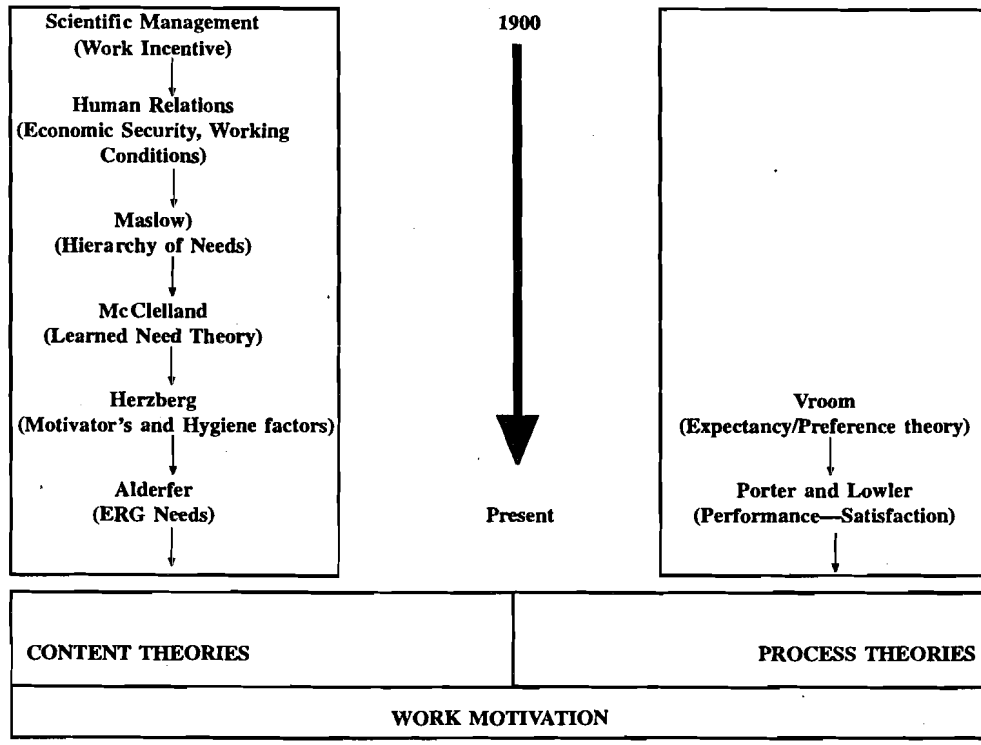

Fig. 1.2: Theoretical Development of Work Motivation

1.4.1 Content Theories of Work Motivation

The content theories of work motivation attempts to determine what it is that motivates people at work by identifying the needs/drives that people have and how these needs/drives are prioritised. These theories focus on the type of incentives/goals that people strive to attain in order to perform well and gain satisfaction. Earlier it was believed that money was the only incentive (**Scientific Management**), but a little later other scientists came up with the conclusions that incentives include working conditions, security and may be a democratic style of supervision (**Human Relations**). But significantly in the recent times the content of motivation has focused on the so-called "Higher Level" needs/motives, such as esteem and self-actualisation (**Maslow**); responsibility, recognition, achievement and advancement (**Herzberg**); and the growth and personal development (**Alderfer**).

1) Maslow's Hierarchy of Needs

In the earlier part of this chapter we have examined the important primary, general and more particularly the secondary needs of people, but without relating them to any theoretical framework. Abraham H. Maslow, a psychologist formulated one of the most widely known content theories of motivation called the Need Hierarchy. First published in the early 1940' the theory stressed two fundamental premises. The first is that humans are wanting animals whose needs depend upon what they already have. Only needs not yet satisfied can influence behaviour; an adequately fulfilled need is not a motivator. The second premise is that people's needs are arranged in a hierarchy of importance. Once a particular need is fulfilled, another emerges and demands fulfilment. Fig.1.3 illustrates the Maslow's need hierarchy. Maslow identified five levels in his need hierarchy, which are briefly explained here:

i) **Physiological Needs:** The most fundamental of all needs are physiological needs, which generally correspond to the unlearned primary needs discussed earlier. Some common examples are hunger, thirst, sleep, sex, rest etc. A person deprived of every thing would want to satisfy these basic needs first. Other needs in the hierarchy would be, at least for the moment, of secondary importance. Once these basic needs are satisfied, they no longer motivate.

ii) **Safety and Security Needs:** Once the physiological needs are basically satisfied, safety needs replace them. First there is the need for survival and second is the need

for the security and this need has both physical and psychological/emotional dimensions. Once these needs are satisfied, they no longer motivate.

iii) **Affection and Social Activity Needs:** When physiological and safety needs are basically satisfied, this third level needs related to the social and gregarious nature of people become important motivators. This is something of a breaking point in the hierarchy in that it begins to get away from the physical or quasi-physical needs of the first two levels. They are seen in people's need for association or companionship, belonging to groups and for giving and receiving friendship and affections.

iv) **Esteem and Status Needs:** This esteem need is much more psychological in nature than the first three needs and these represent the higher needs for people. The needs for power, achievement and status can be considered part of this level. Maslow carefully pointed out that this esteem level represents both self-esteem and esteem from others.

v) **Self-Actualization Needs:** This highest level of human needs represents the culmination of all the lower, middle and higher needs of humans. This need includes achieving full development of one's potential. It is evidenced by the need to be creative and have the opportunity for self-expression.

Interpreting the Hierarchy of Needs with Work Motivation

It can be interpreted from Maslow's need-hierarchy model that employees are more enthusiastically motivated by what they are seeking than by what they already have. Though Maslow did not intend that his need hierarchy be directly applied to work motivation and in fact did not delve into the motivating aspects of humans in organisations, the Maslow hierarchy of needs has had a powerful impact on contemporary managers by making a significant contribution in terms of making management aware of the diverse needs of employees at work and offers some useful tips for helping managers think about motivating their employees. If Maslow's

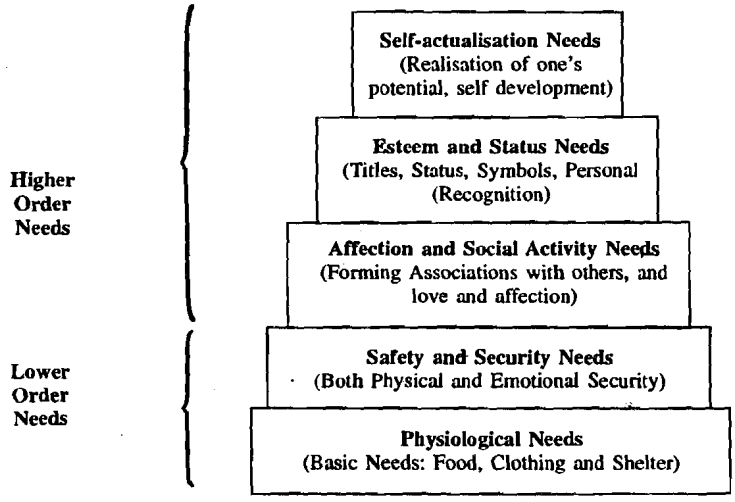

Fig. 1.3: Maslow's Hierarchy of Needs (Work Motivation)

estimates are applied to an organisation, e.g. the lower level needs of personnel would be generally satisfied (85% of the basic needs and 70% of the security needs), but only 50% of the social needs and 40% of the esteem needs, and a mere 10% of the self actualisation needs would be met. But despite these interpretations, the Maslow model has many limitations and unfortunately, the limited research lends little empirical support to the theory.

2) Learned Need Theory

Another content theory, not unlike Maslow's has been developed by McClelland. In it, the concept of needs is more focused. He argues that people are motivated by only three types of needs: Achievement, Power and Affiliation or as they are commonly referred: **n Ach, n Pow,** and **n Aff**. More importantly McClelland argues that these needs and the behaviours associated with the efforts to satisfy them can be learned.

For example, one who wishes to develop drive for achievement should strive to attain feedback from colleagues, seek models of achievement to emulate, and modify self-image by emulating some one who needs success and challenge.

3) Herzberg's Two Factor Theory of Motivation

In 1959 Herzberg extended the work of Maslow and developed a specific content theory of work motivation which was a direct result of research conducted by him and his associate on job satisfaction and productivity among 200 accountants and engineers. Each subject was asked to think of a time when he or she felt especially good about his or her job and a time when he or she felt particularly bad about the job and to describe the conditions that led to their feelings. The researchers found that the employees named different types of conditions for good and bad feelings. This led Herzberg to the conclusion that, motivation consists of two separate independent dimensions: Hygiene or maintenance (see Table 1.2).

Hygiene or Maintenance Dimension (Dissatisfiers)

Absence of some job condition can serve to dissatisfy employees. However, presence of these same conditions does not essentially lead to high degree of motivation. Herzberg called them maintenance or hygiene factors, since they are necessary to maintain a reasonable level of satisfaction. He also noted that many of these factors have been perceived by managers to be motivators, but that they are actually more potent as dissatisfiers (demotivators) when absent. He concluded that there were ten maintenance/hygiene factors (see Table 1.2).

Motivational Dimension (Satisfiers)

There are other job conditions that, if present, tend to build high levels of motivation and job satisfaction. However, if these conditions are not present, it does not prove to be highly dissatisfying. But he believed that these factors caused enhanced job performance. Herzberg described six of these factors as motivational factors or satisfiers (see Table 1.2).

Table 1.2: Herzberg's Classification of Maintenance and Motivational Factors

Maintenance/Hygiene Factors (Dissatisfiers)	Motivational Factors (Satisfiers)
1) Organisational Policy and Administration	1) Achievement
2) Technical Supervision	2) Recognition
3) Interpersonal Relations with Supervisors	3) Advancement
4) Interpersonal Relations with Peers	4) The work itself
5) Interpersonal Relations with Subordinates	5) The possibility of growth
6) Salary	6) Responsibility
7) Job Security	
8) Personal Life	
9) Working Conditions	
10) Status	

If we compare the Maslow and Herzberg models, it can be seen that they both emphasise the same set of relationships. Both are content theories; they look at what motivates human behaviour. Maslow looked at the human needs of the individual while Herzberg focussed on how job conditions affect the individual's basic needs. The main advantage of Herzberg's theory of motivation over the Maslow model of need priority is that Herzberg's theory shows the distribution between maintenance and motivational factors and, most importantly for the application of motivation theory in the work place, Herzberg shows that motivation tends to be derived from the work itself. He also draw attention to the importance of job content factors in work motivation, the job design technique of job enrichment is also one of Herzberg's contributions.

4) Alderfer's ERG Theory

Building upon earlier need models and especially the Maslow's and seeking to

overcome some of their weaknesses, Clayton Alderfer proposed a modified need hierarchy with just three levels. Like Malsow and Herzberg he also felt the need to categorise needs by making a basic distinction between lower order needs and higher order needs.

Alderfer identified three groups of core needs: **existence, relatedness,** and **growth**, also called as ERG Theory.

i) **The Existence Needs:** He suggested that employees are initially interested in satisfying their existence needs, which combine physiological and security factors and concerned with basic survival. Salary, Physical working conditions, Job security address with need.

ii) **The Relatedness Needs:** The needs are at the next level and these involve being understood and accepted by people above, below, and around the employees at work and outside. These needs basically stress the importance of interpersonal and social relationships.

iii) **The Growth Needs:** These needs at the third category involve both the desire for self-esteem and self-actualisation and are concerned with the individual's intrinsic desire for personal development.

Alderfer's ERG Theory suggests more of a continuous of needs than hierarchical levels or two factors needs. Unlike Maslow and Herzberg, he does not contend that a lower-level need has to be fulfilled before a higher-level need is motivating or that deprivation is the only way to activate a need.

1.4.2 The Process Theories of Work Motivation

The content theories discussed above attempted to identify **what** motivates employees at work (e.g., responsibility, recognition, achievement, self-actualisation and growth), the process theories explain **how** behaviour is initiated. We shall examine here two that are based on the theory of expectancy, which proposes what will generally be high performers if they believe (expect) that there is a good chance high performance will result in certain preferred outcomes, usually more positive outcomes such as rewards rather than negative outcomes.

1) Vroom's Expectancy Theory of Motivation

Victor H. Vroom developed a preference expectancy theory suggesting that motivation is a product of **expectancy** (what one thinks will result from certain actions) and **preference** (what one would like to have resulted from certain actions or behaviour). The preference-expectancy theory is more an explanation of the motivation phenomenon than a description of what motivates (as in the content theories we have discussed earlier). Vroom's theory explains how preference and expectation variables determine motivation.

Preference: In Vroom's Model, preference refers to outcomes an individual might experience as the result of certain behaviour. For example, a doctor in a hospital who operates upon more patients than others may receive higher pay and a promotion, or may impress upon the seniors and make his colleagues jealous. Many other outcomes are possible, including the possibility that nothing will happen. However, this doctor clearly has a preference.

Expectancy: The other part of the Vroom model is the individual's expectation that certain behaviour will produce a desired outcome. A person with a preference for an outcome must feel it can be achieved by doing certain things. Vroom's model's importance lies in its emphasis that motivation is individualistic and is dependent on the person having a specific preference coupled with a belief or expectation that certain activities or behaviour will bring about this outcome.

2) The Porter and Lower Model

The second important process theory based on expectancy theory has been developed by Porter and Lower. According to this theory, people are motivated by future expectations that are based on previously learned experiences. This theory suggests that

performance cause satisfaction. This contrasts with the view held by other experts that satisfaction courses performance.

Activity 2

Some descriptions of the behaviour of some individuals are presented in column 1 below. Column 2 lists the possible motives that are indicated by the behaviours in column 1. Enter the correct motive level from column 2 against each set of behaviours in column 1.

Behaviour descriptions	Motives
1	2
1) Mr. M involves himself in very few activities. Whatever he does, he does it exceedingly well. He is always the first to arrive at the office. As a school boy also he always strived to be first. (Motive is_____).	a) Aggression
2) Mr. N likes friends. Whenever he has time he likes to visit friends. In the office he has a group of people round him during lunch hours and tea breaks. It is rare to see him alone while coming to or leaving the office. He is always with someone. (Motive is _____).	b) Security
3) Mr. O is a fighter. There is hardly any one in the office who has not been hurt by his comments. Sometimes in the villages he has visited, he has been involved in physical fights. (Motive is _____).	c) Activity
4) Recently Mr. P is very depressed. His productivity is coming down. He is always worried about the future of his children. He is 35 years old with three children. He is looking for a permanent job. (Motive is _____).	d) Independence
5) Mr. Q loves music. He works in a family planning organisation. He brings his transistor radio to the office to listen to music during leisure hours and breaks. He has been insisting that the best way to disseminate family planning education is through audio-visual aids and particularly through movies. He has recently organised a series of dance programmes in his family planning campaigns. He is a very active person. He is doing something or the other all the time. In the office he never relaxes. (Motive is _____).	e) Extension
6) Mr. R is considered a leader in the village where he lives. He is there to help any family in trouble. People keep consulting him. He also takes the needy to hospital, reads and writes letters for them, discusses political affairs and so on. He is also considered a leader in the organisation. He does more than what his job demands. (Motive is _____).	f) Affiliation
7) Mr. S is argumentative. His standard response to any direction by his boss is "What is the use of this?" or "Can you give me more information?" He likes to explore and discover many things before he does anything. His superiors are getting fed up with him because he tries to act like their boss. (Motive is _____).	g) Achievement
8) Mr. T likes to argue. But he is willing to listen. In meetings he puts forth his points clearly. His points are considered most influential and he has a knack of getting others do whatever he wants them to. (Motive is _____).	h) Power

1.5 MOTIVATION OF EMPLOYEES

We have, till now, discussed six motivation theories. All are different yet all are related; the common thread among them is that motivation is goal-directed behaviour. Earlier money was believed to be the main incentive. Maslow suggested a range of needs that are shared by all human beings and which exist in a hierarchy. McClelland introduced the concept that people can learn to increase motivating forces. Herzberg's two-factor theory developed a distinction between maintenance factors (necessary to avoid dissatisfaction) and motivational forces (necessary to motivate workers). Alderfer identified three groups of core needs: existence, relatedness and growth. Vroom, Porter and Lawfer suggest ways to understand the motivational process: individual preference as to desired outcome of activities and behaviour coupled with the expectation that it can be achieved.

1.6 MANAGEMENT'S ATTITUDES TOWARDS EMPLOYEES

The health services administrator is faced with the day-to-day operational necessity of motivating employees. An important factor contributing to the manager's success will be attitudes about employees. There is a great deal of evidence that people respond to leadership, it is clear that a leader/administrator who can help others meet their needs as they perceive them will be followed. We have to realise that the way in which a manager tries to motivate the employees is directly influenced by the assumptions he or she makes about the employees. And the manner in which motivation is approached depends largely upon the manager's attitudes about the basic nature of people. Are they lazy or are they self-starters? Do they want loose or close control? Are the employees content with satisfying lower level needs or do they strive also for esteem and self-actualisation fulfilment? As managers begin to address these questions, they express their attitudes and assumptions about nature of the organisation's personnel. One of the finest summaries of these managerial assumptions has been provided by Douglas McGregor. He called these assumptions theory X and theory Y. According to McGregor, the traditional organisation with its centralised decision making, superior subordinate pyramid, and external control of work is based upon assumptions about human nature and human motivation.

Theory X: What is commonly called the autocratic or authoritarian style of management has arisen, in part, as an out growth of strong centralisation of control. In its extreme form, such a management style begins to closely resemble the classic theory X of McGregor. Theory X assumptions hold that people are basically lazy and that in order to get them to work it is often necessary to use coercion and threats of punishment. These assumptions drawn by McGregor are summarised in Table 1.3.

From this summary of their attitudes, we can arrive at two conclusions regarding theory X managers. First, they like to control their subordinates because they feel such control is in the best interests of both the organisation and its personnel. Second, they believe that people work to satisfy their lower-level needs (security above all else) and that upper-level need satisfaction is not very important.

Behavioural Sciences research has clearly demonstrated that management based on theory X is definitely not effective over a long period of time, especially in the health sector. Employees subjected to management based upon these assumptions take little initiative, make few innovations, and enjoy no sense of achievement or job satisfaction. Most health sector employees will not function under the stringent, centralised direction and control implicit in the theory X approach to management (Table 1.3).

Table 1.3: List of Theory X and Theory Y Assumptions about Human Nature

Theory X	Theory Y
1) People by their very nature, dislike work and will avoid it when possible.	1) Work is as natural as play, if the conditions are favourable.
2) Most people are not ambitious, have little desire for responsibility, and prefer to be directed.	2) Self-control is often indispensable in achieving organisational goals.
3) Most people have little capacity for creativity in solving organisational problems.	3) The capacity for creativity in solving organisational problems is widely distributed in the population.
4) Motivation occurs only at the physiological and security levels.	4) Motivation occurs at the social, esteem, and self-actualisation levels, as well as at the physiological and security levels.
5) Most people must be clearly controlled and often coerced to achieve organisational objectives.	5) People can be self-directed and creative at work if properly motivated.
	6) Under conditions of modern life, the intellectual potentialities of the average human being are only partly utilised.

Theory Y: McGregor felt that management needed practices based on a more accurate understanding of human nature and motivation. As a result, McGregor developed an alternate theory of human behaviour called Theory Y, which is highly applicable in the health sector. It is based on the belief that the most effective way to get results is to work with people rather than to use them. If employees are lazy, in-different, unwilling to take responsibility or are uncooperative, theory Y implies that the causes lie in management's methods of organisation and control, thus theory Y places the problems squarely in the lap of management. The theory Y assumptions drawn by McGregor are summarised in Table 1.3.

Theory X and Theory Y are attitudes or pre-dispositions management has towards employees. They are important concepts and are related to motivation because they represent a dichotomy of how the manager may approach the task of motivating others. The hospital administrator who operates under Theory Y assumptions will see the task as creation of an organisational climate in which the health services worker can find satisfaction and, therefore, fulfil needs while performing the job.

1.7 TECHNIQUES TO MOTIVATE EMPLOYEES

Job design has emerged as an important application area for work motivation. It refers to any activities involving work changes. With the purpose of increasing the quality of the employee's job experience or improving the employee's productivity. Now with quality of work life (QWL) becoming major societal issue all over the world, the job design has taken a broader perspective. Job design can employ techniques such as job rotation, job traction, and job enlargement and job enrichment. Since job enrichment dominates the other techniques of job design, this technique is going to be discussed in detail here.

Job Enrichment

Since job enrichment represents an extension of other techniques of job design in a more behaviourally sophisticated manner which attempts to build psychological motivators. The term job enrichment was originally coined by Frederick Herzberg, based on his two factor theory of motivators and maintenance factors, with the assumption that in order to motivate employees, the job must be designed to provide opportunities for achievement, recognition, responsibility, advancement and growth. The technique entails "enriching" job so that these factors are included. In particular job enrichment is concerned with designing jobs that include a greater variety of work

content; require a higher level of knowledge, and skill; give employees more autonomy and responsibility in terms of planning, directing, and controlling their own performance; and provide the opportunity for personal growth and a meaningful work experience. Job enrichment brings many benefits which includes motivating employees for growth and self-actualisation. The job is built in such a way that intrinsic motivation is encouraged, with an aim to improve performance.

Research has found that certain dimensions can be built with the work that will bring about higher output, lower absenteeism, higher quality and greater internal work motivation. Hackman and Oldham have identified five core dimensions that especially provide enrichment for jobs. Its desirable for jobs to have all five of these dimensions (see Table 1.4 for five core dimensions of jobs). If one is perceived to be missing, employees are psychologically deprived and motivation tends to be reduced. These core dimensions tend to improve motivation, satisfaction and quality of work and to reduce turnover and absenteeism.

Table 1.4: Five Core Dimensions that Enrich Jobs

1) **Skill variety:** The Degree to which the job requires a variety of different activities so the worker can use a number of different skills and talents.

2) **Task Identity:** The degree of which the job requires completion of a whole and identifiable piece of work.

3) **Task Significance:** The degree to which the job has a substantial impact on the lives or work of other people.

4) **Autonomy:** The degree to which the job provides substantial freedom, independence and discretion to the individual in scheduling the work and in determining the procedures to be used in carrying it out.

5) **Feedback:** The degree to which carrying out the work activities required by the job results in the individual obtaining direct and clear information about the effectiveness of his or her performance.

1.8 BENEFITS FOR JOB ENRICHMENT FOR HOSPITALS

When there is a positive match between job environment efforts and employees who are desirous of holding more challenging jobs, job enrichment can offer several benefits for the professionals. These benefits are for both the Job holders and for Organisations as such:

A) **Benefits for Individual Employees**

- More job satisfaction
- Greater responsibility and authority
- The opportunity to experience more growth and development
- A greater sense of achievement
- More job autonomy
- A greater diversity of job experiences
- More practice at making decisions

B) **Benefits for the Organisation**

- Higher level of job performance
- Increased quality of patient care and services
- Improvement in quality of decisions
- Employee's loyalty and commitment to organisation increased
- Fewer absenteeism
- Lower turnover rate

1.9 SELF-ASSESSMENT TEST

1) Motives are the "whys" of behaviour. What does this statement mean?

2) What are the common defense mechanisms people use when they are frustrated.

3) Briefly define the three classification of motives.

4) Explain Maslow's theory of motivation and relate it to work motivation and Herzberg's two-factor theory.

5) Identify the key situations in your hospital/health sector where you think the administrator/manager should be more of a Theory Y person and why.

1.10 LET US SUM UP

The first step in understanding motivation is to realise that it is a means of understanding the way people behave in organisations. Further, a comprehensive understanding of motivation is provided through the process sharing relationship between needs, drives and goals. The key motives related to employee behaviour, especially the secondary motives are explained. The knowledge and relation of these key motives, influencing employees behaviour can certainly help the hospital administrator to understand the work attitude of each employee. With this background, theories of motivation based upon work motivation approaches have been discussed in detail under two headings of content and process theories. Next the relevance of management's attitudes towards employees in relation to motivation, have been discussed based upon the theory X and theory Y and finally the last section discussed the more applied areas of motivating employees performance through Job Design and Job Enrichment in order to enhance quality of work life.

1.11 KEY WORDS

Frustrations : The thwarting or blocking of an attempt at need satisfaction.

Hygiene factors : Identified by Herzberg, are factors that will not motivate people by their preserve but will cause dissatisfaction by their absence.

Job Enrichment : A job redesign technique that attempts to build psychological motivators into job.

Motivation : A psychological drive or force that directs someone toward objectives.

Motive : An internal or external force consisting of needs, drives and wants that impels people towards certain goals in life.

Needs : Internal biological and learned states within people that help to initiate, guide and direct behaviours towards certain goals.

UNIT 2 LEADERSHIP

Structure

2.0 OBJECTIVES

After going through this unit, you should be able to:

- describe the importance of leadership in the health organisations;
- identify the major leadership styles;
- explain the situational approaches to leadership;
- discuss the main functions of a leader; and
- explain the leadership skills required for a hospital administrator.

2.1 INTRODUCTION

The previous unit on "Motivation" discussed the importance for health administrator/ manager to have mastery over the concept and process of work motivation to fully understand employee behaviour. This present chapter on leadership is linked to the previous one in the sense that an administrator/manager requires leadership skill to empower employees and motivate them to work in an efficient manner to achieve health organisation's goal. Moreover, motivating employees and developing positive attitude towards them is one of the crucial skills that the leader needs to develop. This present unit on leadership would enable you to understand importance of leadership, leadership behaviour. The thrust of this unit would be to discuss and analyse the widely recognised styles of leadership. This is followed by an examination of roles and functions of leadership. The last part of this unit gives description of the leadership skills which are increasingly being recognised as crucially needed for today's changing and demanding health organisations. The difference between **styles, roles** and **functions** and **skills** which are the main parts of this unit, are that **leadership styles** deal with the **way** leaders influence followers; **Roles and Functions** are **What** leaders do, and **skills** are concerned with **how** leaders can be effective.

2.2 IMPORTANCE OF LEADERSHIP AND ITS DEFINITION

For the health care organisations/hospitals, to achieve the goal of quality of patient care and health for all in the next millenium, the twenty-first century require a generation of

leaders. For the health organisations to endure and quality patient care to be provided, effective leadership is required. The simple reason for this is that an important part of management consists of dealing with and working through people. Further more, some one must determine, initiate, coordinate, influence, and over see work activities of other individuals.

We all must have observed that every group of people that performs near to its total capacity has some person as its head who is skilled in the art of leadership. This skill seems to be a compound of at least four major ingredients:

- the ability to use power effectively and in a responsible manner,
- the ability to comprehend that human beings have different motivation forces at different times and in different situations,
- the ability to inspire, and
- The ability to act in a manner that will develop a climate conducive to responding to and assuring motivations.

Leadership is the process of encouraging and influencing people to direct their efforts towards the achievement of some particular goal(s). It is the human factor that helps a group identify where it is going and then motivate it towards its goals. In fact, **Leadership transforms potential into reality**. Leadership is the ultimate act that identifies, develops, and uses the potential that is in an organisation and its people.

The Fundamental Principles of Leadership

Since people tend to follow those who, in their view, offer them a means of satisfying their own personal goals, the more managers understand what motivates their subordinates and how these motivations operate, and the more they reflect this understanding in carrying out their managerial actions, the more effective they are likely to be as leaders.

Leadership can be formally defined as "The process of influencing the activities of an individual or a group in efforts towards the achievement of some particular goals in a given situation." Another definition defines leadership as "Interpersonal influence exercised in a situation and directed through the communication process towards the attainment of a specialised goal(s)". Besides influence, leadership has been defined in terms of group processes, personality, power, goal achievement, interaction, role differentiation etc.

People have been concerned about the nature of leadership since the beginning of history.

2.3 TRAIT APPROACHES TO LEADERSHIP

Prior to 1949, studies of leadership were based largely on an attempt to identify the traits that leaders possess, starting with the "Great man" theory that leaders are born and not made, a belief dating back to the ancient Greeks and Romans researchers have tried to identify the physical, mental and personality traits of various leaders. But this "Great man" theory lost much of its acceptability with the rise of the behaviourist school of psychology.

Various researchers identified specific traits related to leadership ability; five physical traits (such as energy, appearance, and weight), four intelligence and ability traits, sixteen personality traits (such as adaptability, aggressiveness, enthusiasm, and self-confidence), six task-related characteristics (such as achievement drive, persistence, and initiative), and nine social characteristics (such as cooperativeness, interpersonal skills, and administrative ability). More recently the following key leadership traits were identified: drive (including achievement, motivation, energy, ambition, initiative, and tenacity), leadership motivation (the aspiration to lead but not to seek power as such), honesty and integrity, self confidence (including emotional stability), cognitive ability, and an understanding of the task.

But in general and practically, the study of leader's traits has not been a very fruitful approach to explaining leadership. Not all leaders possess all the traits. The trait approach gives no guidance as to how much of any trait a person should have. Most of these so-called traits are really patterns of behaviour.

Much of the recent emphasis has shifted away from traits and towards identification of leadership behaviours. As per this view, successful leadership depends upon appropriate behaviours, skills and actions, and not on personal traits. This agreement is very significant and practically true also since behaviours can be learned and changed, while traits are relatively fixed. Leadership behaviour, to be precise, is the way or the style the leaders actually carry out their jobs.

2.4 LEADERSHIP STYLES

Leadership styles make a difference. The total pattern of leader actions as perceived by their employees, is called Leadership Style. It represents the leader's philosophy; skills and attitudes and behaviour towards others. The styles differ on the basis of motivation, power, or orientation towards people and tasks. Many different classifications of leadership styles have been proposed over the years.

Four important styles of leadership behaviour which are widely recognised to be highly useful and relevant for today's organisations are discussed here:

- Continuum of leadership behaviour
- Managerial grid style
- Life-cycle or situational approach
- Four systems of management leadership

2.4.1 Continuum of Leadership Behaviour

In 1958, Robert Tannenbaum and Warren H-Schmidt formulated a continuum describing the decision-making authority dimension of leadership. It has two polar ends with varying amounts of leader-subordinate decision-making authority. At one extreme the leader makes the decisions, tells his or her subordinates, and expects them to carry out that decision. At the other extreme, the leader fully shares his or her decision making power with subordinates, allowing each number of the group to carry an equal voice — one person, one vote. Between these two extremes of autocratic to laissez-faire fall a number of leadership styles, with the style selected dependent upon forces in the leader, the operating group, and the situation. As shown in Fig. 2.1, there is a relationship between the degree of authority used and the amount of freedom available to subordinates in reaching decisions. This continuum is seen as a zero-sum game; as one gains, the other loses, vise versa.

i) **Autocratic:** In the continuum of leader authority presented in Fig. 2.1, the autocratic end represents the manager who makes decisions and announces them to the group. The total interacting relationship and work setting have been determined by the manager and he or she provides hardly any opportunity for a subordinate to participate.

ii) **Consultative:** This style is characterised by description 2 and 3 in the continuum. Here the manager sells or makes the decision concerning the work activity, its purpose, how it is to be done, when and by whom, and invites questions from subordinates.

iii) **Participative:** This style indicates that the manager identifies purposes, problems and means by which activities should be carried out; presents a tentative decision already made, that is subject to change or presents the problem to subordinates, gets suggestions, and then makes the decision. This represents the participative style of leader decision authority wherein the area of decision making freedom for subordinates is much greater and use of authority by the manager is much smaller than with autocratic and consultative style.

This participative leadership style is a very powerful motivator enabling employees to have some measure of influence and control over work related activities.

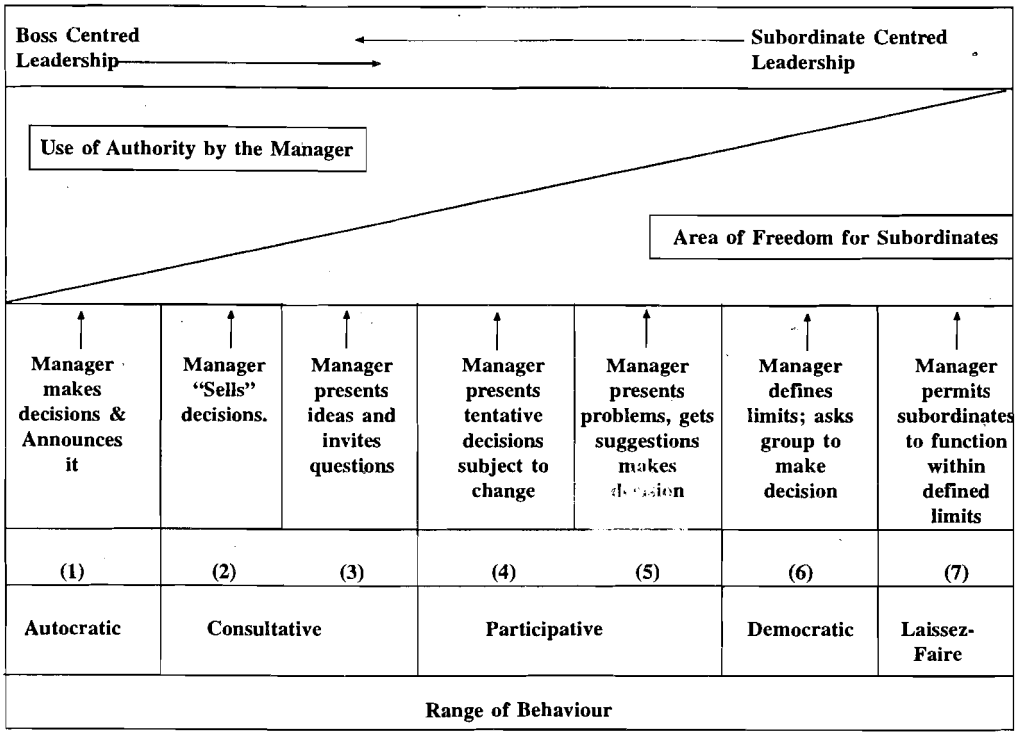

Fig.2.1: Leadership Behaviour Continuum by Tannenbaum and Schmidt

iv) **Democratic:** In the democratic style of leadership, the manager defines the limits of the situation and problem to be solved and asks the group to make decisions, the subordinates have a relatively large area of decision freedom.

v) **Laissez-Faire:** This style at the far end of the continuum is called free rein, wherein subordinates are permitted to function within limits set by the manager's superior. There is no interference by the manager, who may participate in decision-making, but attempts to do so with no more influence than any other member of the group.

Interpreting Autocratic to Democratic—which is correct?

Research and experience has shown that no single decision authority style is correct all the time. The leader needs to change and adopt the style to fit the situation. In the hospital, in the operating room, the physician or the surgeon uses the autocratic style, but while dealing with other professionals in the meeting room or in problem solving situation, the democratic style may be more appropriate.

Factors Affecting Style

The leader decision authority style adopted by the manager depends a great deal on factors such as:

- Importance of results,
- Nature of the work,
- Characteristics of workers, and
- Personal characteristics of the manager.

If there is a disaster or crisis situation emerges and the task has to be performed immediately, the health services manager needs to adopt an autocratic style of the continuum. But, if time is available with the manager and other people are equally creative and empowered, the manager needs to adopt a participative or democratic style.

Subordinates characteristics—their training, education, motivation, and experience can influence the leader authority style adopted by the manager. This factor is closely related to type of work. If subordinates are skilled professionals, as opposed to unskilled, the manager may seek opinions more readily and use a consultative or participative style. But in the case of unskilled or inexperienced employees the manager may have to make the decisions unilaterally. Moreover, personal characteristic

of the manager can affect the leader authority style adopted. Some individuals, by reason of their personality, previous experiences, values, and cultural background, function better under one style or another may find it difficult to change with the situation. For example in the health care organisations when a physician becomes an administrator, he may find it difficult to adjust styles because of previous training and experience because in the doctor-patient relationship the doctor has always been the primary decision maker. But as a manager, participative approach is often more appropriate particularly when working with other professionals.

But, it must be kept in mind that no one style is appropriate at all times. Which style is more appropriate depends upon the situation which includes work environment, what is to be done, the nature of employees, and the organisational climate.

2.4.2 Managerial Grid Style

One very popular approach to identifying leadership style of practicing managers is a graphic portrayal of a two-dimensional view as developed by Blake and Mouton. They proposed a managerial grid consisting of two dimensions: concern for production and concern for people. The grid, depicted in Fig. 2.2 has 9 possible gradients or degrees associated with each dimension, on each of axis, creating 81 possible combinations of concern for production on the horizontal axis and concern for people on the vertical axis. A1 represents low concern for the dimension and A9 presents high concern.

Rather than try to direct attention to all 81 combinations, grid development practitioners tend to focus on 5 "Critical Combinations". The combinations are usually referred to by number, and when people become familiar with the grid they know what the numbers mean. Although, they are briefly described in Fig. 2.2. Let us examine each combination in more detail:

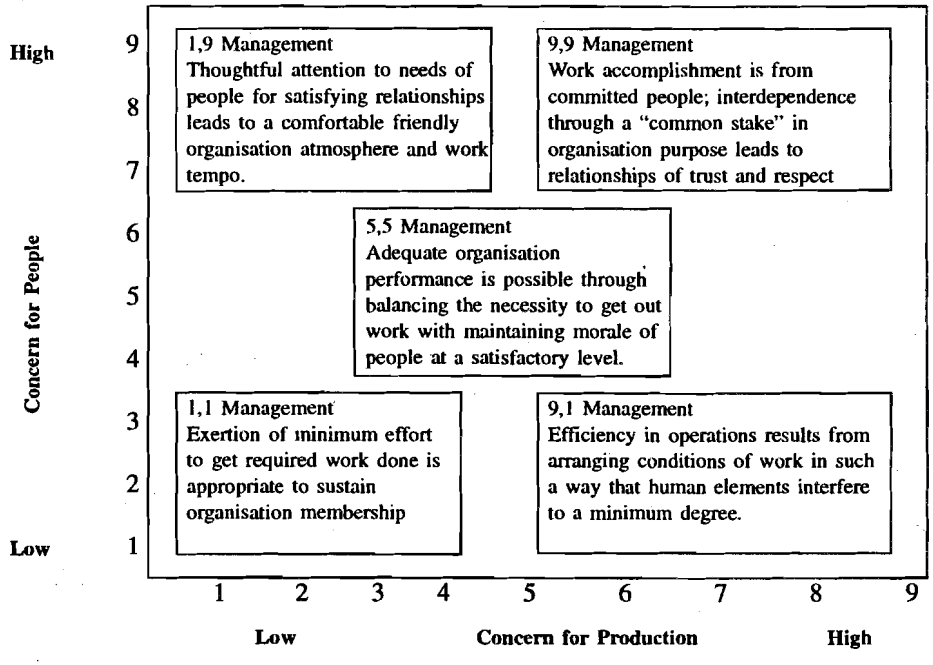

Fig. 2.2: The Managerial Grid

i) **The 1,1 Managerial Style** is often referred to as Impoverished Management. In this style, the manager tends to put people in jobs and then leave them alone. He or she does not check upon their work (no concern for production) or try to interact with them by offering praise and encouraging them to keep up the good work (no concern for people).

ii) **The 9,1 Managerial Style** is often referred to as Task Management. This manager has a high concern for production and a low concern for people. He or she plans the work and pushes to get it out, similar to the autocratic style, little interest is shown for people, if they can not fulfil the task they are replaced by others who can.

iii) **The 1,9 Managerial Style** is called as Country Club Management because of high emphasis given to concern for people's feelings, comfort, and needs. The manager is basically interested in obtaining loyality from the subordinates and tries to motivate them to do their work without putting pressure on them.

iv) **The 5,5 Managerial Style** is often referred to as Middle-of-the-road Management. The manager assumes that there is an inherent conflict between the concerns for production and people. Therefore, he or she tries to compromise and balance the two dimensions.

v) **The 9,9 managerial style** is referred to as Team Management. It is regarded by many as the best and the ideal style, as the one that both managers in particular and the organisation in general should employ. This style focuses on people's higher level needs, involves subordinates in decision making and assumes that the goals of the people and the goals of the organisation are in harmony. As a result the 9,9 manager believes that maximum concern for both dimensions will result in the greatest overall efficiency.

Which one of these basic styles is best? The answer will depend on the needs of the subordinates, the manager, and the organisation.

Activity 1

Interview a representative sample of managers in an organisation and try to find out their preference for various managerial styles.

2.4.3 Life Style or Situational Approach to Leadership

One of the most widely practiced leadership models is Paul Hersey and Ken Blanchard's situational leadership theory. This very popular approach to management style training and development has been used as a major training device at such Fortune 500 companies as Bank of America, IBM, Mobile Oil, and Xerox and it has also been widely accepted in all the military services.

Situational leadership, an extension of the managerial grid approach is a contingency theory based on an interplay among:

- the amount of guidance and direction (task behaviour) a leader gives,
- the amount of socio-emotional support (relationship behaviour) a leader provides, and
- The readiness levels that follower's exhibit in performing a specific task, function or objective. This concept was developed to help people attempting leadership, regardless of their role, to be more effective in their daily interactions with others. It provides leadership with some understanding of the relationship between an effective style of leadership and the level of readiness of their followers. Successful leadership is achieved by selecting the right leadership style, which Hersey and Blanchard argue is contingent on the level of the followers maturity.

It must be noted here that situational leadership is a model, not a theory. Its concepts, procedures, actions, and outcomes are based upon tested methodologies that are practical and easy to apply.

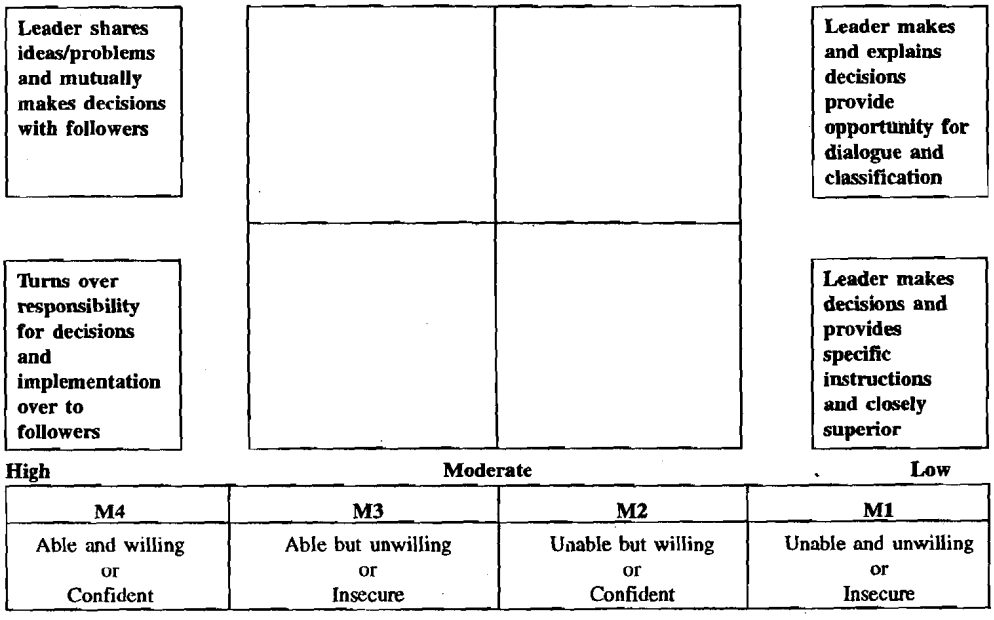

Fig. 2.3: Situational Leadership Style

Basic Concepts of Situational Leadership

According to this model, there is no best way to influence people, which leadership style a person should use with individuals or groups depends on the readiness level of the people the leader is attempting to influence. Fig. 2.3 summarises the situational leadership approach which identifies the following styles:

i) **Task Style:** The leader organises and defines roles for members of the work-group; the leader explains the tasks that members are to do and when, where, and how they are to do them.

ii) **Relationship Style:** The leader has close, personal relationships with the members of the group, and there is a two-way communication along with psychological and emotional support.

iii) **Maturity Level:** The level of maturity is defined by three criteria:

- Degree of achievement motivation
- Willingness to take on responsibility
- Amount of education and/or experience

According to Hersey and Blanchard, it has two components; Job maturity and psychological maturity. The first encompasses one's knowledge and skills and the individuals high on this have the knowledge, ability, and experience to perform their job tasks without direction from others. Psychological maturity relates to the willingness or motivation to do something. Individuals high in psychological maturity don't need much external encouragement; they are already intrinsically motivated.

Activity 2

Interview several people asking them to describe situations where someone's attempt to influence them was successful or unsuccessful.

.....

.....

.....

.....

.....

.....

.....

Situational leadership model uses two leadership dimensions i.e. relationship and task and by considering each as either high or low combines them into four specific leadership styles: Authoritative or telling; consultative or selling; participative or supportive; and delegating. They are described as follows:

a) **Authoritative or Telling Style:** This is a high task, low relationship style and is effective when followers are at a very low level of maturity. The leader defines roles and tells other what, how, when and where to do various tasks. It emphasises authoritative or directive behaviour.

b) **Consultative or Selling Style:** This is a high task, high relationship style and is effective when followers are on the low side of maturity. Here the leader provides both directive and supportive behaviour.

c) **Participative or Supportive Style:** This is a low task, high relationship style and is effective when followers are on the low side of maturity. Here the leader and follower share in decision-making, with the main role of the leader being facilitative and communicating.

d) **Delegating Style:** This is a low-task, low-relationship style and is effective when followers are at a very high level of maturity. The leader provides little direction or support.

The final component in Hersey and Blanchard's theory is defining four stages of maturity:

- **M1:** People are both unable and unwilling to take responsibility to do something. They are neither competent nor confident, so they need clear and specific directions.
- **M2:** People are unable but willing to do the necessary job tasks. They are motivated but currently lack the appropriate skills. The high task behaviour compensates for the followers lack of ability, and the high relationship behaviour tries to get the followers psychologically to "buy into" the leaders desires.
- **M3:** People are able but unwilling to do what the leader wants. This stage creates motivational problems that are best solved by a supportive, non-directive, participative style.
- **M4:** People are both able and willing to do what is asked to them and so the leader at this stage does not have to do much.

The Fig. 2.3 integrates the various components into the situational leadership models. As followers reach high levels of maturity, the leader responds by not only continuing to decrease control over activities, but also by continuing to decrease relationship behaviour as well.

You might have noticed that the high similarity between Hersey and Blanchard's four leadership styles and the four extreme "corners" in the managerial grid.

2.4.4 Four Systems of Management Leadership

Rensis Likert proposed four basic systems, or styles, of organisational leadership that evolved from the many years of research by the Michigan group. Table 2.1 summarises these four styles, called **Systems of Management Leadership.**

The manager who operates under system 1, approach is very authoritarian and actually tries to exploit the subordinates. In system 2, the manager takes a paternalistic approach while still being autocratic. Behaving as a benevolent autocrat the leader maintains strict control over the subordinates and never delegates authority to work group members, but he or she "pats them on the head" and "does it for their best interests". In System 3, the manager uses a consultative approach; that is, though, the leader consults the subordinates and receives participative input from work group members, but he/she still maintains the right to make final decisions. Finally, in system 4, the manager uses a democratic style; this manager gives some directions to work group members but provides for total participation and takes decisions by consensus and majority.

Table 2.1: Linker's Four Systems of Management Leadership

CHARACTERISTICS	SYSTEM-1 (Exploitative Authoritative	SYSTEM-2 (Benevolent Authoritative)	SYSTEM-3 (Consultative)	SYSTEM-4 (Participative Group)
Trust in Subordinates	None	Condescending	Substantial	Complete
Motivation Accomplished by	Fear and Threats	Rewards and Punishment	Rewards, Punishment involvement	Group Participation, involvement
Communication	Very Limited	Limited	Fairly Widespread	Widespread
Interpersonal interaction	Very Limited	Limited	Moderate Amount	Extensive
Decision Making	Centralised	Mostly Centralised	Broad participation Allowed	Dispersed
Goal Setting	Centralised	Mostly Centralised	Some Participation Allowed	Participation Allowed
Control	Centralised	Mostly Centralised	Moderate Delegation	Extensive Delegation
Informal Organisation	Always Developed and in Opposition to the Organisation	Usually developed and partially in opposition to the organisation	May be Developmend and May Support or Oppose the Organisation	Informal Organisation is the same as the formal organisation

To have an empirical research back up to support which style is more effective, Likert and his colleagues asked thousands of managers to describe on an expanded version of the format shown in Table 2.1, the highest and lowest producing departments with which they had experience. Quite consistently, the high-producing units were described according to systems 3 and 4, and the low-producing units fell under systems 1 and 2. This led Likert to conclude that the best way for all organisations to manage employees is to move towards system 4.

Leadership Styles in Today's Perspective

Tanenbaum's continuum of leadership behaviour, Blake and Mouton's managerial grid, Hersey and Blanchard's life cycle, and Likert's four systems represent the established approaches to leadership style. They have been practically applied and tested for a number of years and are still relevant in the perspective sense of what leaders should do, more so in today's demanding and emerging organisations.

There is accumulating evidence that a leader's style can make a difference. For example, recent studies have concluded that the leader's style is the key to the formulation and implementation of strategy and also plays an important role in work group members creativity. In other words, there is little doubt that the way (style) leaders influence work group members can make a difference in their own and their people's performance.

This immense concern and impact of the styles of leadership have given way to importance of the roles and functions of leadership and skills required for effective leaders. Now in the following sections, in this Unit, you will appreciate and learn **what** (Roles and Functions) and **how** (Skills) of leadership.

2.5 ROLES AND FUNCTIONS OF LEADERSHIP

Now we turn to the roles and functions of leaders by answering the question, "What do effective leaders do on a day-to-day basis?" There are many tasks that the leader must perform. The many functions listed out, with behavioural descriptions, in Table 2.2 can be conceptually collapsed in to the four managerial functions shown as follows:

i) **Communication:** Leaders are effective and successful not only because of what they do but also because of how their acts are interpreted. They need to be able to tell, show, write and listen so that they can convey to others what they are doing and want to be done. The leader of an organisation spends about 60 to 90 per cent of the working day on communication. This also includes exchanging routine information and processing paper work. The leaders need versatility in role behaviour in order to deal with people in terms of their individual expectations. Different roles call for different communications behaviour.

ii) **Traditional Management:** This role consists of performing functions like planning, decision-making, and controlling. Its observed role behaviours include setting goals and objectives, defining tasks needed to accomplish goals, scheduling employees, assigning tasks, producing routine instructions, defining problems, handling day-to-day operational crises that usually emerge in hospital kind of organisations, deciding what to do, developing new procedures, inspecting work, walking around inspecting and supervising the work, monitoring performance data, and doing preventive maintenance.

iii) **Human Resource Management:** This function contains the most behavioural categories, motivating/reinforcing, disciplining, staffing, training and development and most importantly building effective teams for goal achievement. The observed behaviours of this activity includes allocating formal rewards, asking for input, conveying appreciation, giving credit where due, listening to suggestions, giving positive feedback, developing job descriptions, reviewing applications, orienting employees, arranging for training, clarifying roles, coaching, etc. And under this category the most important function is developing team work which requires special attention and discussion.

Developing Team Work: One of the most important functions of leadership is to develop team work. This is most likely to develop when the leader builds a supportive environment for it. Supportive measures taken by the leader help the group to take the first necessary steps towards team work and these steps become the basic trust, and compatibility. Studies have shown that greater the trust and compatibility in a team, the greater their effectiveness tends to be; so leader will seek to develop an organisational climate that build's these conditions. There are three key factors in the development of team work: the leader, the subordinates, and the environment as shown in Fig. 2.4 below. They are interdependent. For example if the leader cannot get along with the subordinates, the group members do not like the leader or the environment is not conducive to effective team work, over all group efficiency suffers.

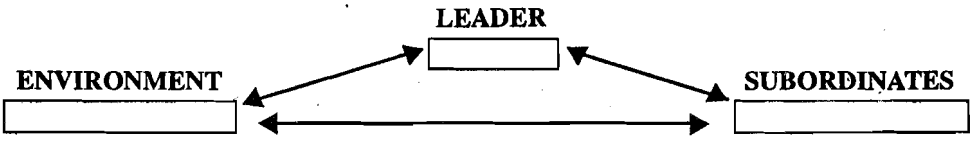

Fig. 2.4: Team-work Determinants

iv) **Networking:** This activity consists of socialising/politicking and interacting with outsiders. The observed behaviours associated with this activity include non work related interactions, informal joking around; dealing with consumers, clients, suppliers. attending external meetings, and doing/attending community service events.

What do Effective Leaders Do?

Comprehensive studies have been conducted to understand what do effective real managers and leaders do, and it was found that communication and human resource management functions, described above, made by far the largest relative contribution to the leader's effectiveness, and that the traditional management activities, and especially the networking activities, made by far the least relative contribution (Luthans, *et al*, 1985). Luthans and his associates explained that if effectiveness is defined as the perceived quantity and quality of the performance of a manager's unit and his or her work group member's satisfaction and commitment, then the biggest relative contribution to leadership effectiveness comes from the human oriented activities communication and human resource management.

Table 2.2: Leadership Activities and Behavioural Descriptors

1) Planning/Coordinating a) Setting goals and objectives b) Defining tasks needed to accomplish goals c) Scheduling employees, time-tables d) Assigning tasks and providing routine e) Coordinating activities of each work group member to keep work running smoothly. f) Organising the work	2) Staffing a) Developing job descriptions for position openings b) Reviewing applications c) Interviewing applicants d) Hiring e) "Filling in" where needed
3) Training/Developing a) Orienting employees, arranging for training seminars, etc. b) Clarifying roles, duties, job descriptions c) Coaching, mentoring, walking work group members through task d) Helping work group members with personal development plans	4) Decision Making/Problem Solving a) Defining problems b) Choosing between two or more alternatives or strategies c) Handling day-to-day operational crises as they arise d) Weighing the trade-offs; cost benefit analyses e) Actually deciding what to do f) Developing new procedures to increase efficiency
5) Processing Paper work a) Processing mail b) Reading reports, in-box c) Writing reports, memos, letters, etc. d) Routine financial reporting and bookkeeping e) General desk work	6) Exchanging Routine Information a) Answering routine procedural questions b) Receiving and disseminating requested information c) Conveying results of meetings d) Giving or receiving routine information over the phone e) Staff meetings of an informational nature
7) Montoring/Controlling Performance a) Inspecting work b) Walking around and checking things out, touring c) Monitoring performance data (e.g. computer printouts, production, financial reports) d) Preventive maintenance	8) Motivating/reinforcing a) Allocating formal organisational rewards b) Asking for input, participation c) Conveying apprecition, compliments d) Giving credit where due e) Listening to suggestions f) Giving positive performance feedback g) Increasing job challenge h) Delegating responsibility and authority i) Letting work group members determine how to do their own work j) Sticking up for the group to managers and others, backing a work group member
9) Disciplining/Punishing a) Enforcing rules and policies b) Demotion, firing, layoff c) Any formal organisational reprimand or notice	10) Interacting with Outsiders a) Public relations b) Customers c) Contacts with suppliers d) External meetings e) Community-service activities

11) Developing Team Work a) Create an environment in which team work can happen. b) Creating trust, cooperation and compatibility with the subordinates d) Define tasks and motivate the team members towards goal attainment.	12) Socialising/Politicking a) Nonwork related chitchat (e.g. family or personal matters) b) Informal "joking around" c) Attending external meetings/ conferences/seminars d) Attending community service events.

Human oriented leadership skills may be of considerable value in meeting the challenges of global competition, and of providing the quality of health care services. The last section in this unit now focusses on these leadership skills.

2.6 LEADERSHIP SKILLS

As the above section indicates, there is now recognition in both leadership theory and practice of the importance of skills, **how** leaders behave and perform effectively the various functions. Both styles and roles/functions are closely related to skills and can be used as a point of departure for the discussion of skills. The results of various research studies have combined into the following four categories of effective leadership skills:

i) **Participative and Human Relations:** These includes supportive interpersonal communication and team building.

ii) **Competitiveness and Control:** which include being assertive and gaining power and influence.

iii) **Innovativeness and Enterpreneurship:** includes creative problem solving.

iv) **Maintaining Order and Rationality:** includes managing self, stress, conflicts, and time; and doing rational decision making.

These skills categorised into the four groups are interrelated and over lapping. Effective leaders do not perform one skill or one set of skills independent of others. In fact, effective leaders are multiskilled.

With this background two models are developed to identify skills as personal and interpersonal leadership skills. These are summarised in Fig. 2.4. and 2.5.

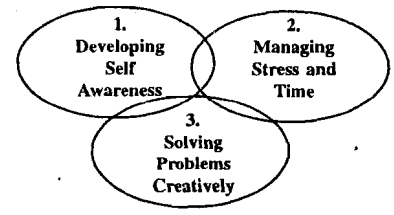

Fig. 2.4: Model of Personal Leadership Skills

In the end, we must discuss the very important managerial skills required for leader, as they move in the hierarchy in the organisations.

Managerial Skills

It is generally agreed that there are at least three areas of skill necessary for carrying on the various functions of management, technical, human and conceptual (see Fig. 2.6). Though they are interrelated in practice, they can be considered separately.

a) **Technical Skill:** Ability to use knowledge, methods, techniques and equipment necessary for the performance of specific tasks acquired from experience education, and training. Examples are the skills learned by medical doctors and pharmacists. This skill is the distinguishing feature of job performance at the operating level; but as employees are promoted to leadership responsibilities, their technical skills become proportionately less important as shown in Fig. 2.6. They increasingly depend on the technical skills of their subordinates and in many cases never practice some of the technical skills that they supervise.

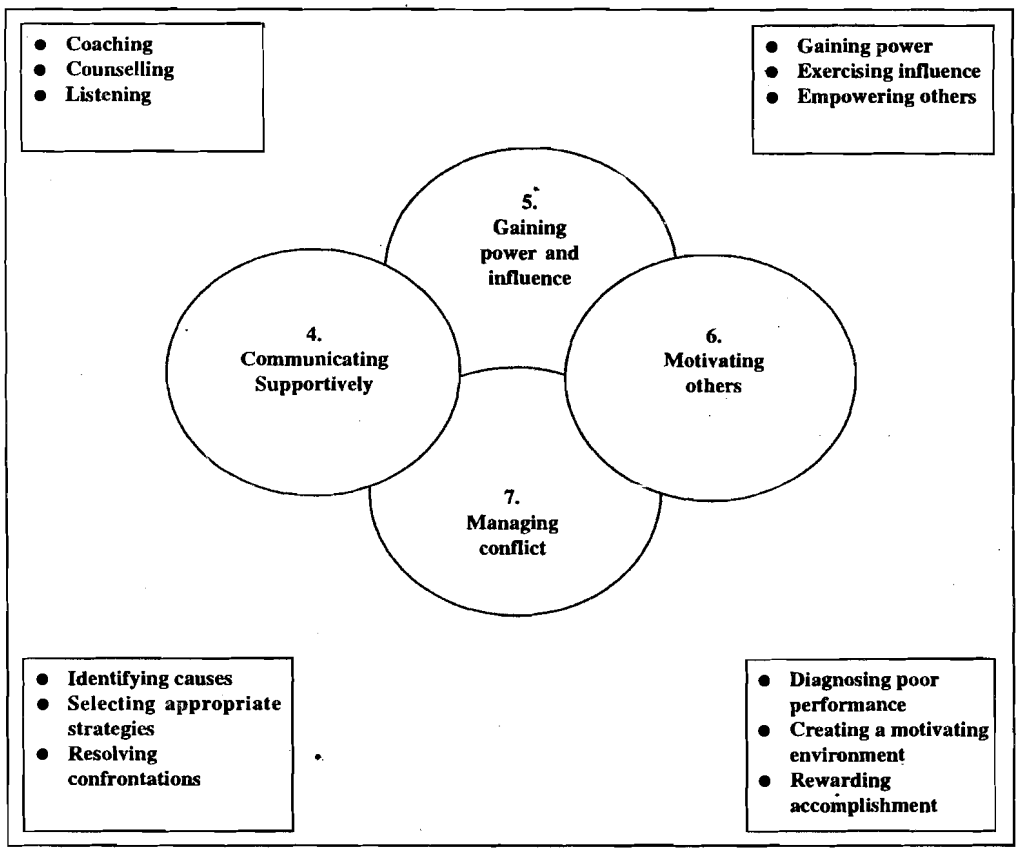

Fig. 2.5: Model of Personal Leadership Skills

b) **Human Skills:** This is the ability to interact and work effectively with people and to build team work. This skill which includes an understanding of motivation and an application of effective leadership is very important for middle level managers who must lead others. Without a solid understanding of such behavioural areas as interpersonal communication, motivation, counselling and directing, middle level managers would be ineffective in leading their subordinates.

c) **Conceptual Skills:** This skill becomes increasingly important in higher managerial jobs. This skill is the ability to understand the complexities of the overall organisations and covers many activities, from formulating organisational objectives, policies and procedures, to developing techniques for handling office work flow. The appropriate mix of these skills varies as an individual advices in management from supervisory to top management positions as illustrated in Fig. 2.6. The leaders place in the hierarchy determines the degree of managerial skill he or she must have. As leaders prove their effectiveness and begin moving up the higher levels in organisation need to learn and use more human and conceptual skills to be effective less technical skill tend to be needed as one advances from lower to higher levels in the organisation. It needs to be noted that while the amount of technical and conceptual skills needed at these different levels of management varies, the common denominator that appears to be crucial at all levels in human skill.

All the styles and roles and functions discussed are very relevant and effective in our health care organisations. How our health care managers and administrators apply these skills and techniques can make a difference in the challenges that lie in the health organisations.

2.7 LET US SUM UP

This unit is concerned with leadership styles (the way leaders influence followers/ subordinates); functions of leadership (what leaders/managers do in their day-to-day jobs; and leadership skills how leadership styles were the main focus which includes Tannenbaum's leadership continuum; Blake and Monton's managerial grid; Hersey and Blanchard's situational leadership model; and Likert's four systems. Each of these

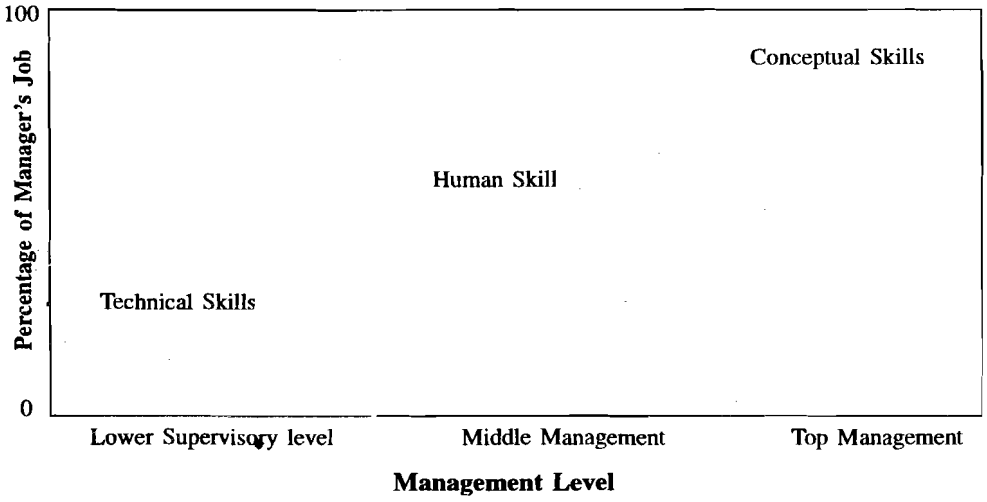

Fig. 2.6: Managerial Skills needed at different Hierarchical Levels

styles have implications for the practice of leadership. The shift in attention from styles to roles and functions reflects a more empirical emphasis on what leaders really do.

The last part of the unit is concerned with leadership skills, how leaders behave and perform effectively the personal and interpersonal skills. Models are especially comprehensive and useful. Managerial skills for leadership emphasise the importance of human skill at all levels from learner to top management.

2.8 SELF ASSESSMENT TEST

1) Identify the importance of leadership for health care organisations.
2) How do Hersey and Blanchard define maturity? Is this variable included in other models of leadership.
3) How does perspective leadership behaviour differ from laissez-faire leadership behaviour?
4) What are some of the needed leadership skills for leaders to be effective?
5) What are the three types of managerial skills every leader must have? Explain.

UNIT 3 UNION AND MANAGEMENT RELATIONS

Structure

3.0 OBJECTIVES

After going through this unit, you should be able to:

- define the trade union, explain the procedure for its registration, specify grounds for cancellation, and describe the rights, liabilities and immunities of members and officers of a registered trade union;
- familiarise yourself about the concept, processes involved, advantages and disadvantages of collective bargaining;
- define "industrial dispute", "industry" and workman identity, proper dispute redressal forum and their working;
- distinguish between strike and lock-out, describe the prohibitions on strikes and lock-outs and specify the effect of illegality;
- apply the norms while terminating the services of workmen and holding domestic enquiry; and
- follow the guidelines to ensure prevention of sexual harassment of women.

3.1 INTRODUCTION

Union Management relations is a dynamic social process. It denotes the relationship between employers and workers organisation or union. The main objective of Union Management relations is to develop harmonious relations between them and to minimise industrial conflicts. Conflicts may be generated over determination of bargaining agent and on issues connected with employment, non-employment, terms of employment such as wages and monetary and fringe benefits and condition of service such as working hours, holidays, leave, method of work, introduction of new technology, health, safety and welfare. Such conflict could lead to strikes and lock-outs. Be that as it may industrial conflicts affect the functioning of the establishment. The dispute may be resolved by collective bargaining and voluntary arbitration or through adjudication. India cannot afford a type of collective bargaining for resolution of industrial disputes. It has adopted an adjudication system.

In this unit you will study the regulation of trade unions collective bargaining, strikes and lock-out, redressal of disputes and disciplinary action by the employer, and sexual harassment at work place.

3.2 TRADE UNION

3.2.1 Statutory Definition

Section 2 (h) of the Trade Union Act, 1926 defines trade union as follows:

a) Any combination, temporary or permanent

b) formed for the purpose of:

   i) regulating the relations between

      —workmen and employers, or

      —workmen and workmen; or

      —employers and employers; or

   ii) imposing restrictive condition on the conduct of any trade or business

But it does not include:

i) any agreement between partners as to their business; or

ii) any agreement between an employer and those employed by him as to such employment; or

iii) any agreement in consideration of the sale of the goodwill of a business or instruction in any profession, trade or handicraft.

3.2.2 Procedure for Registration

For the purpose of registration any seven or more members of a trade union may apply for registration by subscribing their names to the rules of trade Union (Section 4). If however, more than half of the members who have applied for registration cease to the members of the trade union or disassociate themselves from the application by giving a notice in writing to the registrar before the registration is granted the application for registration shall become invalid (Section 4).

An application for registration should be sent in FORM 'A'. It shall accompany with a copy of the rules of trade union and a statement of the following particulars [Section 5 (2)].

a) the names, occupation and addresses of the members making the application;

b) the name of the Trade Union and the address of its head office; and

c) the title, names, ages, addresses and occupations of the officer bearers.

The application for registration shall also accompany with a general statement of the assets and liabilities of the trade union prepared in the prescribed form and containing such particulars as may be required, if the trade union has been in existence for more than one year before the making of an application for its registration.

The rule of a trade union must contain provisions relating to subjects mentioned in Section 6 of the Act and unless it is complied with no registration can be allowed.

If after, examining application for registration the Registrar is not satisfied, he may call for further information for the purpose of satisfying himself that the application complies with the provisions of section 5 and 6 of the Act. Unless he is supplied with the information demanded by him he may refuse to register the union (Section 7 (1)). Where the name under which the trade union is proposed to be registered is identical with any existing trade union or in the opinion of the Registrar, so nearly resembles such name as to be likely to deceive the public or the members of either trade union, he may require the applicants that the name of the Union should be altered and shall refuse to register unless the name is altered (Section 7 (2)) .

The Registrar on being fully satisfied that the trade union has complied with all the requirements needed for registration he shall register the trade union by entering in a register maintained for this purpose in which the particulars relating to the trade union contained in the statement accompanying the application for registration must be entered into (Section 8). Once the condition for registration is complied with it is obligatory on the Registrar to register the union. He will have no discretion in the matter. Similarly where there is a rival group asking for registration, he cannot decide which is the real union for the purpose of registration.

After registering the trade union, the Registrar shall issue a certificate or registration which shall be the conclusive evidence that the trade union has been registered. (Section 9).

3.2.3 Cancellation of Registration of Trade Union

The registration of a trade union can be cancelled on its own application which is approved by a general meeting of the Union or a majority of its members. It may also be cancelled by the Registrar Trade Unions by a written notice of not less than two months on any of the following grounds:

a) that the registration certificate has been obtained by fraud or mistake;

b) that the trade union has ceased to exist;

c) that it has willfully and after notice from the Registrar allowed any rule to continue in force which is inconsistent with any provision of the Act.

d) that it has willfully and after notice from the Registrar contravened any provision of the Act.

e) that it has rescinded any rule providing for any of the compulsory matters required under the Act.

Where withdrawal or cancellation of the registration is to be effected it must be preceded by a requisite notice as well an opportunity to show cause against the proposed action.

Once the certificate of registration is cancelled the Registrar cannot withdraw his order on the ground that the trade union has rectified its mistake. However he can withdraw his order of cancellation if it was passed in violation of Statutory provisions.

3.2.4 Immunity Against Criminal Conspiracy in Trade Disputes

The office bearers and members of a registered trade union are given protection against criminal proceedings for conspiracy under sub-section (2) of section 120 B of the Indian Penal Code in respect of any agreement made between the members for the purpose of furthering any such object of the trade union on which its general funds may be spent unless the agreement is an agreement to commit an offence.

If the members of a registered trade union enter into an agreement to commit an

offence under the criminal laws of the country no immunity would be available to them.

In order to achieve their objective or to enforce their demands more often the unions have to resort to strike against employer. The collective action of the members of trade union in this form amounts to interference with the trade or business of the employer or with the employment of other workers and amounts to conspiracy. A strike in furtherance of a trade dispute is protected under section 17 of the Act. But if it is accompanied with wrongful confinement, assault, mischief or criminal trespass to person or property of the employer it would not be protected.

3.2.5 Immunity from Civil Suits

Section 18 of the Trade Unions Act affords protection to a registered trade union, its office bearers or member against civil suits in respect of any act done in contemplation or furtherance of a trade dispute if the ground is only that such act induces some other person to break a contract of employment or that it is in interference with trade, business or employment with some other person or with the right of some other person to dispose of his capital or labour as he wills.

Protection is further given to a registered trade union against a suit or other legal proceeding in any civil court in respect of any tortious act done in contemplation or furtherance of a trade dispute by an agent of the trade union if it is proved that such person acted without the knowledge of or contrary to express instruction given by the executive of the trade union (Section 18 (2)). The immunity under this section is available to both officers, members as well as unions.

3.2.6 Rights and Liabilities of Registered Trade Unions

a) **Rights to spend general fund :** A registered trade union has right to spend its general funds for any or all of the purposes mentioned in section 15 of the Act. This section enumerates as many as eleven times for which the funds may be spent. But, if the fund is spent for any other purpose it will be illegal.

b) **Right to constitute a separate fund for political purposes:** A registered trade union in case it decides to do so can constitute a separate fund from contributions separately levied for or made to a fund for political objects. Payment may be made from such fund for the promotion of civil and political interests of its members in furtherance of the objects specified in the Act (Section 16).

c) **Right to sue and be sued:** A registered trade union may sue and be sued in its registered name as well as in a representative action.

d) **Right to vote:** Being a legal entity it can vote through a person authorised by it in this behalf.

e) **Right to acquire and dispose of property:** A registered trade union can sue as a pauper (having no capacity to pay court fee).

f) **Right to acquire and dispose of property:** A registered trade union has right to acquire both movable and immovable property and to dispose of the same under its registered name. The expenditures for this purpose shall be met from the fund of the Union.

Liabilities

1) To spend its general funds only for the purposes mentioned in Section 15 of the Act.

2) Not to compel any members of the trade union to contribute to the Political Fund; and not to exclude any member who does not contribute to the said fund from any benefits of the trade union or place him directly or indirectly under any disability or disadvantage as compared to those who contribute to the political fund.

3) To give notice of every change of name or amalgamation to the Registrar.

4) To give notice of the dissolution of a registered trade union within 14 days of the dissolution to the Registrar.

5) To submit returns, together with the general statement to the Registrar.

3.3 COLLECTIVE BARGAINING

3.3.1 Concept and Nature

Collective Bargaining is a method by which problems of wages and conditions of employment are resolved amicably (although often reluctantly), peacefully and voluntarily between labour and management. In short it is a technique for voluntary regulation of industrial relations.

This system is highly developed in industrially advanced countries but in India still a lot has to be done in this regard. The success of collective bargaining depends on many factors such as that the Union should not be under the control or influence of the employer, and employer and the trade union must stand on equal footing to carry on negotiations. For its success it is necessary that workmen should be united and must be in a position to resist exploitation and unjust discrimination.

3.3.2 Processes

The process of collective bargaining is very complicated. It necessitates a great deal of discussion with a full understanding of others view point. The negotiation in a collective bargaining depend quite a bit on the ability, intelligence and maneuvering capacity of the negotiators and on their skillful handling of the issue. He must enjoy the confidence of his own people and he must be in a position to take a crucial decision.

3.3.3 Advantages

This means of settling a dispute has the following advantages:

i) It is quick and efficient

ii) It is democratic

iii) It produces harmonious relationship between employers and workmen.

3.3.4 Disadvantages

This means of settling a disputes has the following disadvantages:

i) the ultimate sufferer i.e. consumer is not represented in the negotiation;

ii) it flows more from power politics than from rational thoughts;

iii) in case of failure of negotiations unpredictable consequences may follow.

3.4 RESOLUTION OF INDUSTRIAL DISPUTES

3.4.1 Scope and Applicability of the Industrial Disputes Act

Labour Law plays an important role in regulating the relations between union and management. Thus, the Industrial Disputes Act, 1947 seeks to ensure industrial peace. The principal objects of the Act are:

1) the promotion of measures for securing and preserving amity and good relations between the employer and workmen;

2) an investigation and settlement of industrial disputes, between employers and employees, employers and workmen, or workmen and workmen, with a right of representation by a registered trade union or a federation of associations of employers;

3) prevention of illegal strikes and lock-outs;

4) relief to workmen in the matter of lay-off and retrenchment; and

5) collective bargaining.

The Act primarily regulates the relations of employers and workmen. It draws a distinction between the workmen as such and the managerial or supervisory staff, and confers benefit on the former only.

It is necessary, therefore, to take the Act as a whole and examine its salient provisions. The long title shows that the object of the Act is "to make provisions for the investigation and settlement of industrial disputes, and for certain other purposes".

The Act extends to the whole of India, and is applicable to every "industry". It is, therefore necessary to know the definition of industry. Section 2 (f) defines "industry" to mean:

Any business, trade, undertaking, manufacture or calling of employers and includes any calling, service, employment, handicraft or industrial occupation or avocation of workmen.

The aforesaid definition raises an issue whether hospitals and dispensaries are industry.

3.4.2 Are Hospitals and Pharmacies Industry?

State of Bombay v. Hospital Mazdoor Sabha, (1960) ILLJ 251, constitutes a landmark in labour law. In this case the Supreme Court not only declined to adopt the expression "analogous to carrying out of a trade or business", but coined a new expression "systematically" organised in a business or trade like manner. In this case J.J. Group of Hospital (run by the State of Bombay) retrenched two of its ward servants. Against this order the aggrieved workers moved to the Bombay High Court for the issuance of writ of mandamus directing their reinstatement. The management i.e. the State of Bombay contended that the hospital being not an "industry" the Industrial Disputes Act, 1947 was not applicable. The Bombay High Court held that the hospital was an "industry". Aggrieved by this finding the State of Bombay filed an appeal before the Supreme Court. One of the main issues before the Supreme Court was whether in running the hospitals, the State was carrying an activity of an "industry". The Court answered it in affirmative:

> We have yet to decide which are attributes the presence of which makes an activity an undertaking within Section (j), on the ground that it is analogous to trade or business. It is difficult to state these possible attributes definitely or exhaustively; as a working principle it may be stated that an activity systematically or habitually undertaken for the production or distribution of goods or for the rendering of material services to the community at large or a part of such community with the help of employees is an undertaking. Such an activity generally involves the co-operation of the employer and the employees and its object is the satisfaction of material human needs. It must be organised or arranged in manner in which trade or business is generally organised or arranged. It must not be casual nor must it be for oneself nor for pleasure. Thus, the manner in which the activity in question is organised or arranged, the condition of the co-operation between employer and the employee necessary for its success and its object to render material service to the community can be regarded as some of the features which are distinctive of activities to which Section 2 (j) applies. Judged by this test there would be no difficulty in holding that the State is carrying on an undertaking when it runs the group of Hospitals in question.

In *Lalit Hari Ayurvedic College Pharmacy* v. *Workers Union,* AIR 1960 S.C. 126 the Supreme Court applied the ratio of *Hospital Mazdoor Sabha supra.* In this case Lalit Hari Ayurvedic College was an educational institute in Indian indigenous medicines. It was running a hospital for the practical training of its students and maintaining a pharmacy where its students got some training in the preparation and manufacture of medicines and organisation of Pharmacies. 30% of drugs produced by the Pharmacy were consumed in the hospital and 70%of drugs worth about Rs. one lakh per annum were sold in the market. The profits from the sale were apparently used in the maintenance of the college and its other non profitable activities. On these facts, it was held that the activity of the appellant in running the pharmacy and hospital was an "undertaking" under Section 2(j) of the Industrial Disputes Act, 1947.

However, a larger Bench of the Supreme Court in *Management of Safdarjung Hospital* v. *Kuldip Singh Sethi,* AIR 1970 SC 1407, disapproved the decision, in Hospital Mazdoor Sabha by holding that a hospital which was run and administered by the Government was a part of its sovereign functions and, therefore, it was outside the scope of "industry" and thereby unduly curtailed the scope of the term "industry". In this case three appeals were heard toegether.

In the first appeal a dispute arose between the management of Safdarjung Hospital, a Government owned and run hospital, and its employees for the computation of amount of salary due to workers consequent upon change in the grade. Thereupon the employees made an application to the Labour Court under Section 33 C (2) of the Industrial Disputes Act for the recovery of money due from the employer. The Labour Court directed the hospital to pay the money due to him. It is against this finding of the Labour Court that an appeal was filed.

In the second appeal a dispute arose between the Tuberculosis Association of India, (a research and training institution and its employees relating to pay scales and other facilities of the employees. The Government referred the dispute to the Tribunal. The Tribunal held that "neither the research carried out nor the training imparted nor the existence of Tuberculosis Association of India with which the hospital is affiliated makes any difference and the hospital is an industry within the meaning of the Act." Against this order the appeal was filed to the Supreme Court.

In the third appeal the management of Kurji Holy Family Hospital, Patna (a wholly charitable hospital maintaining some paid beds) took disciplinary action against two of its employees. The dispute was referred by the State of Bihar to Labour Court under Section 10 of the Act. The management raised the preliminary objection that they were not engaged in "industry" and consequently Labour Court had no jurisdiction. Against this a writ petition was made to the Patna High Court which held that it was an "industry". It was against this decision that an appeal was filed to the Supreme Court.

The common question involved in all the three appeals was whether the activities carried on by these hospitals were "industry"? The Court formulated the following test to determine whether or not an activity is an "industry":

i) It is not necessary to view the definition in two parts. 'The definition read as a whole denotes a collective enterprise in which employers and employees are associated. It does not exist either by the employers alone or by employees alone. It exists only when there is a relationship between employers and employees, the former engaged in business, trade, undertaking, manufacture or calling of employers and the latter engaged in any calling, service, employment, handicraft, or industrial occupation or, avocation

ii) The word "Industry" in (the definition of 'workmen') must take its colour from the definition (of industry) and discloses that a workman is to be regarded as one employed in an "industry" if he is following one of the vocations mentioned in conjunction with his employers engaged in the vocations mentioned in relation to the employers.

iii) ... in the collocation of the terms and their definitions these terms have a definite economic content of a particular type and on the authorities of this Court have been uniformly accepted as excluding professions and are only concerned with the production, distribution and consumption of wealth and the production and availability of material services. Industry has thus been accepted to mean only trade and business, manufacture, or undertaking analogous to trade or business for the production of material goods or wealth and material services.

iv) Material services are not services which depend wholly or largely upon the contribution of professional knowledge, skill or dexterity for the production of result. Such services... are services no doubt but not material services. Material services involve an activity carried on through co-operation between employers and employees to provide the community with the use of something such as electric power, water, transportation, mail delivery, and the like... the emphasis is... upon the productivity of a service organised as an industry and commercially valuable. It is the (commercial character of the activity and) the production of ... something (of benefit to particular individuals rendered by all services) which is described as the production of material services.

In the light of aforesaid test the court concluded that the *Hospital Mazdoor Sabha* wrongly held: (i) that the "second part of the definition contained an extension of the first part by including other items of industry", (ii) that economic activity was not an essential part of the concept of industry; (iii) that an economic activity could not exist without the presence of capital or profit making or both; (iv) that the test namely, "can such activity be carried on by private individuals or group of individuals," applied to the facts of the case.

The aforesaid principle was reiterated in *Management of Hospital, Orissa* v. *Their Workmen,* 1971 Lab. I.C. 835. In this case a dispute arose regarding the conditions of service of employees employed in hsopitals, sanatorium and infectious ward owned and run by the government. The Government of Orissa made three references to the Tribunal of adjudication. The Tribunal in all three cases held that the activities of the hospitals, sanatorium and infectious ward were "industry". Against this finding the management of the hospitals preferred an appeal before the Supreme Court. The question arose whether the aforesaid activities run by the government were "industry"? The Supreme Court following the decision in *Safdarjung Hospital* case held that the aforesaid activities were not "industry" because it was being run as a part of the functions of the Government and were being run as department. It further held that the "mere fact that payment was accepted in respect of some beds... could not... (lead) to the inference that the hospitals (were run as a business in a commercial way. Primarily, the hospitals (were) meant as free service by the Government to the patient, without any profit motive."

The principle enunciated in *Safdarjung Hospital supra* was once again followed and applied by the Supreme Court in *Dhanrajgiri Hospital* v. *Workmen,* (1975) 2LLJ 409. The hospital run by a Charitable Trust was engaged in imparting training in general nursing and midwifery. There were good number of trainees in general nursing and midwifery. There were also good number of trainees beds in the hospital meant for their practical training. The hospital was not distinct or separate from training nurses. The patients were charged according to their financial conditions and there was no

regular charge fixed for a patient. On these facts the Supreme Court held that the hospital was not engaged in any "industry" under the IDA.

The seven Judge bench of the Supreme Court in *Bangalore Water Supply and Sewerage Board* v. *Rajappa* after careful consideration of expressions used in the definition of 'industry', traditional attributes of trade or busines i.e. capital and profit motive, statements of International Labour Organisation in respect of industry, purposes and provisions of the legislation as a whole, Indian as well as foreign rulings, keeping in view the directive principles of State policy the following tests to determine the scope of "industry".

I. 'Industry', as defined in Section 2 (j) has a wide import.

   a) Where (i) systematic activity, (ii) organised by co-operation between employer and employee (the direct and substantial element is chimerical), (iii) for the production and/or distribution of goods and services calculated to satisfy human wants and wishes (not spiritual or religious but inclusive of material things or services geared to celestial bliss i.e., making, on a large scale *prasad* or food) *prima facie*, there is an industry in that enterprise.

   b) Absence of profit motive or gainful objective is irrelevant, be the venture in the public, joint, private or other sector.

   c) The true focus is functional and the decisive test is the nature of the activity with special emphasis on the employer-employee relations.

   d) If the organisation is a trade or business it does not cease to be one because of philanthrophy animating the undertaking.

II. Although Section 2 (j) uses words of the widest amplitude in its two limbs, their meaning cannot be magnified to overreach itself.

   a) 'Undertaking' must suffer a contextual and associational shrinkage as explained in Banerji and in this judgment; so also, service, calling and the like. This yields the inference that all organised activity possessing the triple elements in I (supra), although not trade or business, may still be 'industry' provided the nature of the activity, viz. the employer-employee basis, bears resemblance to what we find in trade or business. This takes into the fold 'industry' undertakings, calling and services, adventures 'analogous to the carrying on of trade or business'. All features, other than the methodology of carrying on the activity viz., in organising the co-operation between employer and employee, may be dissimilar. It does not matter, if on the employment of terms there is analogy.

III. Application of these guidelines should not stop short of their logical reach in invocation fo creeds, cults or inner sense of incongruity or outer sense of motivation for or resultant of the economic operations. The ideology of the Act being Industrial peace, regulation and resolution of industrial disputes between employer and workmen, the range of this statutory ideology must inform the reach of the statutory definition. Nothing less, nothing more.

   a) The consequences are (i) professions, (ii) clubs, (iii) educational institutions, (iv) co-operatives, (v) research institutes, (vi) charitable projects, and (vii) other kindred adventures, if they fulfil the triple tests listed in I (supra), cannot be exempted from the scope of Section 2 (j).

   b) A restricted category of professions, clubs, co-operatives and even gurukulas and little research labs, may qualify for exemption if, in simple ventures, substantially and going by the dominant nature criterion, substantively, no employees are entertained but in minimal matters, marginal employees are hired without destroying the non-employee character of the unit.

   c) If, in a pious or altruistic mission many employ themselves, free or for small honoraria or like return, mainly drawn by sharing in the prupose or cause, such as lawyers volunteering to run a free legal service, clinic or doctors serving in their spare hours in free medical centre or ashramites working at the bidding of the holiness, divinity or like central personality, and the services are supplied free or at nominal cost and those who serve are not

engaged for remuneration or on the basis of master and servant relationship, then, the institution is not an industry even in stray servants, manual or technical, are hired. Such elemosynary or like undertakings alone are exempt not other generosity, compassion, developmental passion or project.

IV. The dominant nature test:

a) Where a complex of activities, some of which qualify for exemption, others not, involves employees on the total undertaking, some of whom are not 'workmen' as in the *University of Delhi* case or some departments are not productive of goods and services if isolated, even then, the predominant nature of the services and the integrate nature of the departments as explained in the *Corporation of Nagpur*, will be the true test. The whole undertaking will be 'industry' although those who are not 'workmen' by definition may not benefit by the status.

b) Notwithstanding the previous clauses, sovereign functions, strictly, understood (alone) qualify for exemption, not the welfare activities or economic adventures undertaken by government or statutory bodies.

c) Even in departments discharging sovereign functions, if there are units which are industries and they are substantially severable, then they can be considered to come within Section 2 (j).

d) Constitutional and competently enacted legislative provisions may well remove from the scope of the Act categories which otherwise may be covered thereby.

On the basis of principles laid down in the case the Supreme Court has overruled the cases whose ratio runs counter to the principles enumerated in this case. However, the *State of Bombay* v. *Hospital Mazdoor Sabha* has been rehabilitated.

3.4.3 Coverage

The Industrial Disputes Act, 1947 covers all persons employed in any industry to do any skilled, or unskilled, manual, technical, operational, clerical or supervisory work are workmen within the meaning of this Act. It includes any apprentice. They may be employed for hire or reward and their contract of employment may be express or implied. It has been expressly provided that for the purposes of any proceeding under this Act such as conciliation proceedings etc. in relation to an industrial dispute it includes any such person who has been dismissed, discharged or retrenched in connection with or as a consequence of that industrial dispute or whose dismissal, discharge or retrenchment has led to that dispute. However, persons employed in managerial and administrative capacities and those employed in Army, Air Force, Navy, Police, Prison and Civil Service are excluded.

3.4.4 Industrial Dispute and Individual Dispute

The Industrial Dsiputes Act, 1947 seeks to resolve industrial disputes. Section 2 (k) of the Industrial Dsiputes Act, 1947, defines "industrial dispute" to mean:

> Any dispute or difference between employers and employers or between employers and workmen, or between workmen and workmen, which is connected with the employment or non-employment or the terms of employment or with the conditions of labour, of any person.
>
> The dimensions of the aforesaid definition determine the permissible area of both community intervention in industrial relations as well as labour activity.
>
> Stated broadly, the definition of "industrial dispute" contains two limitations (i) The adjective "Industrial" relates to the dispute of an industry as defined in the Act, and (ii) it expressly states that not all sorts of dispute and differences but only those which bear upon the relationship of employers and workmen regarding employment, non-employment, terms of employment and conditions of labour are contemplated.

The above definition covers only collective disputes or disputes supported by trade unions or by substantial number of workmen. In Section 2A which came into force on

1st December, 1965 it is provided that dispute or difference between an individual workman and his employer connected with or arising out of (i) discharge, (ii) dismissal, (iii) retrenchment, (iv) or otherwise termination of service of an individual workman, shall be deemed to be an "industrial dispute" even though no fellow workmen or any union of workmen is a party to the said dispute. The net effect of Section 2A is that by legislative action such a dispute is deemed to be an industrial dispute even where it is not espoused by a trade union or appreciable number of workmen. Thus, the result of the insertion of Section 2A was that, what was not an "industrial dispute" as per the interpretation of the Supreme Court would be deemed to be an "industrial dispute" in the stated circumstances.

3.4.5 Dispute Settlement Machinery

Under the Industrial Disputes Act, 1947 the following authorities are mentioned:

1) The Works Committee;
2) Conciliation Officer;
3) Board of Conciliation;
4) Courts of Enquiry
5) Labour Courts;
6) Industrial Tribunals; and
7) National Tribunals
8) Voluntary Arbitration

1) The Works Committee

In order to prevent industrial disputes the appropriate Government may, require the employer employing one hundred or more workmen in the industrial establishment on any day in the preceding twelve months to constitute a works committee. It consists of the representatives of the employer and workman in the establishment who is required to discuss the day to day matters in a cordial way. The duty of the works committee, according to section 3 is to promote measures for securing and preserving amity and good relations between the employer and his workmen. It can comment upon the matter of common interest. Its primary duty, therefore, is to prevent the disputes.

2) Conciliation Officer

The appropriate Government is empowered to appoint as many conciliation officers as it may think fit by a notification in the official Gazette. They shall be charged with the duty of mediating in and promoting the settlement of Industrial Dispute. A conciliation officer may be appointed for a specified area or for specified industries, in a specified area for one or more industries. He may be appointed for a limited period or permanently (Section 4). Where an Industrial Dispute exists or is apprehended conciliation officer may, and if a dispute relates to a public utility service, in which a notice of strike or lock-out has been given under Section 22, shall hold conciliation proceeding in the manner prescribed without any delay. He will investigate the dispute and all matters which may affect its merits. He may do all those things which he may think proper for inducing the parties to come to a fair, and amicable settlement of the dispute. He shall send a report to the appropriate Government if a settlement is arrived at. He shall send a memorandum of the settlement, duly signed by him and by the parties to the dispute. In the event of there being no settlement he shall forward a full account in the shape of a report to the appropriate Government giving details of the steps taken by him for bringing about a settlement thereof. He shall also state in his report the facts and circumstances and the reasons on account of which the parties could not come to a settlement. The report shall be submitted within fourteen days from the date of the commencement of the conciliation proceedings or within such shorter period as may be fixed by the appropriate Government. Such period may be extended by a written agreement between the parties. On receipt of such a report, the appropriate government may make a reference to a Board, Court or Tribunal. In the alternative, the Government shall record and communicate to the parties its reasons for not making a reference.

3) Board of Conciliation

The appropriate Government may by notification in the Official Gazette, constitute a Board of Conciliation for promoting the settlement of an industrial dispute (Section 5). The Board shall investigate the dispute and all matters affecting the matters and right settlement thereof. It may do all such things as it thinks fit for the purpose of inducing the parties to come to a fair and amicable settlement of the dispute. If a settlement is arrived at, the Board shall send a report to the appropriate Government, together with a memorandum of settlement, signed by the parties to the disputes. If a settlement could not be reached, the Board shall send a report to the appropriate Government, with full details of the steps taken by it and the facts and circumstances and the reasons why a settlement could not be arrived at. He shall also forward his recommendation for the settlement of the dispute. Such a report should be submitted within 2 months or within such shorter period as may be fixed by the Government. This time may be extended by the parties or by Government as and when necessary. On receipt of the report of the Board, the appropriate Government may make a reference to a Court or a Tribunal for enquiry and adjudication. If such a report of the Board is about a Public Utility Service, and the appropriate Government does not make a reference to a Labour Court, Tribunal or National Tribunal, it shall record its reasons and communicate them to the parties to the dispute.

4) Court of Inquiry

The appropriate Government may constitute a Court of Inquiry as occasion arises, for inquiring into any matter appearing to be connected with or relevant to an industrial dispute (Section 6). A Court of Inquiry shall inquire into the matters referred to it and report thereon to the appropriate Government ordinarily within a period of six months from the commencement of its inquiry (Section 14).

5) Labour Court—Constitution

Under Section 7 the appropriate government is empowered to constitute one or more Labour Court for the same area and in that case their powers and functions shall be determined by the appropriate government itself.

A Labour Court consists of one person who is known as the presiding officer of the Labour Court. A person is not qualified for appointment as the presiding officer of the Labour Court unless:

i) he is or has been a judge of the High Court, or

ii) has been for a period of not less than three years, been a district judge or an Additional District Judge; or

iii) he has held any judicial office in India for not less than seven years; or

iv) he has been the presiding officer of a Labour Court constituted under any Provincial Act or the State Act for not less than five years.

Jurisdiction, Powers and Functions

The Labour Court is required to

i) Adjudicate on industrial dispute relating to any matter specified in the second schedule.

ii) Perform such other functions as may be assigned to them under the Act.

iii) Adjudicate on matter incidental to the matters enumerated in the second schedule.

The matters specified in the second schedule are as follows:

1) Propriety or legality of an order passed by an employer under the standing orders.

2) The application and interpretation of standing orders.

3) Discharge or dismissal of workmen including reinstatement of or grant of relief to workmen wrongfully dismissed.

4) Withdrawal of any customary concession or privilege.

5) Illegality or otherwise of strike or lock-out; and

6) All matters other than those specified in the third schedule of the Act.

6) **Industrial Tribunal**

Under Section 7A of the appropriate government may by notification in the official Gazette constitute one or more Industrial Tribunals for the adjudication of disputes. A tribunal shall consist of one person only to be appointed by the appropriate government. An Industrial Tribunal may be appointed for a limited period on an ad hoc basis or permanently. A person is not qualified for appointment as the presiding officer of a Tribunal unless:

a) he is or has been a judge of a High Court, or

b) he has for a period of not less than three years been a District Judge or an Additional District Judge, or

c) he has been a presiding officer of a Labour Court for not less than five years, or

d) he has held an office not lower than that of an Assistant Labour Commissioner for not less than ten years and holds degree in law.

The Industrial Tribunal may be assisted, if the appropriate government may deem fit, by two persons to be known as assessors to advise the Tribunal in the proceeding before it.

Functions

The Industrial Tribunal exercises the following functions:

i) to adjudicate industrial disputes relating to any matter whether specified in the the third schedule of the Act.

ii) to adjudicate matters which are in the form of new demands giving rise to an industrial dispute affecting the working of the establishment and referred to it.

iii) to adjudicate upon matters incidental to the matters specified in the third schedule.

Matters mentioned in the third schedule:

i) Wages, including the period and mode of payment.

ii) Compensatory and other allowances.

iii) Hours of work and rest intervals.

iv) Leave with wages and holidays.

v) Bonus, profit sharing provident fund and gratuity.

vi) Shift working otherwise than in accordance with standing orders.

vii) Classification by grades.

viii) Rules of discipline.

ix) Rationalisation.

x) Retrenchment of workmen and closure of establishment; and

xi) Any other matter that may be prescribed.

Disqualification for the presiding officer of the Labour Courts or Industrial Tribunals:

No person can be appointed to or continue in the office of the presiding officer of a Labour Court or Tribunal if:

a) he is not an independent person;

b) he has attained the age of sixty five years

Powers of Labour Court and Tribunals: The Labour Courts and Tribunals are empowered to give relief to the aggrieved person in respect of matters enumerated in

the second or in the third schedule of the Act. For the purpose of giving relief these authorities can exercise the following powers:

i) it may follow such procedure as it may think fit;

ii) the presiding officer for the purpose may, after giving reasonable notice, enter the premises occupied by any establishment to which the dispute relates;

iii) it can exercise the powers of a civil court in respect of the following matters namely:

   a) enforcing the attendance of any person and examining him on oath

   b) compelling the production of documents and material objects

   c) issuing commissions for examination of witness

   d) in respect of such other matters as may be prescribed

iv) it can appoint assessor or assessors to advise it in the proceeding before it.

7) National Tribunal

The powers to constitute a National Tribunal vest only with the Central Government under Section 7 B. The pre-condition for constituting a National Tribunal are two namely: (i) the industrial dispute in question should involve questions of national importance and (ii) the industrial dispute should be of such nature that industrial establishments in more than one state are likely to be interested or affected by such dispute. When a reference is made under Section 10, sub-section (7A) to a National Tribunal, Labour Courts and Industrial Tribunals are barred from entertaining the disputes and if any such dispute is pending before any Labour Court or Tribunal shall be deemed to be quashed. Section 15 lays down that where an industrial dispute has been referred by the Central Government to a National Tribunal for adjudication, it shall hold its proceedings expeditiously and shall submit the award to appropriate government as soon as possible.

The National Tribunal is to consist of one person only to be appointed by the Central Government. Under sub-section (4) of section 7B the power has been given to Central Government in fit cases, to appoint two assessors to advise the National Tribunal in the proceedings before it.

Qualifications for Appointment as Presiding Officer: A person who is or has been a judge of a High Court is qualified to be appointed a presiding officer.

Disqualification: A person is disqualified to be appointed as presiding officer under Section 7C, if:

a) he is not an independent person; or

b) he has attained the age of sixty five years

8) Voluntary Arbitrator

Under Section 10 A the employer and employee may agree to refer before a voluntary arbitrator. But such reference must be made before a reference is made by the appropriate government to the Labour Court, Tribunal of National Tribunal.

3.5 STRIKES AND LOCK-OUTS

Strike is most important weapon in the hands of the workmen to force the employers to concede to their demands. It is a necessary safety value in industrial relations when properly resorted.

Section 2 (q) of the Industrial Disputes Act, 1947 defines strike to mean:

a) Cessation of work by a body of persons employed in any industry acting in combination; or

b) a concerted refusal of any number of persons who are or have been employed in industry to continue to work or to accept employment; or

c) a refusal under a common understanding of any number of persons who are or have been employed in industry to continue to work or to accept employment.

Lock-out: The expression 'lock-out' is defined in Section 2 (1) of the Act. It means the temporary closing of a place of establishment or the suspension of work or the refusal by the employer to continue to employ any number of persons employed by him.

The ingredients of a lock-out are:

i) temporary closing of a place of employment by the employer; or

ii) suspension of work by the employers; or

iii) refusal by an employer to continue to employ any number of person employed by him.

Prohibition on strikes and lock-out in public utility services

1) No person in a public utility service shall go on strike in breach of contract.

   a) without giving notice of strike to the employer as here in after provided within six weeks before striking; or

   b) within fourteen days of giving such notice; or

   c) before the expiry of the date of strike specified in any such notice as aforesaid; or

   d) during the pendency of any conciliation proceeding before a conciliation officer and seven days after the conclusion of such proceedings.

2) Similarly no employer carrying on any public utility service shall lock-out any of his workmen:

   a) without giving them notice of lock-out within six weeks before locking out; or

   b) within fourteen days of giving such notice; or

   c) before the expiry of the date of strike specified in any such notice as aforesaid; or

   d) during the tendency of any conciliation proceedings before a conciliation officer and seven days after the conclusion of such proceedings.

3) But no notice of strike or lock-out shall be necessary where there is in existence a lock-out or strike in the public utility service establishment. But the employer shall

send intimation of such lock-out or strike on the day on which it is declared to such authority as may be specified by the appropriate Government.

4) The notice of strike or lock-out should be given by such number of persons to such person or persons and in such manner as may be specified by the appropriate Government.

5) If on any day an employer receives from any person employed by him any such notices or gives to any persons employed by him any such notices, he shall within five days thereof report to the appropriate Government or to such authority as that Government any prescribe the number of such notices received or given on that day.

The conditions specified in Section 22 are mandatory and non-observance of them will render the strike or lock-out illegal.

General prohibition on strike or lock-out (Section 23)

No workman employed in any industrial establishment shall go on strike in breach of contract and no employer of any such workman shall declare a lock-out:

a) during the pendency of conciliation proceedings before a conciliation Board and seven days after the conclusin of such proceedings;

b) during the pendency of proceedings before a Labour Court Tribunal or National Tribunal and two months after the conclusion of such proceedings;

c) during the arbitration proceedings before an arbitrator and two months after the conclusion of such proceedings where a notification has been issued under section 10A (3A); or

d) during any period in which a settlement or award is in operation in respect of any of the matters covered by the settlement or award.

The prohibitions mentioned in Section 23 are applicable to all the industrial establishments whether it is a public utility service or otherwise.

Illegality of strike and lock-out (Section 24)

A strike or lock-out is illegal if:

1) i) it is commenced or declared in contravention of Section 22 or Section 23; or

ii) it is continued in contravention of an order made under sub-section (3) of Section 10 or sub-section (4A) of Section 10A.

2) Where a strike or lock-out in pursuance of an industrial dispute has already commenced and is in existence at the time of reference of the dispute to a Board, an Arbitrator. Labour Court, Tribunal or National Tribunal, the continuance of such strike or lock-out shall not be deemed to be illegal provided that such strike or lock-out was not at its commencement in contravention of the provisions of the Industrial Disputes Act or the continuance there of was not prohibited under sub-section (3) of Section 10 or sub-section (4A) of Section 10A.

A lock-out declared in consequence of an illegal strike or a strike declared in consequence of an illegal lock-out shall not be deemed to be illegal.

Prohibition of financial aid to illegal strikes and lock-out

No person shall knowingly expend or apply any money in direct furtherance or support of any illegal strike or lock-out (Section 25).

Punishment for illegal strike or lock out

1) i) Any workman who commences, continues or otherwise acts in direct furtherance of an illegal strike shall be punishable with imprisonment, which may extend to one month or with fine which may extend to fifty rupees or with both;

ii) Any employer who commences, continues or otherwise acts in furtherance of

an illegal lock-out shall be punishable with imprisonment for a term which may extend to one month or with a fine which may extend to one thousand rupees or with both (Section 26).

2) Any person who instigates or incites others to take part in or acts in furtherance of a strike or lock-out which is illegal under this Act shall be punishable with imprisonment for a term which may extend to six months or with a fine which may extend to one thousand rupees or with both (Section 27).

3) Any person who knowingly expends or applies any money in direct furtherance or support of any illegal strike or lock-out shall be punishable with imprisonment or a term which may extend to six months or with a fine which may extend to one thousand rupees or with both (Section 28).

3.6 TERMINATION OF SERVICE AND DOMESTIC ENQUIRY

3.6.1 General

Under the common law an employer had a right to discharge or dismiss an employee, or what is popularly known in some countries as the right to "hire and fire". This right has been subjected to statutory restrictions and judicial decisions. There are three accepted fundamental principles, namely, (1) that an industrial worker must be placed in such a position that the security of his service may not depend upon the caprice or arbitrary will of the employer, (2) that industrial peace should be maintained, and (3) that industry should be efficiently managed. These principles underlie the Industrial Employment (Standing Order) Act, 1946, the Industrial Disputes Act, 1947 and other local statutes of a like nature. The former Act makes it obligatory on employers of large establishments employing 100 workers or more to have standing orders following a model pattern certified by the appropriate authority. They are to be regarded as conditions of service by which both employers and employees are to be governed. When the services of an industrial worker are terminated an industrial dispute can be raised under the Industrial Disputes Act, for it would be a question of "employment and non-employment" and it would be competent for the industrial tribunal to determine whether the termination of service is justified.

3.6.2 Statutory Protection

The Model Standing Orders under Schedule-I of the Industrial Employment (Standing Order) Central Rules, 1946 of *inter alia*, regulates termination of employment.

1) For terminating employment of a permanent workman, notice in writing shall be given either by the employer or the workman—one month notice in the case of monthly rated workmen and two weeks notice in the case of other workmen; one

month or two weeks pay, as the case may be, may be paid in lieu of notice.

2) No temporary workman whether monthly rated, weekly rated or piece-rated and non probationer or badli shall be entailed to any notice or pay in lieu thereof if his services are terminated, but the services of a temporary workman shall not be terminated as a punishment unless he has been given an opportunity of explaining the charges of misconduct alleged against him in the manner prescribed in paragraph 14.

3) Where the employment of any workman is terminated, the wages earned by him and other dues, if any, shall be paid before the expiry of the second working day from the day on which his employment is terminated.

Disciplinary action for misconduct

1) A workman may be fined up to two per cent of his wages in a month for the following acts and omissions, namely: (The form here leaves blanks to be filled).

2) A workman may be suspended for a period not exceeding four days at a time, or dismissed without notice or any compensation in lieu of notice, if he is found to be guilty of misconduct.

3) The following acts and omissions shall be treated as misconduct:

   a) Willful insubordination or disobedience, whether alone or in combination with others, to any lawful and reasonable order of a superior,

   b) Theft, fraud, or dishonesty in connection with the employer's business or property.

   c) Willful damage to or loss of employer's goods or property,

   d) Taken or giving bribes or any illegal gratification,

   e) Habitual absence without leave, or absence without leave for more than 10 days,

   f) Habitual late attendance,

   g) Habitual breach of any law applicable to the establishment,

   h) Riotous or disorderly behaviour during working hours at the establishment or any act subversive of discipline,

   i) Habitual negligence or neglect of work,

   j) Frequent repetition of any act or omission for which a fine may be imposed to a maximum of 2 per cent of the wages in a month (see 14 (I) above).

   k) Striking work or inciting other to strike work in contravention of the provision of any law, or rule having the force of law.

4) a) Where a disciplinary proceeding against a workman is contemplated or is pending or where criminal proceedings against him in respect of any offence are under investigation or trial and the employer is satisfied that it is necessary or desirable to place the workman under suspension, he may, by order in writing suspend him with effect from such date as may be specified in the order. A statement setting out in detail the reason for such suspension shall be supplied to setting out in detail the reasons for such suspension shall be supplied to the workman within a week from the date of suspension.

   b) A workman who is placed under suspension shall be paid subsistence in accordance with the provisions of Section 10A of the Act.

      ba) In the inquiry, the workman shall be entitled to appear in person or to be represented by an office-bearer of a trade union of which he is a member.

      bb) The proceedings of the inquiry shall be recorded in Hindi or in English or in the language of the state where the industrial establishment is located, whichever is preferred by the workman.

      bc) The proceedings of the inquiry shall be completed within a period of three months.

Provided that the period of three months may, for reasons to be recorded in writing, be extended by such further period as may be deemed necessary by the inquiry officer.

c) If on the conclusion of the inquiry or, as the case may be, of the criminal proceedings, the workman has been found guilty of the charges framed against him and it is considered, after giving the workman concerned a reasonable opportunity of making representation on the penalty proposed, that an order of dismissal or suspension or fine or stoppage of annual increment or reduction in rank would meet the ends of justice, the employer shall pass an order accordingly.

Provided that when an order of dismissal is passed under this clause the workman shall be deemed to have been absent from duty during the period of suspension and shall not be entitled to any remuneration for such period, and the subsistence allowance already paid to him shall be recovered:

Provided further that where the period between the date on which the workman was suspended from duty pending the inquiry or investigation or trial and the date on which an order of suspension was passed under this clause exceeds four days, the workman shall be deemed to have been suspended only for four days, or for such shorter period as is specified in the said order of suspension and for the remaining period he shall be entitled to the same wages as he would have received if he had not been placed under suspension, after deducing the subsistence allowance paid to him for such period.

Provided also that where an order imposing fine or stoppage of annual increment or reduction in rank is passed under this clause, the workman shall be deemed to have been on duty during the period of suspension and shall be entitled to the same wages as he would have received if he had not been placed under suspension, after deducting the subsistence allowance paid to him for such period.

Provided also that in the case of a workman to whom the provisions of clause (2) or Article 311 of the Constitution apply, the provision of that article shall be complied with.

d) If on the conclusion of the inquiry, or as the case may be, of the criminal proceedings, the workman has been found to be not guilty of any of the charges framed against him, he shall be deemed to have been on duty during the period of suspension and shall be entitled to the same wages as he would have received if he had not been placed under suspension after deducting the subsistence allowance paid to him for such period.

e) The payment of subsistence allowance under this standing order shall be subject to the workman concerned not taking up any employment during the period of suspension.

5) In awarding punishment under this standing order, the authority imposing the punishment shall take into account any gravity or the misconduct, the previous record, if any, of the workman and any other extenuating or aggravating circumstances, that may exist. A copy of the order passed by authority imposing the punishment shall be supplied to the workman concerned.

6) A workman aggrieved by an order imposing punishment may within twenty one days from the date of receipt of the order, appeal to the appellate authority.

Industrial Disputes Act, 1947

Under Section 11A of the Act the Tribunal has power in cases wherever necessary to set aside the order of discharge or dismissal and direct reinstatement of the workman on such terms and conditions, if any, as it thinks fit or give such other relief to the workman including the award of any lesser punishment in lieu of discharge or dismissal as the circumstance of the case may require. The Supreme Court while delineating the contour of Section 11A laid down the following principles to regulate the management's power to take disciplinary action.

1) The right to take disciplinary action and to decide upon the quantum of punishment are mainly managerial functions, but if a dispute is referred to a tribunal, the latter has power to see if action of the employer is justified.

2) Before imposing the punishment, an employer is expected to conduct a proper enquiry in accordance with the provisions of the Standing Orders, if applicable, and principles of natural justice. The enquiry should not be an empty formality.

3) When a proper enquiry has been held by an employer, and the finding of misconduct is plausible flowing from the evidence adduced at the said enquiry, the Tribunal has no jurisdiction to sit in judgement over the decision of the employer as an appellate body. The interference with the decision of the employer will be justified only when the findings arrived at in the enquiry are perverse or the management is guilty of victimisation, unfair labour practice or mala fide.

4) Even if no enquiry has been held by an employer or if the enquiry held by him is found to be directive, the Tribunal in order to satisfy itself about the legality and validity of the order, had to give an opportunity to the employer and employee to adduce evidence before it. It is open to the employer to adduce evidence for the first time justifying his action, and it is open to the employee to adduce evidence contra.

5) The effect of an employer not holding an enquiry is that the Tribunal would not have to consider only where there was a prima facie case. On the other hand, the issue about the merits of the impugned order of dismissal or discharge is at large before the tribunal and the latter, on the evidence adduced before it, has to decide for itself whether the misconduct alleged is proved. In such cases, the point about the exercise or managerial functions does not arise at all. A case of defective enquiry stands on the same footing as no enquiry.

6) The Tribunal gets jurisdiction to consider the evidence placed before it for the first time in justification of the action taken only, if no enquiry has been held or after the enquiry conducted by an employer found to be defective.

7) It has never been recognised that the Tribunal should straight away, without anything more, direct reinstatement or a dismissed or discharge employee, once it is found that no domestic enquiry has been held or the said enquiry is found to be defective.

8) An employer, who wants to avail himself of the opportunity of adducing evidence for the first time before the Tribunal to justify his action, should ask for it at the appropriate stage. If such an opportunity is asked for, the Tribunal has no power to refuse. The giving of an opportunity to an employer to adduce evidence for the first time before the Tribunal is in the interest of both the management and the employee and to enable the Tribunal itself to be satisfied about the alleged misconduct.

9) Once the misconduct is proved either in the enquiry conducted by an employer or by the evidence placed before a Tribunal for the first time, punishment imposed cannot be interfered with by the Tribunal except in cases where the punishment is so harsh as to suggest victimisation.

10) In a particular case, after setting aside the order of dismissal whether a workman should be reinstated or paid compensation is, as held by this court in the management of Panitole Tea Estate vs. The Workmen, 1971-I SCC 742 = (AIR 1971 SC 2171) within the judicial decision of a Labour Court or Tribunal.

3.7 SEXUAL HARASSMENT OF WOMEN AT WORK PLACE

With the increasing awareness and emphasis on gender justice, there is increase in the effort to guard against such violations and the resentment towards incidents of sexual harassment is also increasing.

In Vishake v State of Rajasthan, 1992 LLR 991, the Supreme Court not only explained the concept of sexual harassment but laid down the following guidelines to be observed by the employers in work places as well as other responsible persons or institutions to ensure prevention of sexual harassment of women. According to the Court the fundamental right to carry on any occupation, trade or profession depends on the availability of a safe working environment. Right to life means life with dignity. The primary responsibility for ensuring such safety and dignity through suitable legislation, and the creation of a mechanism for its enforcement, is of the legislature and the executive. When however, instance of sexual harassment resulting in violation of fundamental rights of women workers under Article 14, 19 and 21 of the Constitution are brought before us for redress under Article 32 of the Constitution an effective redressal requires that some guidelines should be laid down for the protection of these rights to fill the legislative vacuum. It is necessary and expedient for employers in work places as well as other responsible persons or institutions to observe certain guidelines to ensure the prevention of sexual harassment of women.

Duty of the employer or other responsible persons in work places and other institutions

The Supreme Court ruled that it shall be the duty of the employer or other responsible persons in work places or other institutions to prevent or deter the commission of acts of sexual harassment and to provide the procedures for the resolution, settlement or prosecution of acts of sexual harassment by taking all steps required.

While dealing with the third party harassment the court held that where sexual harassment occurs as a result of an act or omission by any third party or outsider, the employer and person in charge will take all steps necessary and reasonable to assist the affected person in terms of support and prevention action.

3.8 LET US SUM UP

From the above study, you may draw several conclusions. The Trade Unions Act, 1926, Industrial Disputes Act, 1947 and the Industrial Employment (Standing Orders) Act, 1946 seek to regulate the union and management relations. Further the judicial decisions seek to prevent sexual harassment of women workers.

Srivastava, S.C. (2000), *Industrial Relations and Labour Law*, 4th ed., Vikas Publishing House: New Delhi.

UNIT 4 WAGE AND SALARY ADMINISTRATION

Structure

4.0 OBJECTIVES

After reading this unit you should be able to:

- explain the concept of minimum wage, fair wage and living wage and make a distinction between them;
- define and explain the meaning c wages under different labour legislation;
- define wage period, identify the persons responsible for payment of wages and enumerate the deductions authorised under the Payment of Wages Act;

- describe the procedure for fixation of minimum wage and the effect of non-payment or less payment;
- explain the scope and coverage of the payment of bonus, set-off and set on and describe the method for determination of bonus; and
- describe the duties of employer to pay equal remuneration for men and women for same work or work of similar nature and also not to make discrimination while recruiting men and women workers.

4.1 INTRODUCTION

In the previous units you have studied the law relating to the management of welfare, health and medical facilities and the union and management relations. In this Unit you will study wage and salary administration. For a better salary administration it is necessary that the payment should be made at regular intervals and without any arbitrary deductions. Further there should be no discrimination between men and women in respect to wages paid to them for equal work. Quite apart from this law must ensure minimum standards in respect to wages. To meet this situation the law regulates these aspects. It is, therefore, necessary to enforce and administer the law and the minimum standards laid down in this regard.

4.2 EVOLUTION OF WAGE CONCEPTS

Broadly speaking, wages have been classified into six broad categories:

i) Statutory minimum wage

ii) Bare subsistence or minimum wage

iii) Living wage

iv) Fair wage

v) Minimum wage

vi) Need-based minimum wage

The statutory minimum wage is determined according to the provisions of the Minimum Wages Act, 1948, Category (ii) is the innovation of the Indian Judiciary, Categories (iii), (iv) and (v) have been introduced in the Report of the Committee on Fair Wages, Category (vi), i.e. need-based minimum wage has emerged from the Resolution of the 15th Session of the Indian Labour Conference. Let us discuss each of these in some detail.

4.2.1 The Statutory Minimum Wage

The Minimum Wages Act, 1948 does not define the expression minimum wage. The statutory minimum wage, however, is the minimum wage, providing for some measure of education, medical requirements and amenities.

4.2.2 The Bare Subsistence or Minimum Wage

The bare minimum wage is a "wage which would be sufficient to cover the bare physical needs of the worker and his family i.e. a rate which has got to be paid to the workers irrespective of the capacity of the industry to pay".

4.2.3 The Concept of Living Wage

The concept of the living wage which has influenced the fixation of wages in all economically advanced countries is an old and well-established one. But most of the current definitions are of recent origin. The most expressive definition of the living wage is that of Justice Higgins of the Australian Commonwealth Court of Conciliation in the Harvester case. He defined the living wage as one appropriate for the "normal

needs of the average employee, regarded as a human being living in a civilised community".

Article 43 of the Indian Constitution has also adopted the following as one of the Directive Principles of State Policy:

> The state shall endeavour to secure, by suitable legislation or economic organisation or in any other way, to all workers, agricultural, industrial or otherwise, work, a living wage, conditions of work ensuring a decent standard of life and full enjoyment of leisure and social and cultural opportunities.

This is the ideal to which the workers are hopefully looking forward to achieve.

In *All Indian Bank Employees Association* v. *Reserve Bank of India,* (1965) 2 L.L.J. 175 (S.C.), Hidayatullah, J. observed:

> Our political aim is living wage though in actual practice living wage has been an ideal, which has eluded out efforts like an ever receding horizon and will so remain for some time. Our general wage structure has at best reached the lower levels of fair wage though some employers are paying much higher wages than the general average.

4.2.4 Fair Wage

Fair wage is the mean between the living wage and the minimum wage. Said the Committee on Fair wages:

> While the lower limit of the fair wage must obviously be the minimum wage, the upper limit is equally set by what may broadly be called the capacity of industry to pay. This will depend not only on the present economic position of the industry but on its future prospects. Between these two limits the actual wage will depend on (i) the productivity of labour, (ii) the prevailing rates of wages in the same or similar occupation in the same or neighbouring localities, (iii) the level of the national income and its distribution, and (iv) the place of the industry in the economy of the country.

In *Kamani Metals and Alloys Ltd* v. *Their Workmen*, the Supreme Court observed that fair wage lies between the minimum wage which must be paid in any event, and the living wage which is the goal.

4.2.5 Minimum Wage

The Committee on Fair Wages expressed the view that the minimum wage must provide not merely for the subsistence of life, but for the preservation of the efficiency of the worker. For this purpose, the minimum wage must also provide for some measure of education, medical requirements and amenities. The committee also stated that an industry which was incapable of paying this minimum wage had no right to exist and for fixing the minimum wage, no regard should be paid to the capacity of the industry to pay and it should be based on the requirements of the worker and his family.

In *Hydro (Engineers) Pvt. Ltd.* v. *Their Workmen*, the Supreme Court, while upholding the findings of the Committee observed that the minimum wage rates must ensure not only the mere physical needs of the worker and those of his family but also preserve his efficiency as a workman.

4.2.6 Need-based Minimum Wage

According to 15th Indian Labour Conference (July, 1957), the need-based minimum wage "should ensure the minimum human needs" of the industrial worker, irrespective of any other consideration. The Fair Wage Committee adopted the following norms for the calculation of "need-based wage for industrial labour" which should guide all wage fixing authorities:

i) In calculating the minimum wage, the standard working class family should be

taken to consist of 3 consumption units for one earner; the earnings of women, children and adolescents should be discared.

ii) Minimum food requirements should be calculated on the basis of a net intake of 2,700 calories, as recommended by Dr. Aykroyd for an average Indian adult of moderate activity.

iii) Clothing requirements should be estimated at a per capita consumption of 18 yards per annum which would give for the average worker's family of four, a total of 72 yards.

iv) In respect of housing, the norms should be the minimum rent charged by Government in an area for houses provided under the Subsidised Industrial Housing Scheme for Low Income Groups.

v) Fuel, lighting and other 'miscellaneous' items of Expenditure should constitute 20 per cent of the total minimum wage.

Of these, point (ii) referring to the nutritional requirements in the aforesaid norms has been the subject of much controversy.

In *Workmen* v. *Management of Reptakas Brett & Co.* the Supreme Court observed:

> The concept of "minimum wage" is no longer the same as it was in 1936. Even 1957 is way behind, a worker's wage is no longer a contract between an employer and an employee. It has the force of collective bargaining under the labour laws. Each category of the wage structure has to be tested at the anvil of social justice which is the live fibre of our society today. Keeping in view the socio-economic aspect of the wage structure, we are of the view that it is necessary to add the following additional component as a guide for fixing the minimum wage in the industry:
>
> (iv) Children education, medical requirement, minimum recreation including festivals/ceremonies and provision for old age, marriages etc. should further constitute 25% of the total minimum wage.

The Court added:

> The wage structure which approximately answers the above six components is nothing more than a minimum wage at all times and under all circumstances. An employer who cannot pay the minimum wage has no right to engage labour and no justification to run the industry.

4.3 PAYMENT OF WAGES ACT, 1936

4.3.1 Purpose of the Act

The object of the Act is to eliminate all avoidable delays in the payment of wages to workmen within the meaning of this Act and to protect them from unlawful deductions in the payment of their wages.

4.3.2 Applicability of the Act

The Payment of Wages Act applies to the persons mentioned hereunder:

a) persons employed in a factory

b) persons employed otherwise than a factory

c) persons employed upon any Railway by Railway administration, either directly or through a sub-contractor fulfilling a contract with Railway administation.

d) persons employed in an industrial or other establishment specified in sub-classes (a) to (g) of clause (ii) of Section 2.

4.3.3 Definition of Wages

Section 2 (vi) of the Payment of Wages Act, 1936 defines "wages" as all remuneration, including salary, allowance, or otherwise expressed in terms of money or capable of being so expressed, which would, if the terms employment express or implied were fulfilled, be payable to a person employed in respect of his employment, and includes:

a) any remuneration to which the person employed is entitled in respect of overtime work or holidays or any leave period;

b) any remuneration payable under any award of settlement between the parties or order of Court;

c) any additional remuneration payable under the terms of employment (whether called a bonus) or by any other name;

d) any sum which by reason of the termination of employment of the person employed is payable under any law, contract or instrument which provides for the payment of such sum, whether with or without deductions, but does not provide for the time withint which the payment is to be made;

e) any sum to which the person employed is entitled under any scheme framed under any law for the time being in force.

But the sums mentioned hereunder shall not include:

i) any bonus (whether under a scheme of profit sharing or otherwise) which does not form part of the remuneration payable under the terms of employment or which is not payable under any award or settlement between the parties or order of a Court;

ii) the value of any house accommodation, or of supply of light, water, medical attendance, or other amenity or of any service excluded from the computation of wages by a general or special order of the State Government;

iii) any contribution paid by the employer to any pension or provident fund, and the interest which may have accured there on;

v) any sum paid to the employed person to defray special expenses entailed on him by the nature of his employment; or

vi) any gratuity payable on the termination of employment in cases other than specified in sub-clause (d).

4.3.4 Responsibility for Payment of Wages

The Act imposes an obligation on every employer to make payment of all wages required to be paid under this Act to persons employed by him. In addition, for person employed (otherwise than by a contractor), the following persons so named, nominated, or responsible to the employer, jointly and severally, are responsible for such payment:

i) In factories the person named as manager

ii) In industrial or other establishments the person who is responsible to the employer for the supervision and control of the industrial or other establishment.

iii) In railways (otherwise than in factories) the person who has been so nominated in this behalf for the local area concerned by the railway administration.

4.3.5 Wage Period

Section 4 of the Payment of Wages Act, 1936 provides that every person responsible for the payment of wages under Section 3 of the Act shall fix wage periods in respect of which such wages shall be paid. Wage period may be fixed as payable daily, weekly, fortnightly or monthly. Employer is bound to fix wage periods. No wage period shall exceed one month.

4.3.6 Time of Payment of Wages

Section 5 lays down the rules as to the time of payment of wages. The payment must be made at regular intervals. Every person employed upon or in:

a) any railway, factory, or industrial or other establishments or in which there are less than one thousand employees, the wages shall be paid before the expiry of the seventh day; and

b) any other railway, factory or industrial or other establishment shall be paid before expiry of the tenth day after the last day of the wage period in respect of which the wages are payable.

In the case of persons employed on a dock, wharf, or jetty, or in a mine, the balance of wages found due on completion of the final tonnage account of the ship or wage loaded or unloaded, as the case may be, shall be paid before the expiry of the seventh day from the day of such completion.

Where the employment of any person is terms by or on behalf of the employer, the wages earned by him be paid before the expiry of the second working day from the day on which his employment is terminated.

Where the employment of any person in an establishment is terminated due to the closure of the establishment for any reason other than a weekly or the recognised holiday, the wages earned by him shall be paid before the expiry of the second day from the day on which his employment is so terminated.

Under Section 5(3), the State Government may, subject to such condition as specified and to such extent as may be specified in the order, exempt the person responsible for the payment of wages to the person employed upon any railway, (otherwise than a factory), or persons employed as daily rate in the Public Works Department of the Central/State Government.

4.3.7 Mode of Payment

Section 6 lays down that all wages shall be paid in current coins or currency notes or in both. The employer may, after obtaining the written authorisation of the employed person, pay the wages whether by cheque or by crediting the wages in his bank account.

4.3.8 Deduction

Every payment made by the employed person to the employer or his agent shall be deemed to be a "deduction" for the purpose of this Act, as is made clear by Explanation I to Section 7. Reduction of wages on account of change in lower cadre would amount to deduction of wages.

According to Explanation II to Section 7, the penalties mentioned hereunder are not deductions if imposed for good and sufficient cause:

a) the witholding of increment or promotion including the stoppage of the increment at an efficiency bar;

b) the reduction to a lower post or time-scale or to a lower stage in a time scale or

c) suspension

4.3.9 Deductions Which May be Made From Wages

Section 7 of the Act provides that deductions from the wages of an employed person shall be made only in accordance with the provisions of this Act and may be of the following kinds only namely:

a) fines

b) deductions for absence from duty

c) deductions for damages to or loss of goods expressly entrusted to the employed person for custody or for loss of money for which he is required to account where such damage or loss is directly attributable to his neglect or default.

d) deductions for house accommodation supplied by the employer.

e) deductions for amenities and service supplied by the employer.

f) deduction for recovery of advances of whatever nature and the interest due in respect thereof or for adjustment of over payment of wages.

g) deductions for recovery of loans and interest due in respect thereof.

h) deductions for recovery of loans granted for house building and the interest due in respect thereof.

i) deductions of Income Tax payable by the employed person.

j) deductions required to be made by order of a Court or other competent authority.

k) deductions for subscription to and for payment of advances from any provident fund.

l) deduction for payment to co-operative societies or to scheme of Insurance maintained by the Indian Post Office.

m) deductions made for payment of any premium on the Life Insurance Policy to the Life Insurance Corporation of India.

n) deductions made, with the written authorisation of employed person for the payment of employees contribution to any fund constituted for the welfare of the employed persons or the members of their families or both.

o) deductions made, with the written authorisation for payment of the fees payable by the employee for the membership of any trade union registered under the Trade Union Act, 1926.

p) deductions for payment of insurance premium on fidelity Guarantee Bonds.

q) deductions for recovery of losses sustained by a railway administration on account of acceptance by the employed person of counterfiet or base coins mutilated or forged.

r) deductions for recovery of losses sustained by the railway administration on account of the failure of the employed person to invoice, to bill, to collect or to account for the appropriate charges due to that administration in respect of fares, freight, demurrage wherfage and Carnage or in respect of sale of goods in catering establishments or in respect of commodities in grainshops or otherwise.

s) deductions for recovery of losses sustained by a railway administration on account of any rebates or refunds is correctly attributable to his neglect or default.

t) deductions made for contribution to the Prime Minister's National Relief Fund or to such other fund with the written authorisation of the employed person.

u) deductions for contribution to any insurance scheme framed by the Central Government for the benefit of its employees.

4.3.10 Limit on Total Amount of Deduction

Section 7 (3) provides that the total amount of deduction which may be made in any wage period from the wage of an employed person shall not exceed:

i) 75% of such wages where such deductions are wholly or partly made for payment to co-operative societies

ii) in any other case, 50% of such wages.

Where, however, total deductions authorised under the section exceeds 75% as the case may, the excess may be recovered in such manner as may be prescribed.

4.4 MINIMUM WAGE

4.4.1 Object

The Minimum Wages Act was enacted in the year 1948 to give effect to the recommendation adopted by the International Labour Conference in the year 1928. The fixation of minimum rates of wages is directed against exploitation of the ignorant, less organised and less privileged members of the society by the capitalist class. The anxiety on the party of the society to improve the general economic conditions of some of its less favoured members has resulted in enactment of the Minimum Wages Act, 1948.

4.4.2 Scope and Coverage

The Minimum Wages Act, 1948 extends to the whole of India. However, under Section 3 (1), the appropriate Government fixes the minimum rates of wages payable to workers employed in job specified in Part I or Part II of the Schedule and in any other employment added to wither part by notification under Section 27.

The employments are listed in Parts I and II of the Schedule appended to the Act which are as follows:

Employment in any:

1) Woolen carpet making or shawl weaving establishment;
2) Rice mill, flour mill or dal mill.
3) Tobacco (including bidi-making) manufacturing.
4) Plantation, that is to say, any estate which is maintained for the purpose of growing cincona, rubber, tea, or coffee.
5) Oil mill
6) Lac manufacturing
7) Mica works
8) Public motor transport
9) Tanneries and leather manufacturing
10) Employment under any local authority
11) Employment on the construction and maintenance of roads or in building operations
12) Employment in stone-breaking or stone-crushing
13) Employment in the mines of: (i) Gypsum, (ii) Barytes, (iii) Bauxite, (iv) Manganese, (v) China clay, (vi) Kyanite and, (vii) Mangnesite.

Part II of the Schedule includes employment in agriculture, that is to say, in any farming, including the cultivation and tillage of the soil, dairy-farming production, cultivation, growing and harvesting of any agricultural or horticultural commodity, the raising of live-stock; bees and poultry, and any practice performed by a farmer or on farm as incidental to or in conjunction with farm operations including any forestory or

timbering operations and the preparation for market any delivery to storage or to market or to carriage for transportation to market or farm produce.

4.4.3 Definition of Wages

The Minimum Wages Act does not define the term "minimum wage". However Section 2(b), defines "wages" mean all remuneration capable of being expressed in terms of money, which would, if the terms of the contract of employment express or implied were fulfilled, be payable to a person employed in respect of his employment or of work done in such employment and include:

i) the value of:

   a) Any house accommodation, supply of light, water, medical attendance, or

   b) Any other amenity or any service excluded by general or special order of the appropriate Government.

ii) Any contribution paid by the employer to any Pension Fund or Provident Fund or under any scheme of social insurance.

iii) Any travelling allowance of the value of any travelling concession.

iv) Any sum paid to the person employed to defray special expenses entailed upon him by the nature of his employment; or

v) Gratuity payable on discharge.

Fixation of minimum rates of wages

Section 3 lays down the provisions with respect to fixation of wages. The appropriate Government shall fix the minimum rates of wages payable to the employees employed in an employment specified in Part II of the Schedule and in an employment added to either part by notification under Section 27.

But regarding employees employed in an employment specified in Part II of the Schedule, the appropriate Government may instead of fixing minimum rates of wages under Section 3 (1) (a) for the whole state, fix such rates for a part of the state or for any specified class or classes of such employment in the whole of the state or any part thereof.

Review and Revision: The minimum rates of wages so fixed shall be reviewed by the appropriate Government at such intervals as it may think fit. Such intervals shall not exceed five years. However if the appropriate Government has not reviewed or revised the minimum rates within a period of five years, it may do so after the expiry of the said period of five years.

Sub-section (2) of Section 3 provides that the appropriate Government may fix:

i) a minimum rates of wages for time-work, to be known as minimum time rate;

ii) a minimum rate of wages for piece-work to be known as a minimum piece-rate;

iii) a minimum rate of remuneration to apply in the case of employees employed on piece-work for the purpose of securing to such employees a minimum rate of wages on a time work basis to be known as "guranteed time-rate".

iv) a minimum rate to apply in substitution for minimum rate which would otherwise be applicable in respect of overtime work done by employees, to be known as "overtime rate".

Section 3 (2-A) lays down that the fixed or revised rates of wages shall not apply to any of the cases mentioned here under when either the dispute is pending or an award by the tribunal is in operation:

i) Where a dispute in respect of rates of wages is pending before a Tribunal or National Tribunal under the Industrial Disputes Act or before any like authority under any other law; or

ii) Where such a Tribunal has made an award which is in operation.

From this it appears that an Industrial Tribunal is not bound by the fixation or revision of minimum rates of wages by the Government during the pendency of proceedings before it.

Section 3 (3) provides that in fixing and revising minimum rates of wages, different rates of wages may be fixed for –

i) different scheduled employments;

ii) different classes of work in the same scheduled employment;

iii) adults, adolescents, children and apprentices;

iv) different localities.

Minimum rates of wages may be fixed by one or more of the following wage periods, namely

i) by the hour;

ii) by the day;

iii) by the month; or

iv) by such other longer period as may be prescribed;

Where such rates are fixed by the day or by the month, the manner of calculating wages for a month or for a day, as the case may be indicated, but where any wage periods have been fixed under Section 4 of the Payment of Wages Act, 1936, minimum wages shall be fixed in accordance therewith.

Minimum rates of wages: The minimum rates of wages fixed or revised by the appropriate Government in respect of scheduled employments under Section 3 may consist, according to Section 4, of:

i) a basic rate of wages and a special allowance at a rate to be adjusted, at such intervals and in such manner as the appropriate Government may direct, to accord as nearly as practicable with the variation in the cost of living index number applicable to such workers (hereinafter referred to as the "cost of living allowances"); or

ii) a basic rate of wages with or without the cost of living allowance, and the cash value of the concession in respect of supplies of essential commodities at concessional rates where so authorised; or

iii) an all inclusive rate allowing for the basic rate, the cost of living allowance and the value of the concession, if any.

The cost of living allowance and cash value of the concessions in respect of supplies of essential commodities at concession rates shall be computed by the competent authority at such intervals and in accordance with such directions as may be specified or given by the appropriate Government.

Procedure for fixing and revising minimum wages: Section 5 lays down the procedure for fixing and revising the minimum rates of wages. The appropriate Government shall adopt any of the following procedures in fixing minimum rates of wages in respect of Scheduled employment for the first time or for revising it:

a) appoint as many committees and sub-committees, as it considers necessary, to hold enquiries and advise it in respect of such fixation or revision as the case may be, or

b) by notification in the official Gazette, publish proposals for the information of persons likely to be affected thereby, and specify a date not less than two months from the date of notification, on which the proposals will be taken into consideration.

After considering the advise of the committee or committees appointed and all representations received by it, before the date specified in the official Gazette, the appropriate Government by notification in the official Gazette may fix or, as the case may be revise the minimum rates of wages in respect of each scheduled employment, which shall come into force after the expiry of three months, unless differently mentioned in the said notification.

The appropriate Government shall consult the Advisory Board if it proposes to revise the minimum rates of wages by the mode provided under clause (b) above.

Composition of Committees: Section 9 lays down that each of committee, sub-committees and the Advisory Board shall consist of persons to be nominated by the appropriate Government, representing employers and employees in the scheduled employments, who shall be equal in number and independent persons not exceeding one third of its total number, one of such independent person shall be appointed the Chairman by the appropriate Government.

Wages in kind: Section 11 of the Minimum Wages Act, 1948 provides that minimum wages payable under this Act shall be paid in cash. However, where it has been the custom to pay wages wholly or partly in kind, the appropriate Government may, by notification in the official Gazette, authorise the payment of minimum wages either wholly or partly in kind. Likewise the appropriate Government may, by notification in the official Gazette, authorise the provision of supplies of essential commodities at concessional rates.

Payment of minimum rates of wages: Section 12 provides that where in respect of any scheduled employment a notification under Section 5 is in force, the employer shall pay to every employee engaged in a scheduled employment under him wages at a rate not less than the minimum rates of wages fixed by such notification for that class of employees in that employment without any deduction except as may be authorised within such time and subject to such conditions as may be prescribed.

Fixing hours for a normal working day etc.:

1) In regard to any scheduled employment minimum rates of wages in respect of which have been fixed under this Act, the appropriate Government may:

   a) Fix the number of hours of work which shall constitute a normal working day, inclusive of one or more specified intervals;

   b) provide for a day of rest in every period of seven days which shall be allowed to all employees on any specified class of employees and for the payment of remuneration in respect of such days of rest;

   c) provide for payment for work on a day of rest at a rate not less than the overtime rate.

2) The aforesaid provisions shall apply to the following classes of employees to such extent and subject to such conditions as may be prescribed:

   a) employees engaged on urgent work, or in any emergency, which could not have been foreseen or prevent;

   b) employees engaged in work in the nature of preparatory or complementary work which must necessarily be carried on outside the limits laid down for the general working in the employment concerned;

   c) employees whose employment is essentially intermittant;

   d) employees engaged in any work which for technical reasons has to be completed before the duty is over;

   e) employees engaged in a work which could not be carried on except at times dependent on the irregular action of natural forces.

3) For the purposes of clause (c) of sub-section (2) employment of an employee is essentially intermittent when it is declared to be so by the appropriate Government on the ground that the daily hours of duty as such for the employee the hours duty, normally includes periods of in action during which the employee may be on duty but is not called upon to display either physical activity or sustained attention.

Wage for two or more classes of work: Section 16 of the Act provides where an employee does two or more classes of work to each of which a different minimum rate of wages is applicable, the employer shall pay to such employee in respect of the time respectively occupied in each. Such class work, wages at not less than the minimum rate in-force in respect of each such class.

4) **Maintenance of registers and records:** Every employer shall maintain such register and records giving such particulars of employees employed by him, the work performed by them, the wages paid to them, the receipts given by them and such other particulars and in such form as may be prescribed. Further he is required to be exhibited, in prescribed manner in the factory, workshop or place where the employees in the scheduled employment may be employed, or in the case of out-workers, in such factory, workshop or place as may be used for giving out work to them notices in prescribed form containing prescribed particulars.

5) The appropriate Government may, by rules made under this Act, provide for the issue of wage books or wage slip to employees employed in any scheduled employment in resepct of which minimum rates of wages have been fixed, and prescribed the manner in which entries shall be made and authenticated in such wage books or wage slip by the employer or his agent.

Minimum time rate wages for piece-work

Overtime: Section 14 lays down that where an employee whose minimum rate of wages is fixed under this Act by the hour, by the day, or by such longer wage period as may be prescribed, works on any way, in excess of the number of hours constituting a normal working day the employer shall pay him for every hour or part of an hours so worked in excess at the overtime rate fixed under this Act or under any law of the appropriate Government for the time being in force, whichever is higher.

Wages of a worker who works less than the normal

Section 15 provides that if an employee whose minimum rate of wages has been fixed under this Act "by the day" works on any day on which he was employed for a period less than the requisite number of hours constituting a normal working day, he shall be entitled to receive wages in respect of work done by him on that day as if he had worked for a full normal working day. But he shall not be so entitled to receive wages for a full normal working day:

i) If his failure to work is caused by his unwillingness to work, and not by the omission of the employer to provided him with work, and

ii) such other case and circumstances as may be prescribed.

Minimum time rate wages for piece-work

Section 17 provides that where an employee is employed on piece-work of which minimum time-rate and not a minimum piece rate has been fixed under this Act, the employer shall pay to such employee wages at not less than the minimum time rate.

Adjudication of Claims

Under Section 20 (1), any one of the following persons may be appointed as an authority under the Minimum Wages Act to entertain and decide claims arising out of payment of less than the minimum rates of wages in a particular area by the appropriate Government:

i) Any Commissioner for Workmen's Compensation; or

ii) Any officer of the Central Government exercising functions as Labour Commissioner for any region; or

iii) Any officer of the State Government not below the rank of Labour Commissioner; or

iv) Any officer with experience as a judge of Civil Court; or

v) Any Stipendiary Magistrate.

Procedure

An Application for claim under Section 20 (2) may be made by an employee regarding:

a) Payment of remuneration for days of rest; or

b) Remuneration for work done on such days of rest; or

c) Wages at the overtime rate under section 14.

Who may apply: Under Section 20 (2) an application may be made by (i) the employee himself or (ii) any legal practitioner, (iii) or any official of a registred trade union, (iv) person authorised in writing to act on his behalf, or (v) any Inspector, or (vi) any person acting with the permission of the authority.

Limitation: Such an application may be made within six months from the date on which the minimum wages or other payment became payable. On showing sufficinet cause for not making it within time, it may be entertained even after his period.

Procedure and hearing of the parties: On presentation of an application under Section 20 (2), for claim, it has to be admitted. After admission, notice may be issued to the employer to show cause why the application should be allowed. If the employer does not appear an ex parte order may be passed. If the employer appears the Authority will hear both parties, make any further enquiry, and if necessary, make direction to the employer under Section 20 (3).

a) In the case of a claim arising out of payment of less than the minimum rates of wages for the payment to the employee of the amount by which the minimum wages payable to him exceed the amount actually paid together with the payment of such compensation as the Authority may think fit, not exceeding ten times the amount of such excess;

b) In any other case, for the payment of the amount due to the employee, together with the payment of such compensation as the Authority may think fit not exceeding ten rupees, and the Authority may direct payment of such compensation in cases where the excess or the amount due is paid by the employer to the employee before the disposal of the application.

Finality of the direction: A direction of the Authority under Section 20 (3) shall be final. It is not appealable.

Penalty for malicious or vexatious claims: Section 20 (4) lays down that if the Authority hearing any application under this section is satisfied that it was either malicious or vexations, it may direct that a penalty not exceeding fifty rupees be paid to the employer by the person presenting the application.

Powers of Authority: Section 20 (7) provides that every Authority appointed under section 20 (1) shall have all the powers of a Civil Court under the Code of Civil Procedure, 1908, for the purpose of taking evidence and of enforcing the attendance of witnesses and compelling the production of documents, and every such Authority shall be deemed to be a Civil Court for all the purposes of Section 195 and Chapter XXXV of the Code of Criminal Procedure, 1898.

Single application in respect of a number of employees: Section 21 provides that a single application may be presented under section 20 on behalf or in respect of any number of employees, employed in the scheduled employed in respect of which minimum rates of wages have been fixed. Under Section 20 (3), the maximum compensation to be awarded shall not exceed ten times the aggregate amount of such excess or ten rupees per head as the case may be.

Recovery of the amount payable: Sub-section (5) of Section 20 provides that any amount directed to be paid under this section may be recovered:

a) if the Authority is a Magistrate, by the Authority as it were a fine imposed by the Authority as a Magistrate, or

b) if the Authority is not a Magistrate, by any Magistrate to whom the Authority makes application in this behalf as it were a fine imposed by such Magistrate.

Inspection

Section 19 (2) lays down that subject to any rules made in this behalf, an Inspector may, within the local limits for which he is appointed:

a) enter, at all reasonable hours, with such assistants, if any, being persons in the

service of the Government, or any local or other public authority, as he thinks fit, any premises or place where employees are employed or work is given out to workers in any scheduled employment in respect of which minimum rates of wages have been fixed under Act, for the purpose of examining any register, record of wages or notice required to be kept or exhibited by or under this Act or rules made thereunder, and require the production thereof for inspection;

b) examine any person whom he finds, in any premises or place and who, he has reasonable cause to believe, is an employee employed therein or an employee to whom work is given out therein;

c) require any person given out-work and any out workers, to give any information, which is in his power to give, with respect to the names and addresses of the persons to, for and from the work is given out or received, and with respect to the payments to be made for work;

d) seize or take copies of such register, record of wages or notice or portions thereof as he may consider relevant in respect of an offence under this Act which he has reason to believe has been committed by employer; and

e) exercise such other powers as may be prescribed.

Every Inspector shall be deemed to be a public servant with in the meaning of the India Penal Code. Any person required to produce any document or thing to give any information by an Inspector under Section 19 (2), as mentioned above shall be deemed to be legally bound to do so within the meaning of Section 175 and Section 176 of the Indian Penal Code.

Offences and Penalties

Section 22 provides that any employer who:

a) pays to any employee less than the minimum rates of wages fixed for the employee's class of work, or less than the amount due to him under the provisions of this Act, or

b) contravenes any rule or order made under Section 13

shall be punishable with imprisonment for a term which may extend to six months, or with fine which may extend to five hundred rupees, or with both. But in imposing any fine for an offence under this section the Court shall take into consideration the amount of any compensation already awarded against the accused in any proceedings taken under Section 20.

4.5 BONUS

4.5.1 The Perspective

The problem of bonus has assumed great significance in the present-day industrial set-up of India. Unlike personal disputes which, because of political, ideological and personnel rivalries between the unions are generally confined to a section of the establishment, bonus disputes tend to affect the entire labour force in the establishment and sometimes even the entire industry in the affected region.

4.5.2 The Concept of Bonus

The concept of bonus has undergone a marked change since the end of the World War I. Originally, it meant gratuitous payment made by the employer to his workmen at his pleasure to keep the worker contented. With the efflux of time, judicial wisdom has transformed it into a legitimate claim which the workers can demand as a matter of right.

4.5.3 The Definitions of Bonus

The term 'bonus' has not been defined in any legislative enactment. However, various Committees and Commissions and Courts have attempted to define the term. The Textile Labour Inquiry Committee defined bonus as follows:

> The term "bonus" is applied to a cash payment made in addition to wages. It generally represents the cash incentive given conditionally on certain standards of attendance and efficiency being attained.

The Bonus Commission has also defined bonus as follows:

> The concept of bonus is difficult to define in rigid terms, but it is possible to urge that once profits exceed a certain base, labour should legitimately have a share in them. In other words, we think it proper to construe the concept of bonus as sharing by the workers in the prosperity of the concern in which they are employed. This has also the advantage that in the case of low paid workers such sharing in prosperity augments their earnings and so helps to bridge the gap between the actual wage and the need-based wage.

The Payment of Bonus Act, 1965

The Object of the Act

The scheme of the Payment of Bonus Act, 1965, broadly stated, has four objectives:

i) To impose statutory obligation upon the employer of every establishment covered by the Act to pay bonus to employees in the establishment.

ii) To define principle of payment of bonus according to the prescribed formula.

iii) To provide for payment of minimum and maximum bonus and link the payment of bonus with the scheme of set-off and set-on.

iv) To provide for enforcement of the liability for payment of bonus.

The Scope of the Act

The Act covers all persons who are employed for hire or reward to do any work, skilled, manual, supervisory, managerial, administrative, technical or clerical work drawing a salary or wage not exceeding Rs. 25000 per month, in any factory or establishment employing more than 20 or more persons. The Act covers the probationer, but does not cover apprentice as he is not included within the term employee under Section 2 (13).

Applicability of the Act

The Act applies to every factory and every other establishment in which 20 or more

persons are employed on any day during accounting. However, the appropriate Government is empowered to apply the provisions of the Act to any factory/ establishment employing less than 20 but not less than 10 persons during the accounting year, after giving two months notice in the Official Gazette.

Section 2 (16) defines "establishment in public sector" as:

"establishment in public sector means an establishment owned, controlled or managed by:

a) a Government company as defined in Section 617 of the Companies Act, 1965

b) a corporation in which not less than forty per cent of its capital is held (whether singly or taken together) by:

   i) the Government or

   ii) the Reserve Bank of India, or

   iii) a corporation owned by the Government or the Reserve Bank of India

And Section 2 (15) defines "establishment in private sector" to mean an establishment other than an establishment in public sector.

The provision of this Act shall in relation to a factory or other establishment to which the Act applies, have effect of the accounting year commencing on any day in the year 1964, and subsequent accounting year. The Act once applicable to an establishment shall continue to apply notwithstanding that the number of persons employed therein falls below 20.

Calculation of Amount of Bonus

Section 10 of the Payment of Bonus Act, 1965 makes it obligatory on every employer in respect of the accounting year to pay minimum bonus which shall be 8.33 per cent of the salary or wage earned by the employee during the accounting year or one hundred rupees, whichever is higher, whether or not the employer has any allocable surplus in the accounting year. But where an employee has not completed fifteen years of age at the beginning of the accounting year, he shall be paid sixty rupees.

But where the allocable surplus of any accounting year exceeds the amount of minimum bonus payable to the employees, the employer shall in lieu of minimum bonus be bound to pay every employee in respect of that accounting year bonus which shall be an amount in proportion to the salary or wage by the employee during the accounting year subject to a maximum of 20% of such salary or wage.

Thus under the Act, in the absence of any allocable surplus in any accounting year the minimum bonus of 8.33% payable. But if the allocable surplus is available the amount of bonus shall be to a maximum of 20% of the salary or wage.

In computing the allocable surplus the amount set on or the amount set off under the provisions of Section 15 shall be taken into account.

Allocable surplus has been defined to mean:

a) in relation to an employer being a company other than a banking Company, which has not made the arrangement prescribed under the Income Tax Act for the declaration and payment with in India of the dividends payable out of its profits in accordance with the provisions of Section 194 of that Act, sixty seven per cent of the available surplus in an accounting year;

b) in any other case sixty per cent of such available surplus.

Rule of set on and set off of allocable surplus: The available allocable surplus for the relevant accounting year has to be arrived at after taking into account the figures of set on and set off in the previous year. It is as follows (Section 15):

1) Where in any accounting year, the allocable surplus exceeds the amount of maximum bonus payable under the Act to the employees in the establishment then the excess shall subject to a limit of 20% of the total salary or wages of the employees employed in the establishment in that accounting year, be carried

forward for being set on in the succeeding accounting year and soon up to and inclusive of the fourth accounting year to be utilised for the purpose of payment of bonus.

2) Where in any accounting year there is no available surplus or the allocable surplus in that year falls short of the amount of minimum bonus payable to the employees in the establishment and there is no amount or sufficient amount carried forward and set on which could be utilised for the purpose of payment of the minimum bonus, then such minimum amount or the deficiency as the case may be shall be carried forward for being set off in the succeeding accounting year up to and inclusive of the fourth accounting year.

3) This principle shall apply to all other cases not covered by the above provisions for the payment of bonus.

4) wherein any accounting year any amount has been carried forward and is set on or set off, then in calculating bonus for the succeeding accounting year, the amount carried forward from the earliest accounting year shall first be taken into account.

Special provisions: Under the Act bonus is payable to employees drawing wages exceeding Rs. 2500/- per mensem provided he has worked in the establishment for not less than thirty working days in that year (Section 8). Where however the salary or wage of an employee exceeds Rs. 1600/- per mensem, bonus for him shall be calculated as if his salary or wage is Rs. 1600/- per mensem (Section 12).

2) Where an employee has not worked for all working days in any accounting year, then the minimum bonus of one hundred rupees or sixty rupees as the case may be if that bonus is higher than 8.33 per cent of his salary or wage or wage for days he has worked shall be proportionately reduced (Section 13).

3) Where in any accounting year:

   a) an employer has paid any puja bonus or other customary bonus to an employee; or

   b) an employer has paid a part of the bonus payable to an employee under this Act, before the date on which the bonus becomes payable.

   Then the employer would deduct the amount of bonus so paid from the amount of bonus payable to the employee in respect of the accounting year and the employee would be entitled to receive the balance only (Section 17).

4) Where in any accounting year the employee is found guilty of misconduct causing financial loss to the employer then it shall be lawful for the employer to deduct the amount of loss from the amount of bonus payable by him to the employee under this Act, in respect of the accounting year and the employee shall be entitled to receive the balance, if any (Section 18).

The process of computation of the amount of bonus is as follows:

i) Gross Profit – Authorised deduction = available surplus

ii) Allocable surplus – Company (other than Banking Company) = 67% of available surplus and in others 60% of available surplus.

iii) Allocation surplus – Bonus already paid to employees = balance to be paid.

If there is allocable surplus then the maximum of it at the rate 20% of the wage or salary. If there is no allocable surplus then the minimum bonus at the rate of 8.33 per cent of wages or salary of Rs. 100 which is higher.

Disqualification for bonus: Under Section 9 of the Act a person is disqualified to receive bonus if he is dismised from service for:

a) fraud; or

b) riotous or violent behaviour while on the premises of the establishment; or

c) theft, misappropriation or sabotage of any property of the establishment.

4.6 EQUAL REMUNERATION FOR MEN AND WOMEN

Equal pay for men and women for equal work is one of the significant human rights set out in the Universal Declaration of Human Rights which the General Assembly of the United Nations adopted and proclaimed on December 10, 1948 (with not a single country voting against it) as a common standard of achievement of all people and all nations. The Declaration stipulates that "everyone without discrimination, has a right to equal pay for equal work. In 1958 the ILO concluded Convention No. 111 against discrimination in matters of employment and profession.

In September 1958, India ratified the ILO Convention No. 111 concerning equal remuneration for men and women workers for work of equal value which requires a member-State ratifying the Convention to promote as well as ensure the application or regulations legally established or recognised machinery for wage determination, collective agreements between employers and workers, or a combination of these measures. It is significant to note that notwithstanding the ratification of the Convention in 1958, India incorporated, eight years prior to its ratification, Article 39 (d) of the Constitution of India which proclaims "equal pay for equal work for both men and women" as a Directive Principle of State Policy which has to be read into the fundamental rights as a matter of interpretation. Article 14 of the Indian Constitution enjoins the State not to deny any person equality before the law or equal protection of the Laws, and Article 16 declares that there shall be equality of opportunity for all citizens in matters relating to employment or appointment to any office under the State.

The Equal Remuneration Act, 1976 seeks to provide for the payment of equal remuneration to male and female workers and prevent discrimination on the ground of sex against women in matters of employment. Section 2 (g) defines "Remunerations" to mean the basic wage or salary and any additional emoluments whatsoever payable either in cash or in kind, to a person employed in respect of employment or work done in such employment, if the terms of the contract of employment, express or implied, were fulfilled.

And Section 2 (h) defines "same work or work of similar nature" to mean:

> work in respect of which the skill, and responsibility required are the same when performed under similar working conditions, by a man or a woman and the differences, if any, between the skill effort and responsibility required of a man and those required of a woman are not of practical importance in relation to the terms and conditions of employment.

Section 3 of the Act gives overriding effects to the provisions of this Act. Section 4 incorporates the basic principle of parity of payment for equal work when it provides, itnter alia that

i) no employer shall pay to any worker, employed by him in an establishment

or employment, remuneration, whether payable in cash or in kind at rates less favourable than those at which remuneration is paid by him to the workers of the opposite sex in such establishment or employment for performing the same work or work of a similar nature.

ii) no employer shall, for the purpose of complying with the provisions of sub-section (1) reduce the rate of remuneration of any worker.

Section 5 attempts to check the discrimination in recruitment in future on the basis of sex except where the employment of women in such work is prohibited or restricted by or under any law. Section 6 provides establishment of an Advisory Committee for the purpose of providing increasing employment opportunities for authority to hear and decide complaints and claims arising from the non payment of equal pay to both men and women. The Act also provides for appointment of Appellate Authority to hear appeal against the decision of the authority. Section 16 makes an exception where difference in remuneration of men and women workers in any establishment is based on factors other than sex.

Check Your Progress 5

1) Can the employer reduce the rate of remuneration of any workers for the purpose of complying with the provisions of the Equal Remuneration Act, 1976?

.....

.....

2) Can the employer discriminate women when recruiting workers?

.....

.....

4.7 LET US SUM UP

From the above study, you may draw several conclusions. The legislation concerning minimum wages and bonus seeks to assure minimum standards of living for the workers covered therein. However its coverage is very limited. Again the payment of wages seeks to ensure payment of wages at regular interval without any unauthorised deduction. But again the scope and coverage of the Act is narrow. However the Equal Remuneration Act which seeks to ensure equal pay for equal work is wider in its scope and coverage.

4.8 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) Minimum, Living

2) Minimum Wages Act, 1948

Check Your Progress 2

1) Manager

2) No

3) Yes, provided there is a written authorisation of the employed person

Check Your Progress 3

1) At an interval not exceeding 5 years

2) No

3) Yes, provided there is a custom.

4) Yes

Check Your Progress 4

1) Yes, 8.33% of wages during the accounting year

2) Yes, 20% of the salary or wages in the accounting year.

3) Yes

Check Your Progress 5

1) No

2) No, unless prohibited under law

Srivastava, S.C. (1997), *Commentaries and Payment of Bonus Act, 1965*, Universal Book Co.: New Delhi.

UNIT 1 HUMAN RESOURCE DEVELOPMENT

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- understand the concept of Human Resource Development (HRD) Systems;
- appreciate the need for human resource development;
- relate the contributions of various HRD sub-systems to various development dimensions; and
- understand the principles in designing effective HRD systems.

1.1 WHAT IS HUMAN RESOURCE DEVELOPMENT ?

Human Resource Development relates to overall development of an individual to the fullest extent possible and utilisation of the acquired capabilities by creating the right kind of environment.

Development is acquisition of capabilities—capabilities to do the present job or the future expected job efficiently. Development of human resources is essential for any organisation that would like to be dynamic and growth-oriented. Unlike other resources, human resources have rather unlimited potential. This potential can be developed only by creating a climate that can continuously identify, bring to surface, and nurture the capabilities of people. Human Resource Development Systems aim at creating such a climate.

The competence required in an organisational set up are—Technical, Managerial, Human and Conceptual. Psychologists further differentiate knowledge, attitudes and skill components in each of these categories. Of these, knowledge components are developed with relative ease in classroom settings and with good reading habits. Attitudes and skills can be developed and strengthened mostly on the job. Attitude attains utmost importance in service sector. Mechanisms like performance appraisal, interpersonal feedback, counselling potential development, career planning and development, organisational development, autonomous work groups, job-enrichment. on the job training and continuous education aim at developing such competencies in the employees.

Gone are the days when organisations paid maximum attention towards "training" as a mechanism of developing competencies. As they started realising the limitations of training in developing skill-based competencies, and the need for creating a

"development climate" that can develop and harness the total human resources, they began exploring other mechanisms. Now-a-days those organisations which are really development-oriented have paid more attention towards creating soft bed to encourage creativity and innovation.

Many dimensions of HRD have been integrated into research, training, and organisational design and change. Others are still being explored. Trainers, researchers and consultants utilise this knowledge effectively, as they understand the different mechanisms for developing human resources and the links between them. This unit is an attempt to provide such an understanding and also to present some consideration for designing HRD systems for organisation. Human Resource Development (HRD) has gained increasing attention in the last two decades from human resource specialists, training and development professionals, chief executives and line managers.

1.2 THE CONCEPT OF AND NEED FOR HRD

Human resource development in the organisational context is a process by which the employees of an organisation are helped, in a continuous and planned way, to:

- acquire or sharpen capabilities required to perform various functions associated with their present or expected future roles,
- develop their general capabilities as individuals and discover and exploit their own inner potentials for their own and/or organisational development purposes, and
- develop an organisational culture in which supervisor-subordinate relationships, teamwork, and collaboration among sub-units are strong and contribute to the professional well being, motivation, and pride of employees.

This definition of HRD is limited to the organisational context. However, in the context of a state or nation it would differ.

HRD is a **process**, not merely a set of mechanisms and techniques. The mechanisms and techniques such as performance appraisal, counselling, training, and organisation development interventions are used to initiate, facilitate, and promote this process in a continuous way. Because the process has no limit, the mechanisms may need to be examined periodically to see whether they are promoting or hindering the process. Organisations can facilitate this process of development by planning for it, by allocating organisational resources for the purpose, and by exemplifying an HRD philosophy that values human beings and promotes their development.

HRD is needed by any organisation that wants to be dynamic and growth-oriented or to succeed in a fast-changing environment. Organisations can become dynamic and grow only through the efforts and competencies of their human resources. Personnel policies can keep the morale and motivation of employees high, but these efforts are not enough to make the organisation dynamic and take it in new directions. Employees capabilities must continuously be acquired, sharpened, and used. For this purpose, an "enabling" organisational culture is essential. When employees use their initiative, take risks, experiment, innovate, and make things happen, the organisation may be said to have an "enabling" culture.

Even an organisation that has reached its limit in terms of growth, needs to adapt to the changing environment. No organisation is immune to the need for processes that help to acquire and increase its capabilities for stability and renewal.

As the focus of HRD changes from sector to sector, so also the HRD needs differ from segment to segment but no segment can afford to ignore HRD.

Activity 1

Why do you think HRD is important for any organisation and more so for a service organisation? Prepare a short note on your own assessment as to whether continuous

HRD process is important/required for a health care organisation? Substantiate your statement with examples.

1.3 HRD MECHANISMS

In this section we make you aware with the various HRD mechanisms keeping in view the HRD goals, subsystems and beliefs.

Goals, Subsystems and Beliefs

The **goal of HRD systems** is to develop:

- the capabilities of each employee as an individual,
- the capabilities of each individual in relation to his or her present role,
- the capabilities of each employee in relation to his or her expected future role(s),
- the dyadic relationship between each employee and his or her supervisor,
- the team spirit and functioning in every organisational unit (department, group, etc.),
- collaboration among different units of the organisation, and
- the organisation's overall health and self-renewing capabilities which, in turn, increase the enabling capabilities of individuals, dyads, teams, and the entire organisation.

To achieve these objectives, HRD systems may include the following **processes, mechanisms or subsystems:**

- Performance appraisal,
- Potential appraisal and development,
- Feedback and performance coaching,
- Career Planning,
- Human resources information,
- Training,
- Organisation development (OD) or research and system development,
- Rewards,
- Employee welfare and quality of work life, and
- Continuing education for upgradation of knowledge and skills, etc.

These HRD mechanisms are capable of initiating the process of HRD in the organisation. The process may start with anyone of these mechanisms. In other words the goal is the same, but the means may be different.

All these processes/mechanisms are linked with corporate plans, particularly with human resources planning. The mechanisms are designed on the basis of the following **beliefs:**

a) Human resources are the most important assets in the organisation.

b) Unlike other resources, human resources can be developed and increased to an unlimited extent.

c) A healthy climate, characterised by the values of openness, enthusiasm, trust, mutuality, and collaboration, is essential for developing human resources.

d) HRD can be planned and monitored in ways that are beneficial both to the individual and to the organisation.

e) Employees feel committed to their work and organisation if the organisation perpetuates a feeling of "belonging".

f) Employees are likely to have this feeling if the organisation provides for their basic needs and for their higher needs through appropriate management styles and systems.

g) Employee commitment is increased with the opportunity to discover and use one's capabilities and potential in one's work.

h) It is every manager's responsibility to ensure the development and utilisation of the capabilities of subordinates, to create a healthy and motivating work climate, and to set examples for subordinates to follow.

i) The higher the level of the manager, the more attention should be paid to the HRD function in order to ensure its effectiveness.

j) The maintenance of a healthy working climate and the development of its human resources are the responsibilities of every organisation (especially the corporate management).

Activity 2

Do you feel HRD process can be initiated in health care system by introducing any of the subsystems explained above? Which of the above explained systems you feel are more important and why? Make a list of these systems as per your understanding of their priorities for health care system. Support your answer with examples.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

The HRD mechanisms or subsystems have been briefly explained below for your understanding.

Performance Appraisal

Performance Appraisal System (PAS) started with Annual Confidential Reports (ACRs), then moved to PAS and then it was restructured and called Performance Planning

Analysis and Review System, which involved maximum participation and commitment of both the parties. The latest form being 360° appraisal system.

Performance appraisal of some type are practiced in most organisations all over the world. A written assessment to which the employee responds is still common in many organisations. However, this is being replaced by performance appraisal interview between the manager and the subordinate. In such a system the subordinate's strengths and weaknesses are discussed, concerns are shared, and the subordinate is given the opportunity to defend or improve any deficits in his or her performance.

An HRD-oriented performance appraisal is used as a mechanism for supervisors to:

- understand the difficulties of their subordinates and try to remove these difficulties.
- understand the strengths and weaknesses of their subordinates and help the subordinates to realise these.
- help the subordinates to become aware of their positive contributions.
- encourage subordinates to accept more responsibilities and challenges.
- help subordinates to acquire new capabilities.
- plan for effective utilisation of the talents of subordinates.

In HRD organisations, every supervisor has the responsibility to ensure the development of his or her subordinates in relation to the capabilities required to perform their jobs effectively. Generally, the supervisor schedules individual meetings with each employee to discuss the employee's performance, communicate the performance areas that need attention, and jointly establish areas to be worked on or goals to be achieved by the next scheduled discussion.

Such performance appraisal interviews may be scheduled every three months or once or twice a year. Goals and objectives that have been agreed upon in each meeting are reviewed in the next meeting. During this review, the supervisor attempts to understand the difficulties of the subordinate and to identify his or her developmental needs.

Before each review, the employee is prepared for the discussion through self-assessment, identifying factors that have contributed to his or her performance and factors that have hindered it, as well as the types of support that he or she needs from the supervisor or others in order to do better in the next period.

The supervisor also prepares for the meeting by listing observations, problems, suggestions, and expectations. During the appraisal meeting, the supervisor and the subordinate share their observations and concerns. Each responds to the subjects raised by the other. Such discussions help to develop mutual understanding. The data generated is reported to the higher management and is used in making decisions about individual employee development as well as developmental needs of the work group or the entire organisation.

Potential Appraisal and Development

In organisations that subscribe to HRD, the potential (career-enhancement possibilities) of every employee is assessed periodically. Such assessment is used for developmental planning as well as for placement. It is assumed under this system that the company is growing continuously. It may be expanding in scale, diversifying its operations, introducing technological changes, or entering new markets. A dynamic and growing organisation needs to continually review its structure and systems, creating new roles and assigning new responsibilities. Capabilities to perform new roles and responsibilities must continually be developed among employees. The identification of employee potential to ensure the availability of people to do different jobs helps to motivate employees in addition to serving organisational needs.

Every year or two, the supervisor of a group of employees assesses the potential of each of them to perform different (usually higher level) functions on the basis of the supervisor's observations and experiences during that period. Of course, many supervisors see their subordinates doing only those jobs to which they are assigned. The ideal way to judge a person's potential would be to try the person on each job for

which his or her potential is being assessed. This is not feasible in most organisations, so simulation activities are prepared to provide some information about the potential of an employee in specific areas.

Any employee can request such assessment. It should be clear whether or not there is a position available in the company to which the employee could be transferred or promoted.

Feedback and Performance Coaching

Knowledge of one's strengths helps one to become more effective, to choose situations in which one's strengths are required, and to avoid situations in which one's weaknesses could create problems. This also increases the satisfaction of the individual. Often people do not recognise their strengths. Supervisors in an HRD system have the responsibility for ongoing observation and feedback to subordinates about their strengths and weaknesses, as well as for **guidance** in improving performance capabilities.

Career Planning

The HRD philosophy is that people perform better when they feel trusted and see meaning in what they are doing. In the HRD system, corporate growth plans are not kept secret. Long-range plans for the organisation are made known to the employees. Employees are helped to prepare for change whenever such change is planned; in fact, the employees help to facilitate the change. Major changes are discussed at all levels to increase employee understanding and commitment.

Most people want to know the possibilities for their own growth and career opportunities. Because managers and supervisors have information about the growth plans of the company, it is their responsibility to transmit information to their subordinates and to assist them in planning their careers within the organisation. Of course the plans may not become reality, but all are aware of the possibilities and are prepared for them.

Training

Training is linked with performance appraisal and career development. Employees generally are trained on the job or through special in-house training programmes. For some employees (including managers), outside training may be utilised to enhance, update, or develop specific skills. This is especially valuable if the outside training can provide expertise, equipment, or sharing of experiences that are not available within the organisation.

In-house training programmes are developed by in-house trainers or consultants hired for the task. Periodic assessments are made of the training needs within the organisation. The effects of all training programmes are monitored and added to the data concerning training needs. Managers and employees who attend in-house or outside training programmes are also expected to submit proposals concerning any changes they would like to suggest on the basis of their new knowledge. The training received by employees is thus utilised by the organisation besides enhancing the employees' skills and knowledge.

Organisational Development (OD)

This function includes research to ascertain the psychological health of the organisation. This is generally accomplished by means of periodic employee surveys. Efforts are made to improve organisational health through various means in order to maintain a psychological climate that is conducive to productivity. The OD or systems experts also help any department or unit in the company that has problems such as absenteeism, low production, interpersonal conflict, or resistance to change. These experts also revamp and develop various systems within the organisation to improve their functioning.

Rewards

Rewarding employee performance and behaviour is an important part of HRD.

Appropriate rewards not only recognise and motivate employees, but also communicate the organisation's values to the employees. In HRD systems, innovations and use of capabilities are rewarded in order to encourage the acquisition and application of positive attitude and skills. Typical rewards include certificates of appreciation, newsletter announcements, increase in salary, bonus, special privileges, and desired training. Promotions are generally not considered as rewards because promotion decisions are based on appraisals of **potential** whereas most rewards are based on **performance**. Rewards may be given to individuals as well as to teams, departments, and other units within the organisation.

Activity 3

In Healthcare sector the end product depends on the competence of the professional and the support system. Do you see any change in the trend of the reward management system? Critically evaluate the same, relating to the future prospects. Discuss in the peer group in the classroom.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

Employee Welfare and Quality of Work Life

Employees at lower levels in the organisation usually perform relatively monotonous tasks and have fewer opportunities for promotion or change. In order to maintain their work commitment and motivation, the organisation must provide some welfare benefits such as medical insurance, disability insurance, holidays and vacations, etc.

Quality-of-work-life programmes generally focus on the environment within the organisation and include: basic physical concerns such as heating and air-conditioning, lighting, and safety precautions; additional physical amenities such as food and beverage facilities, recreation, and aesthetics; and psychological and motivational factors such as flexible work hours, freedom to suggest changes or improvements, challenging work, and varying degrees of autonomy.

HRD systems focus on employee welfare and quality of work life by continually examining employee needs and meeting them to the extent feasible. Job-enrichment programmes, educational subsidies, recreational activities, health and medical benefits, and the like generate a sense of belonging that benefits the organisation in the long run.

Human Resources Information

All appropriate information about employees should be stored in a central human resources data bank (usually by means of computer). This inlcudes all basic information about each employee, training programmes attended, performance records, potential appraisals, accomplishments, etc. This data is utilised whenever there is a need to identify employees for consideration for special projects, additional training, or higher-level jobs.

The Contribution of Subsystems to HRD Goals

Each of the subsystems or mechanisms just defined contributes to the achievement of overall HRD goals.

Performance appraisal focuses primarily on helping the individual to develop his or her present role. Potential appraisal focuses primarily on identifying the employee's likely future roles within the organisation. Training is a means of developing the individual's personal effectiveness (e.g., through communication-skills laboratories) or developing the individual's ability to perform his or her present job role or future job roles. Training can also strengthen interpersonal relationships (through training in communications, conflict resolution, problem solving, transactional analysis, etc.) and increase teamwork and collaboration (through management and leadership training, team-building programmes, etc.).

Feedback and performance coaching helps the development of the individual as well as relationships. Organisation development is the mechanism for developing team collaboration and self-renewing skills. Efforts to promote employee welfare and ensure the quality of work life, along with rewards, promote a general climate of development and motivation among employees.

The HRD subsystems or mechanisms discussed so far should not be thought of in isolation. They are designed to work together in an integrated system although any of them may exist in an organisation that does not have an overall HRD plan. In isolation, these mechanisms do not afford the synergistic benefits of integrated subsystems. For example, outcomes of performance appraisal provide inputs for training needs, assessments, rewards, career planning, and feedback and performance coaching.

Activity 4

1) Discuss the HRD goals of a Hospital/Healthcare institution.

.....

1.4 DESIGNING HRD SYSTEMS

Of course, HRD systems must be designed differently for different organisations. Although the basic principles may remain the same, the specific components, their relationships, the processes involved in each, the phasing, and so on, may differ from organisation to organisation.

Designing an integrated HRD system requires a thorough understanding of the principles and models of human resource development and a diagnosis of the organisation culture, existing HRD practices in the organisation, employee perceptions of these practices, and the developmental climate within the organisation. The following principles relate to focus, structure, and functioning should be considered when designing integrated HRD systems:

1.4.1 Focus of the System

a) **Focus on enabling capabilities:** The primary purpose of HRD is to help the organisation to increase its "enabling" capabilities. These include development of human resources, development of organisational health, improvement of problem solving capabilities, development of diagnostic ability (so that problems can be located quickly and effectively), and increased employee productivity and commitment.

b) **Balancing adaptation and change in the organisational culture:** Although HRD systems are designed to suit the organisational culture, the role of HRD may be to modify that culture to increase the effectiveness of the organisation. There always has been a controversy between those who believe that HRD should be designed to suit the culture and those who believe that HRD should be able to change the culture. Both positions seem to be extreme. HRD should take the organisation forward, and this can be done only if its design anticipates change and evolution in the future.

c) **Attention to contextual factors:** What is to be included in the HRD systems, how is it to be subdivided, what designations and titles will be used, and similar issues should be settled after consideration of the various contextual factors of the organisation—its culture and tradition, size, technology, levels of existing skills, available support for the function, availability of outside help and so on.

d) **Building linkages with other functions:** Human resource development systems should be designed to strengthen other functions in the company such as long-range corporate planning, budgeting and finance, marketing, production, and other similar functions. These linkages are extremely important.

e) **Balancing specialisation and diffusion of the function:** Although HRD involves specialised functions, line people should be involved in various aspects of HRD. Action is the sole responsibility of the line people, and HRD should strengthen their roles.

1.4.2 Structure of the System

a) **Establishing the identity of HRD:** It is important that the distinct identity of HRD be recognised. The person in charge of HRD should have responsibility for this function exclusively and should not be expected to do it in addition any other function. Multiple responsibilities produce several kinds of conflict. This person should report directly to the chief executive of the organisation.

b) **Ensuring respectability for the function:** In many companies, the personnel function does not have much credibility because it is not perceived as a major function within the organisation. It is necessary that HRD be instituted at a very high level in the organisation and that the head of the HRD department be classified as a senior manager. Both the credibility and usefulness of HRD depend on this.

c) **Balancing differentiation and integration:** The human resource development function often includes personnel administration, human resource development and training, and industrial relations. These three functions have distinct identities and requirements and should be differentiated within the HRD department. One person may be responsible for OD, another for training, another for potential appraisal and assessment, etc. At the same time, these roles should be integrated through a variety of mechanisms. For example, inputs from manpower planning should be available to line managers for career planning and HRD units for potential appraisal and development. Data from recruitment should be fed into the human resources information system. If salary administration and placement are handled separately, they should be linked to performance appraisals. Differentiation as well as integration mechanisms are essential if the HRD system is to function well.

d) **Establishing linkage mechanisms:** HRD has linkages with outside systems as well as with internal subsystems. It is wise to establish specific linkages to be used to manage the system. Standing committes for various purposes (with membership from various parts and levels of the organisation), task groups, and **ad hoc** committees for specific tasks are useful mechanisms.

e) **Developing monitoring mechanisms:** The HRD function is always evolving. It, therefore, requires systematic monitoring to review the progress and level of effectiveness of the system and to plan for its next step. A thorough annual review reappraisal every three years will be invaluable in reviewing and planning the system. It may be helpful to include persons from other functions in the organisation in the HRD assessment effort.

1.4.3 Functioning of the System

a) **Building feedback and reinforcing mechanisms:** The various subsystems within HRD should provide feedback to one another. Systematic feedback loops should be designed for this purpose. For example, performance and potential appraisals provide necessary information for training and OD, and OD programmes provide information for work redesign.

b) **Balancing quantitative and qualitative decisions:** Many aspects of HRD, such as, performance and potential appraisals, are difficult to quantify. Of course attempts should be made to quantify many variables and to design computer storage of various types of information, but qualitative and insightful decisions are also necessary and desirable. For example, in considering people for promotions, quantitative data are necessary inputs, but other factors must also be taken into consideration. Thus, a balance between the mechanical and the human factors is necessary.

c) **Balancing internal and external expertise:** A human resource development system requires the development of internal expertise and resources, specifically in content areas that are used frequently within the organisation. For expertise that is required only occasionally, the use of external resources or consultants may be most feasible. It is preferable to use internal personnel to conduct training; however, an organisation that uses only in-house expertise may not benefit from new thinking in the field. On the other hand, a company that relies solely on external HRD help does not develop the internal resources that are necessary for effective functioning. Hence, a balance should be maintained.

d) **Planning for the evolution of HRD:** Various aspects of HRD can be introduced into the organisation in stages, depending on its needs, size and level of sophistication. Some aspects may require a great deal of preparation. Rushing in the introduction of an aspect of HRD may limit its effectiveness. Each stage should be planned carefully, with sequenced phases built one over the other. This may include:

   i) **Geographical phasing:** Introducing the system in a few parts of the organisation and slowly spreading it to other parts. This may be necessary in a large or widely located organisation.

   ii) **Vertical phasing:** Introducing the system at one or a few levels in the organisation and expanding up or down gradually.

   iii) **Functional phasing:** Introducing one function or subsystem, followed by other functions. For example, introducing job specifications (identification of critical attributes of jobs) before introducing a complete potential-appraisal system.

   iv) **Sophistication phasing:** Introducing simple forms of subsystems, followed after some time by more sophisticated forms.

Activity 5

Having gone through this unit, do you feel carefully designing of HRD system will make any difference in the health sector? Prepare a short note and discuss with your colleagues and friends in your organisation.

.....

.....

.....

.....

1.5 LET US SUM UP

It has now been proved beyond doubts that sustainable development cannot be achieved without paying proper attention to HRD function. Organisations have been turned around through HRD only. If the full benefits of HRD are to be experienced, it must be introduced as a total system within the organisation. The commitment of the top management to the HRD systems and its willingness to invest time and other resources is the most crucial aspect, top management must make it obvious that the human resources of the organisation are its most valuable resources. The values of openness, trust, mutuality, collaboration, and enthusiasm within the system should be recognised by every member of the organisation. If implemented properly, integrated HRD systems can contribute significantly to positive cultural changes, increased productivity, and excellence in organisation.

UNIT 2 DECISION MAKING

Structure

2.0 OBJECTIVES

After going through this unit, you should be able to:

- understand the process of decision making;
- explain the styles of decision making;
- appreciate the individual differences in decision making;
- examine the essential values which are key to decision making; and
- describe the guidelines for effective decision making.

2.1 INTRODUCTION

The making of decisions by both individuals and groups is a fundamental aspect of life in organisations. It may be defined as the process of making choices from among several alternatives. It is the most common and crucial work role of executives. The ability to make timely decisions, to exercise independent judgement and to gain positive results is the basic nature of effective decision making. Though there is no magic formula for analysing data, considering option and making a winning determination, there is a multistep process to arrive at decision.

Decision making is an activity which all of us involve into almost day in and day out. Sometimes making a decision is facilitated by the background information and circumstances but there are occasions when one is left into blank and is forced to take a decision. Such decisions may not lead to the target and may also create undesirable situations and regulations which ultimately may mar the whole process. In the field of health services there are occasions when decisions have to be taken almost instantaneously as and when one comes across the situation. Normally such situations are also accompanied by high level of anxiety and various impulses. Knowing the process of decision making in such situations does come to useful rescue for the decision maker and hence it becomes very important to understand the dynamics of decision making which may help avoiding the situations referred above. It is said that collective wisdom is always better vis-a-vis individual one. But sometimes it may prove otherwise as well. In this unit we will explain the dynamics of decision making through an example (case) from the health services which will help you to understand the various aspects of decision making.

UNIT 2 DECISION MAKING

Structure

2.0 OBJECTIVES

After going through this unit, you should be able to:

- understand the process of decision making;
- explain the styles of decision making;
- appreciate the individual differences in decision making;
- examine the essential values which are key to decision making; and
- describe the guidelines for effective decision making.

2.1 INTRODUCTION

The making of decisions by both individuals and groups is a fundamental aspect of life in organisations. It may be defined as the process of making choices from among several alternatives. It is the most common and crucial work role of executives. The ability to make timely decisions, to exercise independent judgement and to gain positive results is the basic nature of effective decision making. Though there is no magic formula for analysing data, considering option and making a winning determination, there is a multistep process to arrive at decision.

Decision making is an activity which all of us involve into almost day in and day out. Sometimes making a decision is facilitated by the background information and circumstances but there are occasions when one is left into blank and is forced to take a decision. Such decisions may not lead to the target and may also create undesirable situations and regulations which ultimately may mar the whole process. In the field of health services there are occasions when decisions have to be taken almost instantaneously as and when one comes across the situation. Normally such situations are also accompanied by high level of anxiety and various impulses. Knowing the process of decision making in such situations does come to useful rescue for the decision maker and hence it becomes very important to understand the dynamics of decision making which may help avoiding the situations referred above. It is said that collective wisdom is always better vis-a-vis individual one. But sometimes it may prove otherwise as well. In this unit we will explain the dynamics of decision making through an example (case) from the health services which will help you to understand the various aspects of decision making.

2.2 PROCESS OF DECISION MAKING

There are generally eight steps in the process of decision making but all decisions might not fully conform to the neat eight step pattern. The steps, however, may be skipped or combined. These steps are:

i) **Identifying the problems:** To decide how to solve a problem.

ii) **Defining the objectives to be met in solving the problem:** To conceive the problems in such a way that possible solutions can be identified.

iii) **Making a predecision:** It is a decision about how to make a decision. By assessing the type of problem and other aspects of situation; the managers may opt to make decision themselves.

iv) **Generating alternatives:** The stage in which possible solutions to the problem are identified/whether to rely on previously used approaches which may provide readymade answer/to go for new approaches.

v) **Evaluating alternate solutions:** Some of the alternatives may be more effective and some may be more difficult to implement. The possibilities are evaluated depending on feasibility.

vi) **Choice to be made:** Out of several evaluated alternatives and approaches that choice is made, which is most acceptable.

vii) **Implementation of the chosen alternatives** i.e. chosen alternative is carried out.

viii) **Follow up:** Monitoring the effectiveness of any attempted solution, to review whether the chosen alternative works.

You can define decision making as the process of choosing between alternatives to achieve a goal. But if you closely look into this process of selecting among available alternatives, you will be able to identify three relatively distinct stages. Put into a time framework, you will find:

1) **The past**, in which problems developed, information accumulated, and the need for a decision was perceived;

2) **The present,** in which alternatives are found and the choice is made; and

3) **The future,** in which decisions will be carried out and evaluated.

Herbert Simon, the well-known Nobel laureate decision theorist, described the activities associated with three major stages in the following way:

1) **Intelligence Activity:** Borrowing from the military meaning of intelligence Simon describes this initial phase as an attempt to recognise and understand the nature of the problem, as well as search for the possible causes;

2) **Design Activity:** During the second phase, alternative courses of action are developed and analysed in the light of known constraints; and

3) **Choice Activity:** The actual choice among available and assessed alternatives is made at this stage.

If you have followed the nature of activities of these three phases, you should be able to see why the quality of any decision is largely influenced by the thoroughness of the intelligence and design phases.

Henry Mintzberg and some of his colleagues (1976) have traced the phases of some decisions actually taken in organisations. They have also come up with a three-phase model as shown in Fig. 2.1.

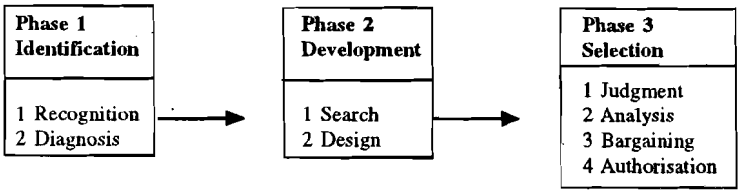

Figure 2.1: Mintzberg's empirically based phases of decision making in organisations

Source: Mintzberg, Raisinghani and Theoret, 1976.

1) **The identification phase,** during which **recognition** of a problem or opportunity arises and a **diagnosis** is made.

2) **The development phase,** during which there may be a **search** for existing standard procedures, ready-made solutions or the **design** of a new, tailor-made solution. It was found that the design process was a grouping, trial and error process in which the decision-makers had only a vague idea of the ideal solution.

3) **The selection phase,** during which the choice of a solution is made. There are three ways of making this selection: by the **judgement** of the decision maker, on the basis of experience or intuition rather than logical analysis; by **analysis** of the alternatives on a logical, systematic basis; and by **bargaining** when the selection involves a group of decision makers. Once the decision is formally accepted, an **authorisation** is made.

Note that the decision making is a dynamic process and there are many feedback loops in each of the phases. These feedback loops can be caused by problems of timing, politics, disagreement among decision-makers, inability to identify an appropriate alternative or to implement the solution or the sudden appearance of a new alternative etc. So, though on the surface, any decision-making appears to be a fairly simple three-stage process, it could actually be a highly complex dynamic process.

Activity 1

Evaluate the steps taken by you in most frequently made decisions. Whether you find all these steps are followed. Prepare a short note on making decision for treatment of a patient brought to you.

2.3 TYPES OF MANAGERIAL DECISIONS

There are many types of decisions which you would be required to make as a manager. Three most widely recognised classifications are:

The first classification of **Personal** and **Organisational** decisions was suggested by Chester Barnard, nearly fifty years ago in his classic book: "The Functions of the Executive". In his opinion, the basic difference between the two decisions is that "personal decisions cannot ordinarily be delegated toothers, whereas organisational decisions can often, if not always, be delegated" **(Barnard, 1937).** Thus, the manager makes organisational decisions that attempt to achieve organisational goals and personal decisions that attempt to achieve personal goals. Note that personal decisions can affect the organisation, as in the case of a senior manager deciding to resign. However, if you analyse a decision, you may find that the distinctions between personal and organisational decisions are a matter of degree. Your are, to some extent, personally involved in any organisational decision that you make and you need to resolve the conflicts that might arise between organisational and personal goals.

Another common way of classifying types of decisions is according to whether they are **basic** or **routine**. Basic decisions are those which are unique, one-time decisions involving long-range commitments of relative permanence or duration, or those involving large investments. Examples of basic decisions in a business firm include

plant location, organisation structure, wage negotiations, product line, etc. In other words, most top management policy decisions can be considered as basic decisions.

Routine decisions are at the opposite extreme from basic decisions. They are the everyday, highly repetitive, management decisions which by themselves have little impact on the overall organisation. However, taken together, routine decisions play a tremendously important role in the success of an organisation. Examples of routine decisions are an accountant's decision on a new entry, a production supervisor's decision to appoint a new worker, and a salesperson's decision on what territory to cover. Obviously, a very large proportion (most experts estimate about 90 per cent) of the decisions made in an organisation are of the routine variety. However, the exact proportion of basic to routine types depends on the level of the organisation at which the decisions are made. For example, a first-line supervisor makes practically all the routine decisions whereas the chairperson of the board makes very few routine decisions but many basic decisions.

Simon (1977) distinguishes between **Programmed** (routine, repetitive) decisions and **Non-programmed** (unique, one-shot) decisions. While programmed decisions are typically handled through structured or bureaucratic techniques (standard operating procedures), non-programmed decisions must be made by managers using available information and their own judgement. As is often the case with managers, however, decisions are made under the pressure of time.

An important principle of organisation design that relates to managerial decision making is Gresham's law of Planning. This law states that there is a general tendency for programmed activities to overshadow non-programmed activities. Hence, if you have a series of decisions to make, those that are more routine and repetitive will tend to be made before the ones that are unique and required considerable thought. This happens presumably because you attempt to clear your desk so that you can get down to the really serious decisions. Unfortunately, the desks very often never get cleared.

After going through the three types of classification of managerial decisions, you could see that there is no single and satisfactory way of classifying decision situations. Moreover, the foregoing classifications have ignored two important problem-related dimensions: (1) How **complex** is the **problem** in terms of number of factors associated with it; and (2) how much **certainty** can be placed with the **outcome** of a decision. Based on these two dimensions, four kinds of decision modes can be identified: Mechanistic, Analytical, Judgemental, and Adaptive (See Fig. 2.2).

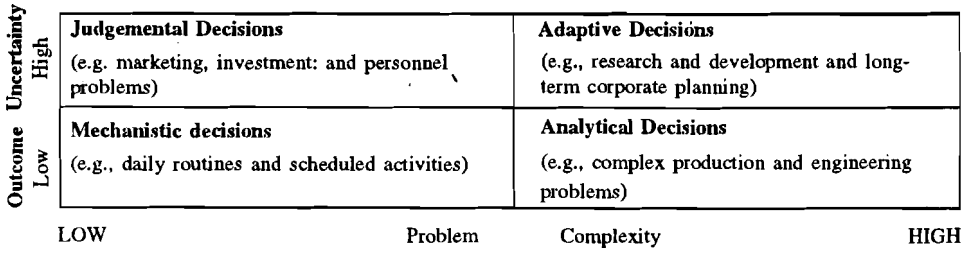

Fig. 2.2 : Types of Managerial Decisions

1) **Mechanistic Decisions:** A mechanistic decision is one that is routine and repetitive in nature. It usually occurs in a situation involving a limited number of decision variables where the outcomes of each alternative are known. For example, the manager of a bicycle shop may know from experience when and how many bicycles are to be ordered; or the decision may have been reached already, so the delivery is made routinely. Most mechanistic decision problems are solved by habitual responses, standard operating procedures, or clerical routines. In order to further simplify these mechanistic decisions, managers often develop charts, lists, matrices, decision trees, etc.

2) **Analytical Decisions:** An analytical decision involves a problem with a large number of decision variables, where the outcomes of each decision alternative can be computed. Many complex production and engineering problems are like this.

They may be complex, but solutions can be found. Management science and operations research provide a variety of computational techniques that can be used to find optimal solutions. These techniques include linear programming, network analysis, inventory reorder model, queuing theory, statistical analysis, and so forth.

3) **Judgemental Decisions:** A judgemental decision involves a problem with a limited number of decision variables, but the outcomes of decision alternatives are unknown. Many marketing, investment, and resource allocation problems come under this category. For example, the marketing manager may have several alternative ways of promoting a product, but he or she may not be sure of their outcomes. Good judgement is needed to increase the possibility of desired outcomes and minimise the possibility of undesired outcomes.

4) **Adaptive Decisions:** An adaptive decision involves a problem with a large number of decision variables, where outcomes are not predictable. because of the complexity and uncertainty of such problems, decision makers are not able to agree on their nature or on decision strategies. Such ill-structured problems usually require the contributions of many people with diverse technical backgrounds. In such a case, decision and implementation strategies have to be frequently modified to accommodate new developments in technology and the environment.

Activity 2

Refer to Fig. 2.2 and subsequent discussions on four types of managerial decisions. Answer the following questions.

1) Which types of managerial decisions correspond to "Programmed" decision?

.....

.....

.....

.....

2) Which types of managerial decisions correspond to "Non-programmed" decision?

.....

.....

.....

3) Which types of managerial decisions correspond to "Basic" decision?

.....

2.4 DECISION MAKING UNDER DIFFERENT STATES OF NATURE

In the previous topic on types of decisions you have seen that a decision-maker may not have complete knowledge about decision alternatives (i.e., High Problem Complexity) or about the outcome of a chosen alternative (i.e. High Outcome Uncertainty). These conditions of knowledge are often referred to as states of nature and have been labelled:

1) Decisions under Certainty

2) Decisions under Risk

3) Decisions under Uncertainty

Fig. 2.3 depicts these three conditions on a continuum showing the relationship between knowledge and predictability of decision states.

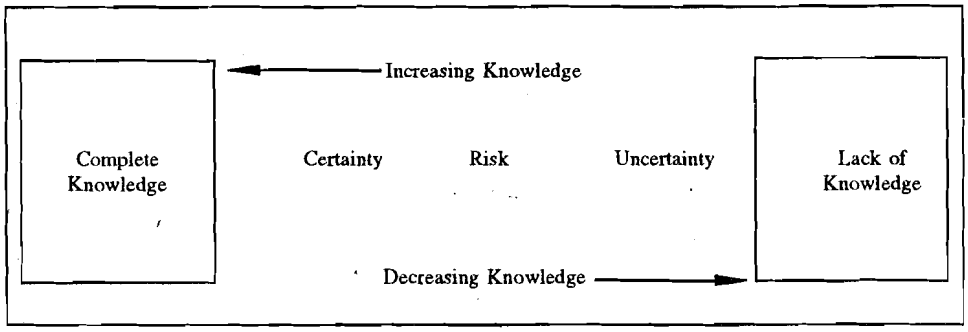

Fig. 2.3: Decision Making Conditions Continuum

Decisions making under certainty: A decision is made under conditions of certainty when a manager knows the precise outcome associated with each possible alternative or course of action. In such situations, there is perfect knowledge about alternatives and their consequences. Exact results are known in advance with complete (100 per cent) certainty. The probability of specific **outcomes** is assumed to be equal to one. A manager is simply faced with identifying the consequences of available alternatives and selecting the outcome with the highest benefit or payoff.

As you can probably imagine, managers rarely operate under conditions of certainty. The future is only barely known. Indeed, it is difficult to think of examples of all but the most trivial business decisions that are made under such conditions. One frequent illustration that is often cited as a decision under at least near certainty is the purchase of government bonds or certificates of deposit. For example, as per the assurance provided by Government of India, Rs. 1,000 invested in a 6-year National Savings Certificate will bring a fixed sum of Rs. 2,015 after six complete years of investment. It should still be realised, however, that the Government defaulting on its obligations is an unlikely probability, but the possibility still exists. This reinforces the point that very few decisions outcome can be considered 'a sure thing'.

Decision making under risk: A decision is made under conditions of risk when a single action may result in more than one potential outcome, but the relative probability of each outcome is known. Decisions under conditions of risk are perhaps the most common. In such situations, alternatives are recognised, but their resulting consequences are probabilistic and doubtful. As an illustration, if you bet on number 6 for a single roll of a dice, and have a 1/6 probability of winning in that there is only one chance in six of rolling a 6. While the alternatives are clear, the consequence is probabilistic and doubtful. Thus, a condition of risk may be said to exist. In practice, managers assess the likelihood of various outcomes occurring based on past experience, research, and other information. A quality control inspector, for example, might determine the probability of number of 'rejects' per production run. Likewise, a safety engineer might determine the probability of number of accidents occurring, or a personnel manager might determine the probability of a certain turnover to absenteeism rate.

Decision making under uncertainty: A decision is made under conditions of uncertainty when a single action may result in more than one potential outcome, but the relative probability of each outcome is unknown. Decisions under conditions of uncertainty are unquestionably the most difficult. In such situations a manager has no knowledge whatsoever on which to estimate the likely occurrence of various alternatives. Decisions under uncertainty generally occur in cases where no historical data are available from which to infer probabilities or in instances which are so novel and complex that it is impossible to make comparative judgements.

Examples of decisions under complete uncertainty are as difficult to cite as example of decisions under absolute certainty. Given even limited experience and the ability to generalise from past situations, most managers should be able to make at least some estimate of the probability of occurrence of various outcome. Nevertheless, there are undoubtedly times when managers feel they are dealing with complete uncertainty.

Selection of a new advertising programme from among several alternatives might be one such example. The number of factors to be considered and the large number of uncontrollable variables vital to the success of such a venture can be mind-boggling.

On a personal level, the selection of a job from among alternatives is a career decision that incorporates a great deal of uncertainty. The number of factors to be weighed and evaluated, often without comparable standards, can be overwhelming.

Activity 3

Identify six decisions that you have taken during last one year. Check which decisions were made under certainty, under risk and under uncertainty.

Decisions	Certainty	Risk	Uncertainty
1).....	( )	( )	( )
2).....	( )	( )	( )
3).....	( )	( )	( )
4).....	( )	( )	( )
5).....	( )	( )	( )
6).....	( )	( )	( )

2.5 DECISION MAKING STYLES

Vroom and Yetton have divided decision making process into five styles ranging from totally individualised decision by the manager on one extreme to totally participative decision making styles on the other hand.

AI (Autocratic I): The manager unilaterally makes the decision and his decision is based upon whatever information and facts are available to him.

AII (Autocratic II): The manager makes the decision himself but gets all the information needed personally from his subordinates. The role of the subordinates is input of data only. They do not take any part in the decision making process. They may not even know what the problem is. Even if they know about the problem, they have no input in generating or evaluating alternative solutions.

CI (Consultative I): While in all styles, manager simply gets the information from his subordinates, in CI style, he consults his subordinates who are expected to be involved with the outcome of the decision or who are knowledgeable about certain elements of the problems, individually getting their ideas and suggestions without bringing them together as a group. The decision-making is still up to him. He may or may not take their suggestions into consideration when making the final decision.

CII (Consultative II): In this style of decision making, instead of meeting with the subordinates individually, he meets with them together in a group gathering from them their ideas and suggestions related to the problem. His final decision still may or may not reflect their input.

GII (Group II): This is a participative style of decision making. The problem is shared with the group and solution alternatives are generated and evaluated together. The final solution is decided by the group and such solution is implemented.

There are a number of situational factors that would determine the style to be adopted. Some of these factors are:

i) The extent to which the manager possesses the information and expertise to make a high quality decision.

ii) The extent to which the subordinates have the necessary information to assist in generating a high quality decision.

iii) The extent to which problem is structured.

iv) The probability that a manager's decision will be accepted by the subordinates.

v) The extent to which the subordinates would go to attain organisational goals.

vi) The extent to which acceptance on the part of subordinates is critical to the effective implementation of the decision.

vii) The extent to which the subordinates are likely to disagree over preferred solutions.

2.6 INDIVIDUAL DECISION STYLE: INDIVIDUAL DIFFERENCES IN DECISION MAKING

Some people are primarily concerned with achieving success at any cost, others are more concerned about the effects of their decisions on others. Furthermore, some individuals tend to be more logical and analytic whereas others are more intuitive and creative. The important differences exist in the approaches, decision makers take to problems. There are four major decision styles:

i) **The directive style:** It is characterised by people who prefer simple, clear solutions to problems. Individuals with this style tend to make decisions rapidly because they use little information and do not consider many alternatives. They tend to rely on existing rules to make their decisions and aggressively use their status to achieve results.

ii) **Analytical style:** Individuals with the analytical style tend to be more willing to consider complex solutions based on ambiguous information. People with this style tend to analyse their decision carefully using as much data as possible. Such individuals tend to enjoy solving problems. They want the best possible answers and are willing to use innovative methods to achieve them.

iii) **Conceptual style:** Compared to the directive and analytical styles, people with the conceptual style tend to be more socially oriented in their approach to problems. Their approach is humanistic and artistic. Such individuals tend to consider many broad alternatives when dealing with problems and to solve them creatively. They have a strong future orientation and enjoy initiating new ideas.

iv) **Behavioural style:** Individuals with the behavioural style may be characterised as having a deep concern for the organisations in which they work and the personal development of their coworkers. They are highly supportive of others and very concerned about others' achievements, frequently helping them meet their goals. Such individuals tend to be open to suggestions from others and, therefore, tend to rely on meetings for making decisions.

2.7 WHAT MAKES INDIVIDUAL DECISIONS IMPERFECT?

Framing: Refers to tendency for people to make different decisions based on how problem is presented either in a negative term (leading to risk seeking) or positive term (leading to risk-aversion).

Heuristics: Simple decision rules (rules of thumb) used to make quick decisions about complex problems. The judgements are based on information that is readily available which may or may not be accurate, or by perceiving others in stereotypical way if typical representative appear to be of category to which they belong.

Bias towards favourites: People prefer the implicit favourite option (i.e. preferred alternatives) selected even before all the options have been considered.

Escalation of commitment phenomenon: The tendency for people to continue to support previously unsuccessful course of action.

2.8 WHAT MAKES GROUP DECISION MAKING IMPERFECT ?

Face to face **brainstorming** groups tend to inferior decisions on creative problems. However, when it is done electronically through computer terminals to send messages, the quality of decisions tend to improve.

Group think is a major obstacle to effective group decisions. It refers to tendency for strong conformity pressures within the groups to lead to the breakdown of critical

thinking and to encourage premature acceptance of questionable solutions. Group think can however be improved by promoting open enquiries, using sub-groups, admitting shortcomings, and holding second chance meeting.

2.9 ESSENTIAL VALUES : KEY TO DECISION MAKING

i) **Accountability:** The decision makers should be accountable not only for the decisions made but for how the decisions were arrived at i.e. what data was analysed and which course of action was pursued.

ii) **Adaptability:** This means flexible in considering options, being able to deal with a wide range of people, and having a versatile approach. Care should be taken, however, to avoid being too adaptable i.e. becoming wishy washy or irresolute by spending too much time considering options. The balance should be kept between rigid thinking and ineffective leadership.

iii) **Dependability:** A leader should see that timely decision-making is done without staffinput or shows constant reluctance to take stand.

iv) **Visibility:** Visible leaders are 'present' and in conducting studies they are around to hear cheers and the boos. The leaders visibility does not diminish in critical times.

2.10 GUIDELINES FOR EFFECTIVE DECISION MAKING

Some of the more useful guidelines to make the group decision making more effective are given below:

1) Be sure that the purpose of the group is well defined and clearly understood by all members of the group.

2) Be sure that the group members communicate freely with each other and that everyone understands each others' roles and aspirations.

3) Be sure that the group is representative of those individuals who will either implement the decision or be affected by it.

4) Be sure that the group has access to all the necessary resources of information and other supportive elements so as to reach an efficient and fast conclusion.

5) Be sure that the composition of the group is appropriate so that the members have the necessary skills and expertise in discussing and evaluating the problems at hand.

6) Be sure that each member is committed to the decision made, after all viewpoints have been thoroughly and rationally considered. Even if some members had different viewpoints prior to reaching the decision, the conflict should not be carried over after the decision has been made.

7) Be sure that the group is not dominated by any member including the leader so that all group members are encouraged to give input freely.

8) Be sure that the size of the group is adequate. Too many members would result in excessive waste of time and unnecessary diversification and too few members may not be enough to look at all angles of the problems. Usually, and for most groups, five members are considered to be adequate.

2.11 LET US SUM UP

In this unit, we have tried to assesss the dynamics of decision making. Decision making is a complex process which involves all the skills learnt by you, having gone through the inputs

given in this couse. In this unit we have basically talked about the process of decision making, the decision and its fall outs. All these stages have bearing on each other and are the part of a circle. Towards the end of the unit we have also tried to generate the check-list for effective decision making. We have tried to critically evaluate the pros and cons of the individual and the group decision making. We have concluded this unit with the essential values to be observed while taking a decision and also have developed the guidelines for effective decision making. The activities provided in this unit are particularly very important as they will require application of the knowledge and skills earned out of the unit's content. The activities have been basically drawn out of the day to day experiences in the organisational set up. Hence you should be very particular in attending the activities. There is also another purpose in keeping this unit as the last one, as now on when you take up the cases, at each and every step you would be confronted either by yourself in taking a particular decision or by the decision made by any character in the cases. Sometimes you will also be faced with dilemma of taking one or the other decision. At this juncture you will be rescued by the skills and knowledge gained through this unit.

Introduction

You have gone through the unit on Human Resource Development. This unit has provided you with an insight into what is HRD, how it works, what are the mechanisms, instruments and processes. The most important thing in HRD is creating a climate of trust and development, wherein the worker feels secured and motivated to take risk with confidence. Security and motivation tremendously add to the success rate.

In this part of the block, we are giving few cases related to the units in the block. First few cases are related to various concepts/problems of HRD, followed by a few cases in the area of decision making. Sometimes you may feel that the cases given do not directly relate to the units or the topics discussed under the units but it is not so. You will realise going deep into the case/root cause of the problem, that one or the other fundamental aspects of these broad topics do apply in these cases. These concepts/application/practices may sometime form the central problem of the case and sometimes they may be part of the solution to be proposed by some of you. While analyzing these cases you may also refer to the other units/ blocks/concepts/explanations/application/practices etc. and take help thereof in either explaining the problem, developing the alternatives or proposing the remedies. A good case analysis should have the critical view of problem from various angles supported by logical reasoning. As you know in the field of medicine the two cases with the identical problem may be prescribed different treatment, looking at various factors e.g. the health of the patient, the history of the disease, the history of the family of the patient, the habit and immunity level of the patients and so on and so forth. In the same way in management also two similar problems may be solved differently by two different persons. It is, therefore, not likely that any problem should have a standard solution. Anybody may propose any type of solution to the problem. What is important is that how do you reason out or support your solution. It depends on the approach and perception of the problem solver.

It is advised that these cases may be discussed in peer groups for better understanding and analysis. Do write down the analysis of these cases and critically evaluate them in a classroom kind of situations. The objective is to make you aware of the case discussions method of finding solution. You may also take live cases from your day to day working environment and also discuss them in the light of the knowledge you have gained by going through this course.

The basic objective of this part of the block is to make you work and apply the knowledge gained in this course till now in analyzing the cases. Most of the cases being given here have been taken from the medical environment, which relate to your day to day working and the problems faced in administration of health-care institutions. Since most of you are experienced in this area, you have your own perceptions and beliefs which is most likely to affect your analysis of the situation given in the cases. You may certainly draw upon the same to reach the solutions. The solutions proposed by others may be quite different from the one you are prescribing, however, all of them may be taken as practical solutions if supported by sound logic.

CASE 1 : Savitri Trains Dais*

Padampur Block, the tehsil headquarters of Gonda District in Uttar Pradesh, has a population of 1,20,000. The main town has a population of 27,000, and the rest of the population is distributed unevenly in 110 villages. The PHC is located at the block headquarters and has 15 sub-centres. The PHC has three medical officers, three health assistants (F), 15 health workers (F) and other staff.

Mohini is a health assistant (F) posted at the PHC headquarters. She is married and has come from a cadre of lady health visitors. She is considered by her colleagues to be an effective training administrator, and for this reason she is incharge of the dai training programme. She has a good image in the community and the dai training programme has shown remarkable success under her leadership.

The training of dais is conducted by Savitri, a health worker (F), who acts as the chief trainer. She is middle-passed and has three years' experience on the job, but no formal training.

Asha, an illiterate and traditional midwife, is in the final week of dai training. She is married and aged about 50 years.

Asha and Savitri have gone to a village woman Rekha to attend to a normal pre-natal case. This is part of Asha's supervised field training. Mohini, the health assistant (F), happens to be present in the village on a routine supervisory visit, and so she also enters the house of Rekha. At this moment, the case writer arrived, and proceeded to conduct the following interview:

Case Writer: "Smt. Mohini, medical officer PHC tells me you are a good training administrator, and you are organising the training of dais in this block. I presume you have received some guidelines and support for the training from the MO/PHC?"

Mohini: "Sir, I.....(long silence)."

Case Writer: "Do you receive any guidance and support from the medical officers of the PHC?"

Mohini: "Well, Sir, I get some overall guidance from MO/PHC. A meeting on dai training was once held under the chairmanship of MO/PHC. I pointed out the difficulty of conducting the sessions on the varandah and requested a foetal doll and other audio-visual aids. After all, the quality of training depends on all these factors. But nothing tangible.....(another long silence)."

Case Writer: "Smt. Mohini, do you yourself conduct the training of dais?"

Mohini: "No. The training is actually conducted by the health worker (F), Smt. Savitri. She is a good worker. Of course, I plan out the whole programme, and Savitri merely teaches."

Case Writer: (Looking at Smt. Savitri) "Well, Smt. Savitri, as you conduct the training, may I please ask you a few questions? Can you tell me something about the venue and duration of the training and the staff responsible?"

Smt. Savitri: (Looking at Smt. Mohini for a moment) "Sir, the training is conducted at Padampur, the PHC headquarters, and is for four weeks: four days a week in the classroom and two days in the field. Sunday is observed as a holiday. Clinic demonstration is held at the sub-centre, and home visits and supervised delivery are conducted in the field. Smt. Mohini, my supervisor, provides me guidance whenever I am in difficulty.

Case Writer: "But Smt. Savitri, do you have other responsibilities? For example, do you not conduct once a week clinics at your sub-centre?"

Smt. Savitri: (Looking at Smt. Mohini) "Yes, Sir, I always utilise the day for demonstration."

Case Writer: "Have you received any training in how to teach dais/or any kind of training of trainers courses?"

Smt. Savitri: "No. I am not trained. I have learnt by doing. Madam (looking at Smt. Mohini)

---

* Roy, Somnath *et al.*, *Case Studies in Health Management*, National Institute of Health and Family Welfare, New Delhi, 1987.

also helps me. Copies of the training guide and handbook of dais are available at the PHC. They are quite useful. I would like to have some training so that I can conduct the training of dais in a more effective manner."

Case Writer: "Where do you hold classes? Do you have some teaching aids and demonstration materials?"

Smt. Savitri: "There is no separate classroom at the PHC. I hold sessions on the verandah, which is partly enclosed by a moveable curtain. But the verandah is also a walkway for patients attending the out-patients clinic. I have a black-board, a few charts, and a dai kit. I am yet to be provided further aids like a foetal doll. As these conditions are not very good for training, I prefer sometimes to organise training at my sub-centre."

Case Writer: "How do you teach the subject areas such as managing normal labour, care of breasts, cutting the cord, etc.? Have you prepared any lesson plans? Tell me some of the methods you use during the training."

Smt. Savitri: (Looking at Smt. Mohini) 'Well, Sir, I discuss the subject area in the classroom and then give actual demonstration at my sub-centre or during home visits. I do not have any lesson plan, but that is a good suggestion. I would like to make lesson plans. Also, I have a mind to use a role-play in future, but as yet I have not felt confident to use a role-play."

Case Writer: "What supplies and equipments do you have? Can you use them for demonstration during the training?"

Smt. Savitri: "Well, Sir, I have been supplied with a dai kit. There is a boiling pan and a stove in working condition, but kerosene is often not available. I have test tubes and spirit lamp, but the re-agents are in short supply. I have a clinical thermometer, but no blood pressure recording apparatus. Of course, an enema bag is there. I have requested MO/PHC through my supervisor for a weighing scale. Whatever is available, Sir, I utilise them for classroom instruction and demonstration."

Case Writer: "What are some of the family planning devices you use for demonstration?"

Smt. Savitri: "Nirodh, oral pills and IUD, I always use, Sir, but I am sorry to say that the foam tablets and the contraceptive jelly are not available."

Case Writer: "Have you received any training in family planning?"

Smt. Savitri: "No, Sir."

Case Writer: (Turning to Asha, the dai undergoing training) "Well, Smt. Asha, tell me, are you confident of handling a normal delivery?"

Smt. Asha: "Well, Sir, I am yet to conduct a normal delivery under the guidance of my supervisor. I also want to know how to follow up a case after delivery."

Case Writer: (With astonishment in his voice) "Have you not covered these things so far? Only three or four days are left for the completion of your training."

Smt. Asha: "Well, Sir, I could not attend the field training for two days as my child was sick."

Case Writer: "Can you tell me, Smt. Asha, what hygienic practices will you use while conducting a delivery?"

Smt. Asha: "I will wash my hands with clean water, boil the equipment and use the mackintosh rubber sheet to conduct the delivery."

Case Writer: "What about washing your hands with soap and water?"

Smt. Asha: "I think that there is no need for soap, so long as I wash my hands with clean water."

Case Writer: "Were you involved during your training in motivating mothers to accept family planning?"

Smt. Asha: Yes, Sir, during the field visit, once I saw Savitri advising mothers to accept a family planning method. But I did not advise them personally. Perhaps that will come later in my training."

Case Writer: (Looking at Smt. Savitri) "Smt. Saviri, what techniques do you adopt to reinforce learning?"

Smt. Savitri: "I usually ask questions during and after the training session. If I have time, I ask for demonstration."

Case Writer: "Do you conduct evaluation?"

Smt. Savitri: "No evaluation is conducted, but I follow-up in the field after training."

Case Writer: (Looking at Asha) "Have you received any stipend?"

Smt. Asha: "No, Sir. I enquired from Savitri, but she told me that it would be available only after the completion of my training. I am worried about the stipend and cannot fully concentrate on my training."

Case Writer: (Looking at Rekha, the mother in whose house all are assembled) "Well, Rekha, are you satisfied with the service rendered by Smt. Asha?"

Smt. Rekha: "Well, Sir, Smt. Asha is a dai of my village. I know she is at present undergoing training at the PHC. I hope she will render better service in future. The other day I had some pain in my abdomen. I called for Smt. Asha, but she was away at the PHC. My neighbour gave me a 'puria' to swallow with water. This relieved my pain immediately."

Questions for Discussion

1) How did Smt. Mohini visualise her role as training administrator for the dai training programme?
2) A principle of management is to delegate responsibility to subordinates whenever possible. Comment on Smt. Mohini's delegation of training responsibilities to Savitri.
3) How do you react to the role played by the MO/PHC?
4) What actions would you take to improve this dai training?
5) How would you convert such opportunities into HRD opportunity to invert the weaknesses into strengths?
6) What kind of HRD intervention would you recommend and introduce for the purpose?

CASE 2 : Dr. Mahajan's Transfer*

It was January 1985. The country was in the midst of an election. The political parties have pressed into service audio-visual media. The place is a big town situated right in the heart of the country. Its location has made it a railway junction of national importance. The election added to its role as a distribution point for political parties. Colourful flags, varied symbols, and big and small processions filled the streets of the town. A section of one procession suddenly turned violent and before the local leaders could pacify their respective groups, one man was stabbed. A group of supporters carried the wounded man to a nearby government dispensary.

The dispensary is poorly equipped, and the general mismanagement of the dispensary is suddenly and unexpectedly thrown open to critical political eyes. The crowd immediately turns the situation into a very rewarding issue against the ruling party. Slogans are raised, denouncing the government and the absence of the doctor, Dr. Mahajan (The doctor had left the dispensary after a full day's work).

The opposition leaders decided not to waste this rare opportunity to embarass the government, and they quickly formed a procession and marched toward the main market street of the town. Only four days remained before the balloting was to begin. Partly real, but mostly imaginary, deficiencies of the government dispensary now became a vital issue in the election battle. The dispensary was suddenly in the centre of the election campaign.

Meanwhile at the dispensary, Dr. Mahajan treated the wounded political party worker. He remained with the patient for the whole night, but early in the morning he left for home. The local political boss, before starting the election round for the day, visited the dispensary. He found the condition of the party worker very critical. Dr. Mahajan was summoned, but before he could reach the dispensary, the patient died. The death further infuriated the political party workers. The news spread like wild fire throughout the district. The local press, as is expected during election time, gave full exposure to the charge and carried details of views that the political party worker in the government dispensary had been neglected and allowed to die unattended.

The press reports and rumours greatly unnerved the otherwise composed Chief Medical Officer (CMO) of the district. Being an experienced and seasoned administrator, he at once realised the possible serious implications of the whole situation. In normal times he would have allowed such a situation to cool off. But during the election time this approach could prove quite costly. He got completely carried away by the newspaper account of the incident. He did not wait for any official report or message from Dr. Mahajan. His immediate response was to rush to the scene. As soon as he entered the town he was completely overpowered by the agitated crowds. Rather than going to the dispensary and finding out at first hand what had happened, he instead went to the party office. The party boss could not be satisfied with anything less than suspension and dismissal of the doctor. The CMO immediately called for Dr. Mahajan and on the spot ordered his transfer to the District Office.

This transfer was affected in spite of the fact that Dr. Mahajan was dutiful on the day of the incident, attended the patient personally throughout the night, and hastened to the dispensary in the morning when told of the critical condition of the patient. Even otherwise, he seemed to be quite acceptable to the local population as evidenced by the fact that he has been serving for the last five years in this town, and there had been no complaint against him.

Dr. Mahajan was shocked on getting the transfer order. A stream of questions rushed one after another through his mind. Is this the reward of good service? Is it not my humiliation before the public? Why is the CMO playing sweet to the political boss at the cost of a good doctor? Is it not necessary for the CMO to know the facts at first hand in the dispensary? Why did the CMO not give me a chance to explain the situation? Finding no satisfactory answers, Dr. Mahajan felt very much demoralised and confused. However, he said nothing and accepted the transfer to the District Office.

The transfer pacified the local political boss, and gave a sense of pride and achievement to the political party which used the instantaneous transfer as evidence of its strength and power. In the four days remaining until the voting, the CMO feared similar violence and,

* Roy, Somnath *et al.*, *Case Studies in Health Management*, National Institute of Health and Family Welfare, New Delhi: 1987.

therefore, could not leave the dispensary without a doctor in-charge in case another political party worker was injured and needed treatment. There were two other doctors in the dispensary in addition to the one (Dr. Mahajan) already transferred. The CMO had to put one doctor as in-charge of the dispensary before returning to district headquarters. Instead of appointing one of the two local doctors, he decided to bring in an outside doctor from the District Headquarters. He thought of three possible candidates, but as he had no strong personal knowledge of any of the three doctors, he could not choose one from amongst them. He shared his predicament with a Multipurpose Worker (MPW), who suggested the name of Dr. Puri. The CMO immediately wrote a transfer order of Dr. Puri, and then sent the MPW in his jeep to District Headquarters to bring Dr. Puri immediately for taking charge of the dispensary.

When the jeep arrived at District Headquarters, all the three candidates happened to be present, and they were surprised at Dr. Puri's sudden promotion. The two senior doctors could not understand why Dr. Puri, who was junior to them, had been given this promotion. According to accepted norms, one of the senior doctors should have received this promotion. However, this could not be discussed as the MPW had instructions to bring Dr. Puri immediately to take charge of the dispensary.

When Dr. Puri, accompanied by the CMO, arrived at the dispensary to take charge, the two local doctors were also surprised and upset. The senior most doctor of the two thought that he was being deprived of his rightful claim. He even tried to bring up the issue with the CMO, who quickly and sternly brushed it aside. The CMO left the town after he had installed Dr. Puri as in-charge of the dispensary. While leaving he wished Dr. Puri success in handling very difficult situations.

The departure of the CMO meant the beginning of problems for Dr. Puri. His subordinate doctors, as might be expected, not only refused to cooperate but tried to create problems for Dr. Puri by encouraging other dispensary staff not to cooperate with him. As luck would have had it, there happened to be a compounder in the dispensary who belonged to the same village where the parents of Mrs. Puri lived. Making use of this informal relationship, Dr. Puri requested and readily got full cooperation from the compounder, and also from one of the Ayas of the dispensary who was friendly with the compounder. The three of them worked overtime and somehow were able to pass peacefully the election phase.

After the election, Dr. Puri, who was considered an unlawful claimant of the position by the other doctors, started using his authority to streamline the services at the dispensary and enforcing discipline among the dispensary and medical and para-medical staff. While he got good cooperation from the para-medical workers, he faced problems with his doctor colleagues. The dispensary became a 'divided house' providing poorer and poorer services to the people. The disgruntled doctors at the dispensary floated rumours about mismanagement in the dispensary and misuse of drugs and medicines. It became accepted in the minds of many local people that Dr. Puri was using drugs supplied by the government for patients in his private clinic.

While this was happening in the town, Dr. Puri also faced problems at District Headquarters, where Dr. Mahajan agitated against him. Dr. Mahajan was determined to get back as in-charge of the dispensary and built up pressure on the CMO using his contacts with local leaders for undoing his transfer. In summary doctors at the dispensary and at the District Office teamed up against Dr. Puri. They were convinced that the transfer was a wrong decision of the CMO and were determined to get it reversed.

Once again, the CMO gave into pressure after several representations to higher authorities at the State level. In order to save himself from the wrath of the State authorities and non-cooperation from his medical officers, he decided to reverse his ordres. After all, the election was finished and the crisis of the dispensary was over.

The CMO waited for about two months until the popularly known 'mass transfer season' arrived. This usually happened in the months of April-May in all State departments, including the health department. He made use of this opportunity and transferred Dr. Puri back to the District Office and reposted Dr. Mahajan at the dispensary. On receiving the unexpected transfer order, Dr. Puri was utterly surprised and dismayed. He realised that the CMO had played a game with him and in the process had earned him several enemies in the department. He felt angry, because he had saved the CMO in a crisis situation, and now the CMO did not care for his reputation and career.

Questions for Discussion

1) How far do you agree or disagree with the decision of the CMO and why?
2) Imagine yourself to be Dr. Puri. How would you go about winning the cooperation of the medical and para-medical staff in favour of the decision?
3) List out at least three different ways in which this decision will adversely affect the delivery of health services.
4) How would you describe the management style of the CMO?
5) Imagine yourself to be Dr. Mahajan. How would you have reacted to the decision of transfer to the District Office?
6) How do you feel the decision making under political pressure will affect the climate of the organisation?

CASE 3 : A Quest for Pragmatism *

This is the true story of Dr Sathyan, a Senior Professor of a Medical College in South India. He is a super-specialist and is one of the renowned experts in his field all over India. As a student he had excellent reputation among his classmates and teachers. He was also a well-known sportsman and represented his College, his University and State in sports events for several years. His parents also stemmed from the upper middle-class strata of the society.

We see Dr Sathyan, an energetic and enthusiastic young man of very high personal objectives of academic recognition and expertise, as he enters the services of his State in a Medical College as a member of faculty. He was quite aware of the image of the medical profession and felt uneasy about the reputation several doctors have in matters related to private practice. So he had taken a decision that he would as much as possible get out of the rut that many of his colleagues and teachers have fallen into. Even though, in his opinion, there was nothing wrong in accepting consultation fee for practice undertaken at his home, he felt that this would end up in his being forced to receive money by patients or their relatives in anticipation of special personal care in the hospital. Dr Sathyan tried his level best to live up to his convictions and resisted every instance where he would be trapped in matters related to special patient care. So whenever patients admitted to the hospital or their relatives approach him with money, he used to scold them severly and ask them to leave his house without wasting any time. But then the reaction that he has seen with the people who approached him with money made him think that they had a feeling that he was unwilling to understand problems and their attitudes in connection with the sickness of their dear ones. So Dr Sathyan decided to mellow down by trying to give them opportunity to speak to him and he tried to patiently listen to them and try to convince them that he would not receive any money from them and that he would ask them to take the money back and spend it on more useful things. He also made sure to reassure the patients and their relatives that his attitude towards the money they pay will in no means affect the way by which he will treat the patients.

Once Dr Sathyan explained his problems in accepting money to a by-stander at his home. The by-stander seem to have taken it in good spirit and left his home. This made Dr Sathyan very happy. But within about one and half hours, the man came back with a small bag full of coconuts and a bunch of bananas which might cost Rs 50/-. Now Dr Sathyan was in a dilemma because he thought if he asked the man to take it away, that man would have the problem of selling it and recovering the money. Dr Sathyan also felt that had he accepted Rs 25/- (normal consultation fee at that time), the man would not have gone to buy things worth Rs 50/- and thus he had only made the man spend double the money that he would pay the doctor initially. So Dr Sathyan had no other way but to accept the bag of coconuts and bananas on humanitarian grounds.

Similar experiences made Dr Sathyan wonder whether he was doing the right thing in allowing the patients or by-standers to meet him at his home. So he decided to ask a few of his close friends about the way they were feeling about private practice and also whether he was reaching any where with his principles regarding not acccepting money. He got a lot of advice from his colleagues and thus Dr Sathyan was willing to give a second look at his own principles and practices.

Once a by-stander of one of his patients came to his house and explained all the problems of his relative (the patient), to which Dr Sathyan gave patient hearing. At the end of the conversation he offered Dr Sathyan an envelope. Immediately Dr Sathyan told him: "Will you please do me a favour? I will be extremely happy if you will do it for me".

By-stander: "Doctor, I will only be happy to do anything for you, anything under the sun".

Dr Sathyan: "What I want is that as I put this envelope in your pocket, I want you to turn around and walk out of my house without uttering another word".

The shocked by-stander suddenty burst into tears. Dr Sathyan had to watch this unpleasant scene and had to console the man. He said to himself: "Here I am trying to behave as my close friend advised me. I am only paining my clients more and it is paining me also. Sadly I am not successful either".

* Philip, Oommen, *Management of Hospitals : Text and Cases*, Institute of Management in Government, Trivandrum, 1990.

At this point, Dr Sathyan felt like adopting an advice given to him by another friend. The advice of his friend was for Dr Sathyan to decide to receive money from those who can afford it. In other words, if the patient who offers money is a poor person, he will not accept the money. So when a close relative of a rich patient came to Dr Sathyan's house, one evening with an envelope, he told him that he would accept the money in it if it would in any way comfort the visitor and the patient and that his acceptance of the money would by no way mean that the patient would receive any added benefit in the hospital. The patient would be taken care of like any other patient, with as much effficiency as possible. With this clear understanding, Dr Sathyan accepted the money. As soon as the envelope was placed on the doctor's table, the by-stander said: "Sir, if you will kindly telephone the Blood Bank tomorrow and ask them to issue blood from the Blood Bank, I don't have to donate for which I need to find a donor". At this point, Dr Sathyan got furious and he took the envelope and threw it on the face of the by-stander and asked him to get out of his house.

As years went by, Dr Sathyan was slowly learning a big lesson that none of his sincere efforts could save him from accepting money from relatives of patients and that it was a part of the prevailing culture, for which probably his own profession was responsible.

As Dr Sathyan became a consultant and started receiving reference from other doctors, he started receiving consultation fee. This was done without much hesitation because the Government has allowed consultation at homes. But even in such circumstances, Dr Sathyan faced problems in that once a patient who came to his house for consultation later came up for surgery in the hospital. A day before his admission the patient came to Dr Sathyan's house to remind him that he was going to be admitted on the next day and that he may kindly see him in the hospital. As the patient was leaving his consultation room at home, he left an envelope on the doctor's desk. Dr Sathyan was wondering whether this envelope was to be considered as consultation fee for the examination of the patient at home or bribery for taking care of him properly in the hospital.

Once an emergency case was referred to Dr Sathyan. As the reference was in his name, the patient came to see him at his home. It was evident that the patient has to be operated upon within a couple of days. He also left an envelope which could have been either for consultation at home or as a bribery for the surgery to be conducted shortly. Dr Sathyan was again confused. He would not accept the envelope nor could he reject it.

Once a referral case of emergency came to Dr Sathyan at his home while he was away. The patient straight away went to the hospital and saw the duty doctor and got himself temporarily admitted. The next day he came to Dr Sathyan's consulting room, with the reference letter and, of course, an envelope. Dr Sathyan was again agitated as to whether the envelope the patient gave him contained consultation fee or bribery.

As years went by, his experience helped Dr Sathyan's conscience grew harder and he didn't seem to bother whether any envelope given to him was consultation fee or bribery. He still doesn't want to accept bribery, but he has no way of discerning whether the money he receives is consultation fee or bribery.

Questions for Discussion

1) What is the conflict Dr Sathyan is facing regarding consultation fee? Critically evaluate.
2) Is it right to justify the confusion in Dr Sathyan's mind regarding consultation fee?
3) If you were Dr Sathyan, what would have been your way of looking at the problem and the solution thereof?
4) Does Dr Sathyan need any counselling or any other intervention to come out clear of his conscience?
5) Would you suggest any systemic improvement in the organisation so that any other doctor may make his/her decision without bothering his/her conscience?

CASE 4 : Learn a Lesson from me *

"I have been working in the Medical College Hospitals for the last 15 years as a doctor, and have come to the conclusion that if I am conscientious and honest, I would not be in a position to judiciously discharge my duties."

"A good example is the case of admissions, that too in the Casualty Department. There, even for minor ailments, people expect admission and treatment as in-patients, and the moment one refuses to admit them, he becomes public enemy number one. He is also accused of non-admittal due to non-payment of bribery. It is interesting to see how I learned my good lessons."

"While I was working in the Casualty Department at Medical College Hospital, Trivandrum as second-on-call, on one afternoon after attending to a serious accident case, I was confronted by a lady of about 72 years old. She had a minor head injury. In my judgement, she needed only simple dressing, and so I instructed the staff to give her dressing, and she had gone from the Casualty. About half-an-hour later, I was confronted by a middle aged man with a complaint that I had not admitted his mother who had a serious head injury. Amidst his shouts, I tried in vain to explain to him the situation. He soon left the Casualty Department warning me of the consequence."

"In about ten minutes, a small procession of about ten khaki-clad men came to the front entrance of the Casualty shouting slogans and abusing the doctor for partiality and bribery. The procession dispersed itself in a few minutes. And we thought the trouble for the day was over."

"Exactly half an hour later, the Hospital Superintendent came to the clinic where I was attending to emergency services and called me out. We moved to another room where he told me that the Minister of Health had received a serious complaint through the local MLA and some union leaders of KSRTC (Kerala State Road Transport Corporation). Then only I realised that the man who threatened me was a staff of KSRTC and that the woman with the head injury was his mother."

"Subsequently I was put under suspension. A detailed enquiry was conducted and finally I was acquitted of all charges."

"I had another experience when I was working in the Casualty Department of Medical College Hospital, Kottayam. While I was busy with emergency services on one afternoon, a middle-aged man approached me with a cold and cough. After preliminary examination, I prescribed some cough syrup, and told the patient to visit the Out-patient department the next day. The man got really furious and started shouting at me. He loudly asked me whether I was not admitting him because he didn't give me money. He went away without the prescription and we never saw him again."

"Slowly I was learning my lessons. Now-a-days, when patients come to me, I try my best to admit them irrespective of the fact that they don't need admission and that there are tremendous lack of facilities to accommodate even emergency cases."

"Recently, while working in the Casualty Department of Medical College Hospital, Calicut, I admitted a man who came with a complaint of cold and cough. I had examined his lower and upper respiratory system. He seemed to be happy that I had used my stethoscope sparingly on him. While admitting him, I also instructed that his blood be examined, and that he be given a bottle of glucose, and that he may be administered with penicillin injection for five days. He was discharged after five days."

"You may probably think that my attitude to my profession is very bad. But I have learned from experience that nobody will protect me, so I should protect myself. Now that I have learned by big lessons, and that I know how to play games, I am enjoying my job a lot better and my tension and frustrations have diminished considerably, and that my patients seem to be enjoying me very much."

Questions for Discussion

1) Is this doctor justified in having a negative attitude to work? Why or why not?

---

* Philip, Oommen, *Management of Hospitals : Text and Cases*, Institute of Management in Government, Trivandrum, 1990.

2) How could this doctor have avoided the situation to deteriorate to this level?

3) What policy should the hospitals adopt so that the employees will not degenerate and that their attitude will not degenerate and that their attitude will not be negative?

4) What kind of training programme or HRD intervention would you like to suggest for this organisation to improve and revive attitudinal problem?

5) In your opinion what is the root cause of such negative attitude to work of the doctor? Do you think the organisational climate is responsible? Critically evaluate.

CASE 5 : The Boomeranged Medical Certificate *

April 1st is universally "celebrated" as All Fools Day. It is only coincidental that many are meaningfully fooled by the turn of events of the day. Such an incident took place at General Hospital, Ernakulam, in 1983.

Dr Chandra Kumar, the senior physician was taking his wards rounds in the morning. As he was moving from bed to bed at about 9.30 am, one of his nursing assistants told him that a doctor from the Taluk Headquarters Hospital, North Parur, was waiting to see him urgently. Dr Chandra Kumar completed his examination of the particular patient he had started examining, and excused himself from the ward to see the visitor. He went to the side room of the ward where Dr Suresh from the Taluk Headquarters Hospital, North Parur was waiting anxiously to see him. Dr Suresh was not previously known to Dr Chandra Kumar. So he introduced himself and said "Well Doctor, what can I do for you? You seem to be very much agitated".

He said "Sir, I have got a very serious problem only you can help me. Please do something to save me".

"Well, Dr Suresh, what is the problem? Let me see whether I can help".

Then Dr Suresh started narrating his problem. Dr Suresh has been working at the Taluk Headquarters Hospital, North Parur as an Assistant Surgeon for the last three years. He had developed for himself a good image within a short period in and around the hospital. He also has a fairly good-size private practice.

One day one of his hospital attenders, Smt. Sulochana, 45 years old, came to him and asked him to help her to secure a transfer to a Primary Health Centre near her home at Cherai, where she will have much lighter workload and no night duty. In order for her to get such a transfer, she requested a medical certificate saying that she has chronic rheumatic problem and that it was difficult for her to walk around and do her work. Smt. Sulochana presented her case in a touching manner to Dr Suresh. Dr Suresh felt sympathetic towards her and felt it his responsibility to oblige the hospital staff wherever possible. So within a few days, after careful thinking, he gave her a medical certificate stating that Smt. Sulochana is a chronically rheumatic patient and that because of her illness she cannot do any manual work and cannot walk properly.

This was written even when Smt. Sulochana was healthy and had never suffered from rheumatism. Dr Suresh gave the certificate in good faith, feeling that he had helped one of his subordinates and forgot about this whole episode until the present problem crept in.

Smt. Sulochana got a mercy petition written on her behalf by the Lay Secretary which she sent to the Honourable Minister of Health, enclosing the medical certificate (through proper channel), requesting for a transfer to the Primary Health Centre, Cherai, which was very close to her home. When the file reached the Honourable Minister of Health with comments from the Health Secretary, the Minister himself wrote the order on her application which reads as follows:

"The medical board constituted by the District Medical Officer of Health (DMOH), Ernakulam will examine Smt. Sulochana within 48 hours and if the medical certificate is correct, the services of Smt. Sulochana may be terminated on medical grounds. If the medical certificate is false, disciplinary action may be taken against the Doctor who had issued the false medical certificate."

Unfortunately, the comments from the Minister came two days ago and that the emergency meeting of the Medical Board was fixed for the 1st April. The membership of the board included Dr Chandra Kumar and two other doctors from the District Hospital, Ernakulam, with the DMOH as the Chairman.

As they were still talking, Smt. Sulochana also appeared at the door of the side room, introduced herself and started sobbing and petitioning to Dr Chandra Kumar to save her. Dr Suresh and Smt. Sulochana had already seen another member of the Medical Board. They wanted Dr Chandra Kumar also to help them to get out of this extremely difficult situation.

* Philip, Oommen, *Management of Hospitals : Text and Cases*, Institute of Management in Government, Trivandrum, 1990.

The problem before the Medical Board was a difficult one. If the Board concludes, as can only happen, that Smt. Sulochana does not suffer from rheumatism, the medical certificate will prove itself to be false and that disciplinary action will have to be taken against one of their junior colleagues, Dr Suresh. If the Board concludes that Smt. Sulochana is actually suffering from rheumatism, in order to save one of their colleagues, the poor Smt. Sulochana will lose her job.

Smt. Sulochana pleadingly told Dr Chandra Kumar that she only wanted a transfer and she never thought that such an action would cause so much of a problem. She said "Sir, please help me somehow. If I lose my job, my whole family including my disabled husband will starve because we have no other income". At the same time Dr Suresh said, "Sir, please do something to get me out of this trouble, as I did this in good faith and only wanted to help the poor woman, out of nobility and sympathy".

Another problem that the Medical Board faced was that if both of these people were not helped, the Unions will trouble them as both were members of strong Unions in the Health Services. Dr Chandra Kumar was in a dilemma. He got really confused and was wondering as to what to do. Anyway he told Smt. Sulochana and Dr Suresh that he would look into the matter, study the files and see what he could do in cooperation with his senior colleagues in the Medical Board.

Questions for Discussion

1) What is the problem in the case, explain?
2) Since Dr Chandra Kumar knows the case, what are the alternatives available with him?
3) If you were Dr Chandra Kumar or a member of the board, what decision would you have taken and why?
4) Do you think the HRD policy of the organisation is responsible for such a situation? Would you recommend any change or intervention in the policy to help out both Dr Suresh and Smt. Sulochana?

CASE 6 : Whither Practical Training *

Teaching Hospitals are especially meant to provide practical training to medical and paramedical students. The clear understanding between trainers, trainees, other functionaries, patients and by-standers in a teaching hospital is that patients will be subjected to examination and treatment by various levels and types of medical and paramedical students along with staff. The trainers normally help, guide, counsel, correct, monitor and evaluate students as they acquire practical training in the teaching hospitals. But all concerned are probably not adequately aware of the attitude of patients, by-standers and the trainers about the viability of subjecting oneself, one's relatives or one's patients to semi-trained or partially trained students no matter which category they belong to.

For the nursing students of the Nursing College attached to the Medical College, Calicut, there are a lot of interesting experiences in this regard. They seem to feel that they are attached to their supervisors and are basically loyal to them only. They are alleged not to have adequate loyalty to the ward sisters or the hospital in which they are getting their training. They generally feel that they are ignored by the medical and paramedical staff of the hospital and that they are often found fault with by other functionaries for what they are or they are not responsible for. They usually feel that they are second class citizens in the hospital.

On other hand, the medical and paramedical staff have the feeling that the nursing students do not take their practical training very seriously and that they show only loyalty to their College and not to the hospital.

There have been arguments and counter-arguments by the college staff and the hospital staff about the ineffectiveness of practical training for nursing students. But, Professor Sulochana was not willing to stay in either of these groups to accuse anybody for any lapse of any sort. She has been very conscientious and devoted and always wanted to make sure that her nursing students are adequately trained to take up the challenges of any hospital floor any where in the world.

One of Professor Sulochana's students, by the name of Sujatha, a second year BSc Nursing student was posted to ward number 5 of the Medical College Hospital, Calicut. As part of her practical training, at that time while working in ward number 5, she was attending to a patient by the name Soman, 52 years old, among many other patients (Soman had undergone an exploratory laparotomy for acute abdomen). Sujatha had already got adequate exposure, during her first year of studies, in fundamental nursing procedures and need-based care. She has also been exposed to pre and post-operative care of patients with abdominal surgery during the beginning of the second year. Thus Sujatha was expected to and was technically capable of providing total patient care to Soman on the basis of her own assessment of the patient's needs.

Soman was admitted a few days ago and Sujatha had the opportunity to look after him during the pre-operative period, on the day of the operation and the first post-operative day, providing necessary nursing services like administering prescribed drugs, injections, intra-venous fluids, maintaining fluid intake and output etc. She has also helped him with movements/exercises for limbs and post-operative breathing exercises, to prevent complications like phlebitis and hypostatic pneumonia, apart from attending to the hygienic and comfort needs of the patient. These were planned and undertaken in consultation with the ward sisters and also Professor Sulochana who was her supervisor.

On the second post-operative day, at about 8.30 am, Sujatha took her rounds and came to Soman's bed. She realised that the intravenous drip was removed and kept aside the patient. She took care of some of the hygiene needs of the patient. After attending to the hygiene needs and making the patient comfortable, she took the vital statistics and recorded those, to be normal. The patient was cheerful and making progress, the by-standers were observed to have been happy with the progress made by the patient and the care Sujatha was imparting.

When Sujatha looked into the case sheet she found that the intravenous drip for Soman had to be continued. She immediately came to the ward sister's room where Professor Sulochana and the ward sister were chatting. Immediately Sujatha consulted the need for continuing the intravenous drip and went back to the patient with a new drip set. Professor

* Philip, Oommen, *Management of Hospitals : Text and Cases*, Institute of Management in Government, Trivandrum, 1990.

Sulochana walked with her to the patient and helped her in starting the drip. As she was piercing the patient to introduce the needle for the drip, there came a loud voice from behind:

"Sister, I don't want this student to give intravenous drip for my patient".

Professor Sulochana and Sujatha got startled for a second, and lifted their head to find that the Professor and Head of the Department of Gastroenterology was standing at the front of the bed. The shocked and fearful Sujatha just could not be successful in peircing the patient properly for the drip. As the student nurse wanted assurance and support, Professor Sulochana took over the needle and started the drip. In the meanwhile, the Professor and Head of the Department (Dr Narayanan Kutty) was fuming and grumbling. He was even shouting at Professor Sulochana. He also called the ward sister and shouted at her, but the ward sister replied nothing. In the meanwhile, Professor Sulochana completed the work of the drip and turned to Dr Narayanan Kutty and said: "Sir, our students practice these procedures only in the presence of the supervisors and also after consultation with the ward sister. As you can see, I am standing here and helping her".

Dr Narayanan Kutty: (furious) "I asked you not to do it. I don't want students to practice on my patients".

In the meanwhile, a few undergraduate students, registrars and post graduate students assembled there.

Professor Sulochana: "Sir, this is a teaching hospital, and if the students are not allowed to practise, how can they learn and gain confidence in these techniques? But they practice only in the presence of the supervisor".

Dr Narayanan Kutty: "Madam, you think I will allow a surgeon trainee (postgraduate) to do a Gastrectomy in my presence simply because this is a teaching hospital? Don't you try to argue your case with me. I will not allow you or your students to practice on my patients".

Professor Sulochana: "Sir, would you please give me one good reason for it. In my opinion this patient is making tremendous improvement and we are giving him great care and the by-standers and the patient have not so far complained".

Dr Narayanan Kutty: "I don't want to talk to you any more nor do I want to listen to you".

Dr Narayanan Kutty turned to the ward sister and said: "Sister, I don't want the nursing students to practice on my patients, you understand".

The ward sister shook her head in the affirmative.

This has created quite a scene in the ward. The patient and the relatives didn't know how to react. In fact, they seem to have felt sorry for this nursing student who looked after the patient for the last few days. The Medical students who assembled there with Dr Narayanan Kutty also could not respond.

The nursing students felt thoroughly humiliated and frustrated. As they were prevented from practice and they are rebuked in front of other professionals, they immediately left their work and gathered in the duty room with a feeling of guilt and shame. They asked for permission to leave the hospital, and requested that they be posted in another ward.

Questions for Discussion

1) Evaluate the role played by Dr Narayanan Kutty, Professor Sulochana and Sujatha in this case.
2) Is Dr Narayanan Kutty right in asking that nursing students be kept out from practising on patients?
3) How does this incident affect the image of the Professionals among the patients and by-standers in the Medical College Hospital, Calicut?
4) How would you handle this conflicitng situation, as an administrator of the hospital?
5) Do you think the system is not in place in the hospital and it needs proper restructuring? Explain why.
6) Is this the right kind of training environment for overall development of human resources?
7) Would such incidents affect the morale and motivation of trainees and will lead to not-so-sound decision-making?

CASE 7 : The Maulavi Supports Family Planning *

The Primary Health Centre Sultanpur had Dr Swarup as Medical Officer in-charge, Sri Avtar Singh as Block Extension Educator (BEE), four Lady Health Visitors (LHVs), ten Auxiliary Nurse Midwives (ANMs) and 14 Male Health Workers. Dr Swarup was worried because he was falling behind the target of sterilizations fixed for his PHC. He called a meeting of his staff to review progress of family planning target achievement. The meeting was organised to identify workers and villages giving very poor response. Dr Swarup wanted to make use of suggestions by his staff for improving the performance of villages with poor response.

In this meeting concern was expressed because in the past eight months the relatively big village of Sultanpur had no case of sterilization. Transferring another male health worker to Sultanpur village was one of the several suggestions made at the meeting. Dr Swarup considered all the suggestions and decided in favour of transferring an additional health worker. He presented this decision of transfer in the form of a challenge, which motivated several good male health workers to volunteer for the transfer.

The BEE explained in the meeting that Sultanpur village was mostly populated by Muslims, and one of the reasons for the poor performance was the fact that Muslims as a group were not coming forward to accept the family planning programme. After further discussion, Dr Swarup selected one male health worker, Mr Rajababu, who had excellent family planning performance records in the past several years, as the new health worker for Sultanpur. Mr Rajababu was given the transfer order at the end of the meeting.

Next week Mr Rajababu with his family and all their belongings shifted to Sultanpur. The village was fairly big with a population of about 5000 people. Roughly 95 per cent of the population were Muslim. Illiteracy in the village was very high. A large majority of the population worked as poor agricultural labourers. There was a big, important Jama Masjid in the centre of the village. The maulavi of this masjid, Mr Farooqi, was a highly respected person in the village and several other neighbouring villages. The Jama Masjid and its maulavi dominated the happenings within the village. The maulavi also ran a Madrasa for village children, and practically every family sent their children to this school. In case of severe illness or misfortune, Mr Farooqi was invariably consulted and approached for his blessings. In all important matters such as births, deaths, marriages and divorces people sought his advice. He was invariably involved in all major decisions in the village.

Mr Rajababu decided, on the basis of past experience, that the only way he could make family planning services available to the community was through their recognised leader, Mr Farooqi. He also knew that success depended on giving highest regards and respects to the religious values of the population. Therefore, one of the first things he did was to contact Mr Farooqi, introduce himself and explain the type of health services he can give to the village. He explained that his programme gave special emphasis to the health of women and children. He assured Mr Farooqi that before doing anything in the village, he would ask his approval and also his involvement. Mr Rajababu also shared his concern about the poverty and very poor health of mothers and children in some families. The mention of children touched a sympathetic cord in the heart of Mr Farooqi. Very recently, several children of the village had suffered a heavy attack of diarrhoea and measles. Some children had even died. But Mr Farooqi asked how a male can work among the women and children. Mr Rajababu assured him that a clinic for mothers and children could be organised with the assistance of a lady health worker. After more discussion, it was agreed to begin such a clinic on a weekly basis.

The weekly clinic soon became popular. Acceptance of the EPI programme was quick, because of the recent sad experiences with the epidemic of diarrhoea and measles. Mr Farooqi and Mr Rajababu developed mutual respect and confidence. One day Mr Farooqi asked Mr Rajababu about the possibility of posting a female health worker permanently at the clinic. Mr Rajababu took Mr Farooqi to Dr Swarup, and in the course of their discussion, Dr Swarup agreed to keep a lady health worker permanently at the clinic and make it a health sub-centre. During the inauguration of the sub-centre, Mr Farooqi was given the place of honour on the dias. On that day Mr Rajababu distributed free literature to

* Roy, Somnath *et al.*, *Case Studies in Health Management*, National Institute of Health and Family Welfare, New Delhi: 1987.

the guests explaining about the maternal and child health programme, including the need to space children for better health of both mothers and children. He distributed the literature quietly and the guests were allowed to carry home any booklet they wanted.

One evening, about a week after the opening of the sub-centre, Mr Rajababu was surprised to find Mr Farooqi coming to his home. Mr Rajababu welcomed Mr Farooqi warmly in his home, and then took the initiative of talking about how family planning was necessary for the health and economic welfare of the families in the village. He specifically referred to poor families with a large number of children and their pitiable condition. He mentioned about the family planning services that could be made available at the sub-centre, and encouraged Mr Farooqi to talk about family planning with people in the village. Mr Rajababu also gave examples of other villages where family planning was being accepted by people of all religions, castes and economic groups.

About a month after the discussion, Mr Farooqi agreed that this sub-centre could give family planning services to women who needed it. He gave his permission only after Mr Rajababu assured him that there would be no unusual propaganda.

Questions for Discussion

1) How does leadership make a difference, in deciding right or wrong for a group?
2) How do you see the role of Dr Swarup?
3) What differences do you find in the leadership of Mr Farooqi and Mr Rajababu?
4) Does effective leadership and decision making lead to higher motivation?
5) From a management point of view, what are the advantages and disadvantages of working through traditional leaders such as Mr Farooqi?

NOTES

UNIT 1 ACCOUNTING CONCEPTS AND APPLICATION

Structure

1.0 OBJECTIVES

After going through this unit you should be able to:

- describe the process of accounting;
- explain the objectives of financial reporting;
- explain and apply the basic concepts of accounting in your health system; and
- distinguish between the types of accounts and their applications.

1.1 INTRODUCTION

It is somewhat unusual to begin a text on Financial Management with a discussion of Accounting principles and concepts and one may ask "Why do so here?" The answer quite simply, is that if hospital managers are to understand the value of financial management for improved hospital operations and feel comfortable in its use, they must have a full understanding of the financial workings of the hospital. The best way to obtain such an

understanding is to begin with a review of the definition of Accounting, the objectives of financial reporting and the related Accounting concepts and conventions. An understanding of these is critical to the knowledgeable use of financial data, for they determine the nature and character of the financial information that hospital managers receive. Therefore, if managers are to be able to understand, evaluate property and utilise financial data. They must first understand the objectives that guide the collection and presentation of these data.

1.2 WHAT IS ACCOUNTING

Accounting is often called the language of business. The basic function of any language is to serve as a means of communication. In this context, the purpose of Accounting is to communicate or report the results of business operations and its various aspects. Accounting has been variously defined and one commonly accepted definition is "Accounting is the art of recording, classifying and summarising in a significant manner and in terms of money, transactions and events which are in part at least, of financial character and interpreting the results thereof."

Another less restrictive definition is "Accounting is the process of identifying, measuring and communicating economic information to permit informed judgements and decisions by the uses of information."

1.3 ACCOUNTING PROCESS

The process of Accounting involves the following steps:

a) Data creation and collection which provide the raw material for Accounting. The data collected is 'historic' is the sense that it refers to events that have already taken place.

b) Recording of data, which is done in accordance with the laid down concepts and conventions of Accounting as stated later in this unit. A large number of transactions or events have to be entered in the books of original entry (journals and ledgers.) The recording and processing of information usually accounts for a substantial part of total accounting work. The processing methods employed for recording may be manual, mechanical or electronic computer are generally taking to the primary method of recording and processing.

c) Data evaluation is regarded as the most important activity in Accounting these days. Evaluation of data includes controlling the hospital activities with the help of budgets and standard costs, analysing the flow of funds and analysing the accounting information for decision making purposes by choosing among alternative courses of action. The analytical and interpretation work of Accounting may be for internal or external use and may range from snap answers to elaborate reports. Data evaluation has another dimension and can be known as auditor work which focuses on verification of transactions as entered in the books of Account and authentication of financial statements. Auditing will be discussed separately as a different unit in this block.

d) Data reporting consists of two parts–external and internal. External reporting refers to the communication of financial information viz. earnings financial and funds position about the hospital to outside parties i.e. trustees, Government agencies and regulatory bodies. Internal reporting is concerned with the communication of results of financial analysis and evaluation to hospital management committee for decision making purposes.

1.4 OBJECTIVES OF FINANCIAL REPORTING

The objectives of financial reporting are as follows:

a) It should provide information that is useful to present and potential investors, creditors, and other users in making national investment credit and similar decision.

b) It should provide information about the economic resources of an enterprise, the claims to those resources and the effects of transactions, events and circumstances that change resources.

c) It should provide information about an enterprise's financial performance during a period.

d) It should provide information about how an enterprise obtains and spends cash, about its borrowing and repayments, about its capital transactions and about other factors that may affect its liquidity or solvency.

e) It should provide information that is useful to managers and directors in making decision in the interest of the enterprise and the owners.

The emphasis of these objectives is on the information needs of external users common to for profit publicly held enterprise or corporate sectors. However, you may substitute the terms hospital for enterprise and community for owners and the objectives are equally applicable.

1.5 ACCOUNTING CONCEPTS

Any activity that you perform is facilitated if you have a set of rules to guide your efforts. When you are driving your vehicle you keep to the left, you are infact following a standard traffic race. Without the drivers of vehicles following this rule, there would be chaos on the roads. Similarly without general rule or guides for the recording of business activities and the preparation of accounts, it would be impossible for the accounting information to be understandable and useful to various parties. There would be no common basis for recording transactions. Similar transactions if accounting records are to be understood, must agree at least in terms of Accounting records, similar results. If this end is to be attained certain basic concepts must be used in preparing accounting records. Accounting practices have developed over a long period of years. During the time accountants have accepted and adopted several basic concepts as fundamental guides that define the manner in which accounts should be kept.

Presented below are basic accounting principles or concepts, with which hospital managers should be familiar and that they should understand if they are to be able to use accounting data and reports. It should be pointed out that accounting is not a static art, these principles are continually being questioned and reviewed and in time will be modified. However, they are currently the accepted guidelines, and while the reader may question the propriety of some, he or she should at this point accept and attempt to understand these principles so as to be able to utilise accounting data and financial reports knowledgeably.

1.5.1 Entity Concept

In accounting we make a distinction between business and the owner. The hospital or for that matter any business is named as an entity capable of taking economic actions. The hospital is an entity separate and distinct from its employee contributors and governing board. Accounts are kept for this entity and not for the persons associated with the entity.

1.5.2 Continuity Concept or the Going Concern Concept

It's a corollary to the entity concept, accountants have also assumed that the entity will continue to operate for a long time in the future unless there is good evidence to the contrary. The hospital or the enterprise is viewed as a going concern to continue in operation at least in the foreseable future. The persons associated with the entity may come and go but the entity will remain. Thus in preparing statements and reports the accounting method and valuations should reflect the continuity assumption instead of the assumption that the entity will be liquidated and its assets and liabilities should be valued at their liquidation price.

1.5.3 Cost Valuation Concept

The resources in terms of land, buildings, machinery etc. that a hospital owns are called assets. The money value, that are assigned to the assets are derived from the cost concept. This concept states that an asset is worth the price paid for or cost incurred to acquire it. Thus assets are recorded at the original purchase price and this cost is the basis for all subsequent accounting for the assets. The assets shown on the financial statements do not necessarily indicate that present market costs (or market values). This is contrary to what is often believed by an uninformed person reading the statement or report. The term book value is used for the amount shown in the accounting records. In case of certain assets the book and the market values may be similar, e.g. cash. In general the longer an asset has been owned by the hospital, the lesser are the chances that the accounting or the book value will correspond to the market value.

Admittedly, the use of this cost as the basis for valuation has some drawback. Overtime, especially during periods of fluctuating economy, the value of an item can vary substantially.

In this situation, the accounting value of an item as indicated earlier will accurately referral only the value of an item as of the time it is acquired and will not show its current months.

Recognising the problem some have argued that a different basis be used–a basis that should at all time, show the current value of the operation or asset. Cost valuation, has however the important advantage over all other basis of valuation in that it is determinable, definite, objective and verifiable. It is not a matter of conjecture or opinion and judgement and it would be a costly and laborious task for determining the value of each item acquired at the end of an accounting period. Thus, if accounting records are to provide consistent and factual figure cost should be used as a basic of valuation.

The cost concept does not mean that all asset remain on the accounting records at their original use for all times to come. The cost of an asset that has a long but linked life in systematically reduced during its life by depreciation i.e. a process by which the cost of the asset is gradually reduced or written off by allocating a part of it to expense in cash accounting period the purpose of depreciation is to allocate the cost if an asset over its useful life and not to adjust its cost so as to bring it closer to the market value.

1.5.4 Double Entry Concept

The Accounting records should not only reflect on a cost basis of all transactions of the entity but also be constructed in such a manner as to reflect the two aspects of each transaction i.e. the change in asset forms or the change in assets and the source of financing–liabilities for e.g. if a hospital acquires an ambulance for cash not only the cash account be adjusted but also an entry must be made to show the acquisition of a fixed asset i.e. the ambulance. This is one concept with which every hospital manager should be familiar for it is really no more than just requiring that the debit entries balance the credit entries.

1.5.5 Accrual Concept

Just as the cost valuation concept provides the guide for recording assets and liabilities, the accrual concept provides the guide for accounting the revenue and expenses. Simply stated the accrual concept rule says that:

i) revenues and losses should be recorded in the period in which they are realised, and

ii) expense are to be recorded in the period that they contribute to operations.

Realisation of its revenue or loss mean that the gain or loss must be definitely established and the amount must be determined before an accounting entry is made. Thus, for e.g. assets must be sold before the gains or loss from holding the assets is entered into the accounting period.

In allocating expenses, a different guide is used i.e. expenses are recognised in the period during which they contribute to operations. This notion can be illustrated by assuming that employees are paid in January for the work performed in December. The expense should be allocated to December, the month in which the contribution to operations was made, not to January.

The use of these two rules allow accountants to allocate revenue and expenses to the proper accounting period.

1.5.6 Matching Concept

The matching concept build upon the logic underlying the accrual concept. The use of realisation and contribution rules allows accounting to bring together related income and expense in an accurate manner in the same accounting period. If the results of a particular operation are to be described objectively, not only the income and expense of the same accounting period be brought together but also associated revenue and expense items must be matched in order to properly determine the income.

If it were not necessary to match related items of revenue and expenditure, then it would be possible to manipulate income from different types of activities to produce whatever type of operating picture is desired. Thus, it is only by matching expense against related revenue, the results of a particular operating activity can be accurately and objectively presented.

Activity 1

Study the final accounts of your own hospital or any other hospital that you are familiar with. Note how the various concepts just studied by you have been applied in preparing these accounts.

1.6 ACCOUNTING CONVENTIONS

The foregoing concepts should not be regarded as infallible rules to be followed in every situation. Instances may arise wherein it would be desirable to make certain exceptions in the application of these concepts. Additionally, in practice, the above concepts are modified by certain conventions. The most important of which are presented below.

1.6.1 Relevance

Accounting is not intended to capture information from an infinite and unstructured range of sources. The information must be logically related to management decisions and to financial viability to be relevant. Accounting information can be utilised either by improving the decision maker's ability to predict a future occurrence or by confining an earlier judgement. In both situations, the relevance of the information contributes to the ultimate certainty of the decision and its potential outcomes. Thus, for Accounting information to be relevant it should be capable of helping users to form a more precise assessment of their past or future efforts. Timeliness in a necessary aspect of relevance. Untimely data are irrelevant because they have no capacity to influence decisions. If information is not available when it is needed or becomes available only after it no longer has any value, it lacks relevance.

1.6.2 Reliability

In being reliable, Accounting information warrants only what it purports to represent verifiable information for establishing informed decisions. Reliability does not guarantee certainty in decision making. Accounting merely functions as a means of representing the economic decision and financial condition of the enterprise through the selection of alternatives, yet generally accepted methodologies.

1.6.3 Materiality

There are many activities in the hospital which are of trivial and insignificant nature and the cost of recording and reporting such events will not be justified by the usefulness of the information desires. In other words the accounting report should not attempt to reflect a great number of events that are so insignificant that the cost of recording them are not justified by the benefits received. For e.g., the matching principle requires that expenses be matched against relevant revenues. However, in a hospital, an significant amount of revenue may be obtained from the selling of scrap material, adherence to accounting concepts would require that the expense involved in collecting and selling such scrap material be offset against the revenue obtained. However, unless the revenue from the sale or the expenses related to those revenues are of real importance it is neither particularly helpful nor necessary to adherence strictly to theory. The point involved here is of materiality.

Where to draw the line between material and immaterial events is a matter of judgement and common sense. There are no hard and fast rules in their respect. It is desirable to establish and follow uniform policies covering such matters.

1.6.4 Comparability and Consistency

In practice there are several ways to record an event or a transaction in the books of Account, e.g. there are several methods to charge depreciation on an asset or of valuing inventory. The consistency concept requires that once an organisation has decided one method and has used it for same time, it should continue to follow the same method or procedure for all subsequent events of the same events character unless it has sound

reason to do otherwise. If any change is made the departure and its effect must be clearly indicated in the financial statements in the year of the change.

If the full benefits of Accounting reports are to be obtained, one must be able to compare reports across similar organisations and between years. To attain such comparability the reports must be prepared on in consistent basis.

1.6.5 Conservatism

This concept is often stated as "Anticipate no profit, provide for all losses. Only recently has the accounting profession realised that this introduces a performance has that conflict with the other accounting conventions. Conservatism is now applied in conjunction with the measurement of the uncertainty attached to the decision alternatives of a specific situation. If the value of an asset or an income item is in doubt and any of the possible estimates is likely to occur, then conservation dictates the selection of the least optimistic estimate. If any estimate is more likely to occur than the others, then conservatism is not applicable to the situation.

1.6.6 Periodicity Concept

Although the results of operations of a specific enterprise can be known precisely only after the business has ceased to operate, its assets have been sold off and liabilities paid off, the knowledge of the results periodically is also necessary. Those who are untested is the operation of the hospital is business, obviously cannot wait till the end which may not come at all the requirements of these parties, therefore, force the accountant to report for the change in the health of a firm or enterprise for short time period. These time periods is actual practice very, though a year is the must common internal and community adjusted is the financial year concept.

1.7 CRITICAL APPRAISAL OF THE CONCEPTS AND CONVENTIONS

While going through all these concepts, probably you have developed a feeling that they come in conflict with each other. You are right. We illustrate this by considering some of these concepts in the content of valuation of hospital properties. Suppose a hospital acquired a piece of land in 1985 for a price of Rs. 6,00,000. Hospital premises were constructed in 1986 and the hospital operations commences in 1987. The hospital has been a great success with a profit profile for the past 12 years. The Balance Sheet for the year 1999 is being prepared and 'Land' is required to be valued. The estimated current market price of the land i.e. 60,00,000.

Should you recommend that the land be valued at Rs. 60 lakh. The answer is 'No' obviously. Land would be carried on the Balance sheet at its original costs of Rs. 6 lakh only. This decision is supported by several of the concepts discusses in this unit. In the first place, the stability of purchasing power of money implies in the *cost valuation concept* prevents us from recognising accretion in values as in result of changing price levels. The *accrual concept* will not allow unrealised profits to be included as long as the land is held by the hospital and not sold away. You may note that the continuity and the *ongoing concern concept* makes any possible market value of land for balance sheet because the hospital has to continue in business and land will be needed by it for its own use. In this connection, it could be argued that if land were shown on the balance sheet at its estimated current market value, the owner might decide to discontinue the hospital sell the land and retire, the principle of objectivity is now introduced into the argument. It can be easily seen that in a situation like this the cost of acquisition of land at Rs. 6 lakh in 1985 is the objective fact because it is based on the transaction that actually took place and this objective evidence is capable of being verified in contrast the estimate of the current market value to give may be suspect. It raises many questions. Do you have a market quotation for an identical plot of land. Has a similar plot of land been sold recently and can we pick it up as a verifiable evidence of the current market price? Further complications may be noticed if buildings and facilities have been erected on the plot of land. Is it possible to estimate the value of land without factory building and other facilities constructed on it. The answer is a flat 'no' and the *conservation concept* will deter you from accepting an estimate of market value since it cannot be ascertained with reasonable accuracy.

Activity 2

1) Name the accounting convention isolated if any in each of the following situations:
   a) The Rs. 1,00,000 figure for inventory on a balance sheet is the amount for which it could be sold on the balance sheet date.

      Hospital A does not change annual depreciation preferring instead to show the entire difference between original cost and process of sale as a gain or loss in the period when the asset is sold. It has followed this practice for many years.

2) Answer whether the following statements are True or False:
   a) The Materiality concept refers to the state of ignoring small items and values from accounts.
   b) Timeliness is not an important aspect of relevance.
   c) Conservation concept forbids the inclusion of unrealised gains but advocates provision for possible losses.
   d) Objectivity principle requires that only the information based on definite and verifiable facts be recorded.
   e) Periodicity concept envisages that accounting information should be prepared on a consistent basis from period to period and in these periods there should be consistent treatment of similar items.
   f) Reliability concept guarantee certainly in decision making.

1.8 TYPES OF ACCOUNTS AND THEIR APPLICATIONS

Accounts are divided into the groups:

a) Personal Account

b) Impersonal Account which is further divided into:
   i) Real or Property Account
   ii) Nominal or Fictitious Amount

1.8.1 Personal Account

Relate to persons or organisation which are distinct legal entities. These include patients, creditors and employee account.

Rule: Debit the receiver and credit the giver. Let us illustrate an example, A sold goods to B for Rs. 5000/-

Explanation: Here there are two parties affected. Mr. A is selling the goods and Mr. B is at the receiving end. In the books of A the entry will be as follows.

A Account Rs. 5000/-
To Goods Rs. 5000/-
In the books of B the entry will be as follows
Goods Account Rs. 5000/-
To A Rs. 5000/-

The point to note is that in the book of A, B is debited and goods account is credited. A should not credit himself in his own books. Likewise similar treatment is given in B's books.

1.8.2 Real or Property Account

Aspect Accounts are formal Real Account. Here the properties like cash book, buildings furniture and other allied assets are included.

Rule: Debit what comes in and credit what goes out.

Example: A hospital purchased furniture for Rs. 2,00,000/-

Here there are two heads-one is furniture and the other is cash.
The entry will be as follows.

Furniture Account Rs. 2,00,000/-
To Cash 2,00,000/-

Explanation: Furniture account is debited because it is coming into the hospital and cash is credited because it is going out of the hospital.

1.8.3 Nominal or Fictitious Account

Expenses Income and losses are formal nominal account.

Here the items like Rent, Rates, Taxes, Salaries, Discount and Commission are affected. Income from hospital advances, investment etc. is included.

Example
Paid Rent for building Rs. 50,000/-
The entry will be

Rent Account Rs. 50,000/-	
To Cash	Rs. 50,000/-

Explanation: Rent Account is debited because it is an expense and cash account is credited because it is a real account where credit should be given for an item that gives out.

1.9 ACCOUNTING BOOKS

The objectives of keeping the Accounting books are to enable the hospital manager to ascertain easily and conveniently the following at a glance.

a) The financial position of the hospital

b) The assets and liabilities of the hospital

c) Profit earned or loss incurred for a given period

d) The amount owed by others to the hospital and by the hospital to others

e) The financial requirement of the hospital

In a hospital thousands of transaction may take place every day. They are generally of a repetitive nature like pools purchase etc. They are reflected on vouchers that could be any of the following.

a) The document which serves as evidence of the disbursement or receipt of cash e.g., Cash receipt of the hospital or cash memo for purchase note etc. or an approved invoice from supplier.

b) The form or a voucher to which bills receipts and other evidence of purchases are often attached sharing the authority for payment, the terms for settlement etc.

These vouchers are often listed out in various books, a few of items are briefly described in succeeding paragraphs.

1.9.1 General Ledger

This is the main or basic book of accounting. It contains a record of all transactions for the accounting period analysed under various accounting heads each referring to a separate nature of transaction. The general ledger contains all accounts: Personal, Real and Normal.

1.9.2 Cash Book

In any business all the transactions that affect the cash are entered in a book called the cash book which is kept separate from the other book. When cash book is maintained the cash transactions are not journalised but entered directly in the cash book and then a corresponding entry is posted in the Ledger Receipts and Payments are generally written on the opposite side of the cash book. The number of columns provided for amount depend upon the number of bank accounts being maintained at a regular basis from the receipt books, the daily collection is analysed as under.

a) Cheques and Cash

b) Nature of Receipts such as patient bills, donations, deposits, grants etc.

In the main cash book individual entries are made for each cheque times. Summary totals are posted in respect of cash receipts.

Let us prepare simple cash book.

Example

01-04-99	Cash in hand	Rs.	1,00,000
02-04-99	Paid rent	Rs.	1,000
03-04-99	Purchased medicine for cash	Rs.	1,000
10-04-99	Car sold scrap for cash	Rs.	800
12-04-99	Received cash from patient A	Rs.	900
14-04-99	Purchased stationery	Rs.	750
20-04-99	Paid to daily wager	Rs.	50
24-04-99	Paid maintenance	Rs.	550
29-04-99	Paid electricity charges	Rs.	1,050
30-04-99	Paid salaries	Rs.	50,000

Cash Book

Receipts				Expenditure			
Date	**Receipt**	**Folio**	**Amount Rs.**	**Date**	**Payment**	**Folio**	**Amount Rs.**
01-04-99	To Balance B/d		1,00,000	02-04-99	By Rent		1,000
10-04-99	Scrap taken		800	03-04-99	By Purchase		1,000
12-04-99	Patient		900	14-04-99	By Purchase		750
				20-04-99	By Daily wager		50
				24-04-99	By Maintenance		550
				29-04-99	By Electricity charges		1,050
				30-04-99	By Salaries		50,000
					By Balance C/d		**46,300**
	Total		**1,00,700**		**Total**		**1,00,700**

01-05-99 Balance B/d 46,300/-

1.9.3 Petty Cash Book

The popular system of controlling petty cash expenses is through imprest system. Under this system the petty cash is provided as a round sum in cash, turned as a float sufficient to cover the estimated petty cash expenditure from a week or a fortnight. Payments made by the cashier are entered into a petty cash book or register which has several analysis column. At periodic intervals written the cash balance with them is nearly exhausted, he prepares a petty cash voucher analysing the expenditure incurred under various head and the total expenditure incurred is down from the new cashier. This voucher is entered in the main cash book. Petty cash book is in effect a branch of the main cash book in the sense that the balance of small surgical entries are shown by it.

The format generally used for maintenance of petty cash book is as under:

Date	Particular	Cash Book Folio	Amount Received	Rate	Particular	Voucher Total	Petty Cash

1.9.4 Subsidiary Book

Entries are not made directly into the General Ledger. Every entry in the Ledger should be based on an originating entry in a subsidiary book. The purpose of subsidiary book is to record the transactions as they occur and then to make the posting therefrom to the ledger. They are a number of subsidiary books. These are briefly discussed below:

a) **Purchase Book**

In the purchase book only credit purchase are recorded and cash purchase are excluded. The monthly total is posted to the ledger under head purchaser A/c. The invoice number as given by the supplier is recorded in the purchase book.

Format of Purchase Book

Date	Particular	Invoice No.	LF	Amount

Example

01 Apr. 99	Purchased medicines from Chugh Brothers	Rs. 7,000
10 Apr. 99	Purchased Stationery from Murthy Brothers	Rs. 8,000
15 Apr. 99	Purchased Surgical Glasses from Delhi Surgical	Rs. 10,000
30 Apr. 99	Brought Stationery from Sahu by cash	Rs. 600

Purchase Book

Date	Particular	Invoice No.	LF	Amount
April 01	Chugh Brothers			Rs. 7000.00
April 10	Murthy Brothers			Rs. 8000.00
April 15	Delhi Surgical			Rs. 10,000.00
				Rs. 25,000.00

It is important to note here that the stationery purchased from Sahu by cash is not included in purchased Book can you tell why?

b) **Sale Book (Income System)**

Income Register maintained by hospital are more in the nature of statistical record rather than an Accounting book which demands considerable accuracy. The Income Register provides for analysis of Income by department without any additional clerical effort. The patient bills are entered serially. Some of them are paid in cash some after the bills are raised (almost simultaneously) and some later. They are posted to the relevant parties' accounts in the patient ledger once entries are made. Changes, therefore, made through using of credit/ debit note rather than by altering figures in original books. That is so because only credit sale entries are recorded in the sales book, but in the hospital context there are very few entries of credit sales.

c) **Purchase Return Book**

Here the goods returned to the suppliers are entered. A debit note stating the details prepared are intimated to the suppliers.

d) The other subsidiary books like cash book and petty cash books have already been discussed earlier.

e) General Journal to record transaction not falling in out of the above categories like depreciation charges entries. After having discussed, the principles of double entry and after being acquainted with the various Accounting Books, you must briefly acquaint yourselves with journalising the various transactions. Since journal is the primary step in the Accounting principle.

Example

Let us journalise the following transaction

01.01.99	Commenced a nursing home with cash	Rs. 10,00,000/-
15.03.99	Deposits made in State Bank	Rs. 5,00,000/-

Journal

Date	Particular		LF	Debit	Credit
01.01.99	Cash Account	Dr		10,00,000	
	To Capital				10,00,000
	(Being the cash introduced in hospital)				
15.03.99	Credit Account	Dr		5,00,000	
	To Cash				5,00,000
	(Being the amount deposited in Bank)				

Activity 3

1) Briefly discuss the various types of Accounts.

2) Enumerate the various Accounting books and briefly discuss how they are maintained in your hospital.

1.10 LET US SUM UP

In this unit you have learnt about the concepts of accounting. The foregoing concepts and conventions have been developed primarily for use by profit making enterprises. These guidelines, however are equally applicable to hospitals and hospital accounting. Hospitals though differing in orientation from commercial enterprises are still a form of business. Therefore, the principles of sound business management as mentioned in this unit are just as applicable to hospitals as to private enterprises. The non profit operating philosophy of most hospital should neither constitute an excuse nor be used as a justification for irresponsible management or accounting practices. Hospital accounting practices should thus be based upon the above rules and conventions.

Accounting is the language of business and the process of Accounting involves data creation, collection, evaluation and data reporting. There are several concepts and conventions of Accounting which hospital management understand as the building of any hospital Accounting system. The entity concepts makes a distinction between the business and the owner and the ongoing concern of continuity concepts. You have also learnt about the cost evaluation concept, and need for recording the costs of assets at the price incurred to acquire it, and the double entry concept. You have also learnt that on the logic of the accrual concept the matching concept evolved to match the related items of revenue and expenditure. Apart from the accounting concepts there are certain accounting conventions like reliability, materiality, consistency, conservation which a manager should be familiar with to enable him to understand the basics of accounting practices. There are basically three types of accounts viz. Personal, Real and Nominal Accounts. The personal accounts relate to individual or organisational account, real account relates to various aspects of organisational assets and the nominal account relates to income, expenses and losses.

Subsequently you learnt that there are a variety of Accounting books which are required to be maintained in any organisation including the hospital. The General Ledger is the main or the basic book of accounting in which a record of all transactions for the accounting are recorded. The general ledger is supported by various subordinate books like the cash book, petty cash book, the purchase and sale book, the purchase return book and the general journal.

1.11 SELF ASSESSMENT QUESTIONS

1) "An understanding of these is critical to the knowledgeable use of financial data". What does the word 'these' in this statement implies?
2) Define Accounting? Enumerate the steps involved in the process of Accounting.
3) Briefly state the objectives of financial reporting.
4) Enumerate the basic Accounting Principles.
5) Match the following

Column 'A'	Column 'B'
a) Entity concept	i) Comparing expenses against related revenue
b) Going concern concept	ii) Simultaneous recording of debit and credit entries
c) Cost valuation	iii) Make clear distinction between the hospital and owner
d) Double Entry	
e) Accrual	
f) Matching	

6) Match the Following:

Column A	Column B
a) Personal Account	i) Release to Assets Account
b) Real Account	ii) Release to personal and organisations that are distinct legal entities

c) Normal Account
d) Voucher
iii) Entry of disbursement or receipt of cash
iv) Release to Income and Expenses

7) State True or False:

a) Cash book is the basic book of Accounting

b) In purchase book only cash purchases are recorded

c) Petty cash book is a subsidiary of the main cash book

d) The Govt. returns to applicants are recorded in the purchase return book

e) Vouchering is not a pre-requisites for any transaction to be recorded in the general ledger.

f) All transactions for the accounting period are recorded in the General Ledger.

g) General Journal and General Ledger are the same accounting book.

UNIT 2 UNDERSTANDING COST AND THEIR BEHAVIOUR

Structure

2.0 OBJECTIVES

After reading this unit you should be able to:

- classify costs and their elements;
- define cost accounting; and
- describe the various cost accounting techniques and their applications.

2.1 INTRODUCTION

A hospital is a complex task oriented socio-economic system whose major objective is personalised care and professional treatment to individual patients and ultimately providing high quality service to the community at an optimum cost.

Developing countries have invested heavily on health in recent decades. They have constructed hospitals and buildings and purchased equipment to run them and employed

trained doctors, nurses, and other health care professionals and set up new systems to supply drugs, research and information. Over the years the number of hospital beds and health personnel have increased tremendously. Such investments have created new opportunities, but they have also led to various problems. Once built, hospitals are extremely difficult to close. Once trained, physicians create pressure to be employed. In virtually every developing country, facilities, equipment, human resource and drugs are skewed towards the top of the health system pyramid, i.e. the specialised hospitals. Also in our country the principal tertiary teaching hospital in the city consumes a large proportion of the total resources available for health. Hospitals absorb a significant amount of public spending on health in developing countries and various studies document that out of which about 50 - 70 per cent of the hospital budget is contributed towards salaries of health functionaries. A large amount of money is being spent on medical equipment. Efficiency losses from poor selection and maintenance of medical equipment can be very large. Equipment failed prematurely because maintenance budgets were very low. Always there is an advancement of medical knowledge in the fields earlier not known, resulting in the establishment of new disciplines in the hospital which ultimately leads to high cost of medical care.

Increasing demand for health care system in India has in its wake highlighted a number of management problems in its existing health care institutions. Since there is always scarce resource it is required to make the most economic use of the available resources. Hospitals have felt additional financial pressure as a result of international efforts to shift spending towards primary health care and reduce dominance of hospitals' share of public health budget. With rapid changes in economic structure more and more emphasis is being laid on the financial matters of hospitals so that maximum amenities can be provided at minimum cost. In this environment, attention has been focussed in this unit on studying costs, elements of cost, methods of analysing costs of hospitals and understanding how different types of costs behave differently in different situations, and the way they change with the level of activity. This unit will also familiarise you with the concepts of cost accounting and cost volume profit analysis.

2.2 COSTS

In general, people understand costs in terms of monetary prices or the amount of expenditure incurred on goods and services. But economists understand the cost as the sacrifice made in order to obtain a good or a service.

In some cases the expenditure incurred on a good or service may be good indicator of the sacrifice made to obtain the same but there are situations where it is not. For example:

- in some situations resources used do not have monetary value.
- some resources do have monetary value but they cannot be exactly measured.
- some activities may have 'spillover effects'. These can be either positive or negative. Money price may reflect only the positive ones or the benefits for consumers and producers and does not reflect on the existence of benefits to the society.

2.3 ELEMENTS OF COST

There are three broad elements of cost:

2.3.1 Material

It is the substance from which the product is made. It may be raw product or product of output. It can be direct or indirect.

Direct Material

All material which becomes an integral part of the finished product or service and which can be easily assigned to specific physical units is termed as *direct material*. Examples are all materials purchased, produced or requisitioned from stores; primary packing material, etc. In hospitals cost of medicines, operation theatre material, x-ray plates etc. which can be identified when rendering treatment to patients could be *considered* as *direct* material.

Indirect Material

All material which is used for purposes ancillary to the production or service and which

cannot be easily assigned to specific physical units is termed as *indirect material.* Consumable stores, oil and waste, printing and stationery material, etc. are some of the examples of indirect material.

2.3.2 Labour

For conversion of material into finished products or producing service outputs human effort is required. These are called *labour.* Labour can also be direct or indirect.

Direct Labour

Labour, which takes an active and direct part in the production of a particular commodity or in provisioning of a service is called direct labour. In hospitals physicians, nurses etc. can be considered to be direct labour while providing treatment to the patients.

Indirect Labour

Labour employed for the purpose of carrying out activities incidental to the goods produced or services provided is called indirect labour. It cannot be easily traced to specific units of output. Wages of storekeepers, security, management etc. are examples of indirect labour.

2.3.3 Expenses

These may be direct and indirect.

Direct Expenses

These are expenses that are directly, easily and wholly allocated to specific cost centres or cost units. Example is like hiring of some instrument for a particular purpose either diagnostic or therapeutic.

Indirect Expenses

These are expenses that cannot be directly, easily and wholly allocated to costs centres or cost units. Examples of such expenses are rent of building, lighting, insurance etc.

The above elements of costs may be shown by means of Chart 1.

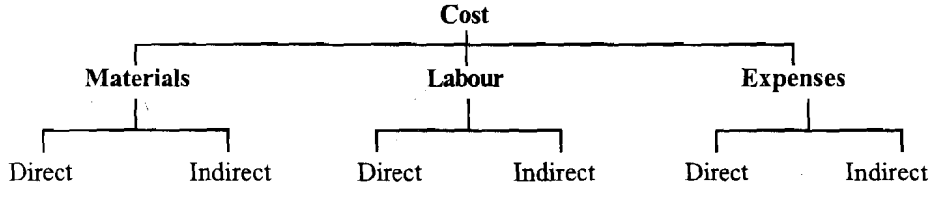

Chart 1: Elements of Cost

Overheads

The term overheads includes indirect material, indirect labour and indirect expenses. Thus all indirect costs are overheads. Overheads may be of three types:

Works or factory overheads— where hospital operations are performed. They are:

- Indirect Material used in the hospital, e.g. lubricants, oil etc.
- Indirect Labour such as gatekeeper-salary of security officers and personnel salary.
- Indirect Expenses such as rent of hospital building, lighting of works departments etc.

Office and administration overheads— where hospital routine and policy matters are decided. They include:

- Indirect Material used in the offices e.g. stationery and rooms/housekeeping material.
- Indirect Labour such as salaries payable of hospital manager, accountant, clerks etc.
- Indirect expense such as office rent, lighting etc.

Selling and distributing overheads: They considered:

- Indirect Material such as printing and stationery material for hospital information system/guiding systems.
- Indirect Labour such as salaries of Public Relation Officers.
- Indirect Expense such as Advertising expenses etc.

Components of Total Cost

Prime cost which consists of Direct Material, Labour and Expenses.

Works or Production costs which is Prime cost plus works or factory overheads. Office costs which consists of work cost plus office and administration overheads. Total cost which comprises office costs plus selling and distribution overheads.

2.4 CLASSIFICATION OF COSTS

Costs can be classified in different ways depending on the purpose for which it is required. But in general costs can be classified broadly into fixed and variable costs, direct and indirect costs, and capital and recurrent costs.

2.4.1 Variable and Fixed Costs

Variable costs are items of costs that vary directly and proportionately with production volume. If the total amount of costs increases as volume increases, the item is a variable cost. The percentage of cost increase or decrease that results in proportionate to the percentage change in the volume of production or the services provided.

Fixed costs do not vary with change in production volume. Fixed cost, in aggregate, will remain the same even though increases or decreases of production volume may occur. Building depreciation, taxes, salaries, and overheads (water, electricity, etc.) are examples of expenses that behave in a fixed manner.

Fixed costs can be further divided into:

Committed fixed costs are those costs that arise from the possession of building, equipment. For example, once a hospital building is constructed nothing can be done to reduce depreciation, insurance, salaries of staff, etc.

Discretionary fixed costs are related to specific time periods. They directly reflect management policies and are not related to output. Examples are costs incurred on research and development, advertising, etc. These can be completely eliminated.

Semivariable costs are costs that vary with changes in volume, but the increase or decrease in the percentage of change in cost is not the same as the increase or decrease in production capacity or service outputs. The change is, of course, always in the same direction and is normally lower than the percentage change in production or services provided. They have both fixed and variable elements. These are costs such as catering, laundry, linen, repair and maintenance, etc. They tend to be constant for each patient day but there may be some variation depending on the diagnosis and patient characteristics.

2.4.2 Direct and Indirect Costs

Direct costs are those costs that can be identified entirely to a particular department or a product or a service.

Indirect costs cannot be entirely identified to a particular department, product or service. Cost of administration is an example of indirect cost. The salary of departmental head is an example of direct cost. However, within the department if there are a number of services to be delivered, then for each service, his salary will be indirect cost.

It is important to note that direct costs are controllable costs whereas indirect costs are not controllable.

2.4.3 Capital and Recurrent Costs

Capital costs are usually defined as costs for items with a life of more than one year. Typical examples include costs of construction of building, purchase of equipment, basic manpower training, etc.

Recurrent Costs are those costs that are necessarily incurred each year. These include items such as salaries and wages, drugs and supplies, water and electricity, in-service training, etc.

2.5 SOME OTHER CONCEPTS OF COSTS

2.5.1 Product Costs and Period Costs

Costs which become part of the cost of product rather than an expense of the period in which they are incurred are called as product costs. Such costs are treated as assets until the goods they are assigned to are sold. They may be fixed or variable. These are cost of raw materials and direct wages, depreciation on equipment, etc.

Costs that are not associated with production are called period costs. They are treated as an expense of the period in which they are incurred. They can also be fixed or variable. These are costs of general administration, depreciation on office facilities, etc.

2.5.2 Decision-making Costs and Accounting Costs

Decision-making costs are special purpose costs that are applicable only in the situation in which they are incurred. They need not be included in routine financial accounts.

Accounting costs are compiled primarily for financial statements. They are basically historical costs and show what has happened under an existing set of costs.

2.5.3 Shut Down and Sunk Costs

An organisation rendering service may have to suspend a particular operation for a period on account of some temporary difficulties, e.g., shortage of raw material, repair of an Operation Theatre, etc. During this period though no work is done yet certain fixed costs, such as, rent and insurance of building, depreciation, maintenance, etc., for the entire activity or service will have to be incurred. These costs are called shut down costs.

Sunk costs are historical or past costs. These are costs that are created by a decision made in the past, which cannot be changed, by any decision made in future. These are irrelevant for decision-making. Investments in plant and machinery, building, etc. are same prominent examples of sunk costs.

2.5.4 Imputed or Hypothetical Costs

These are costs that do not involve any cash outlay. They are not included in cost accounts but are important for taking into consideration while making management decisions. For example, interest on capital is ignored in cost accounts though it is considered in financial accounts.

2.5.5 Differential, Incremental and Decremental Costs

The difference in total costs between two alternatives is termed as differential cost. In case the choice of an alternative results in increase in total cost, such increased costs are known as incremental costs. In case the choice results in decrease in total costs, such decreased costs are termed as decremental costs.

2.5.6 Opportunity Costs

Opportunity cost represents the benefits foregone by not choosing the second best alternative in favour of the best one. When we decide to follow one alternative, we are also deciding not to follow another. As a result, all the benefits that would have accrued are given up. To the extent they can be quantified or measured, they are opportunity costs of the decision. Assume that a company owns a building; it would be either used for business purposes or be rented to others. If a decision is taken to use the building the amount of rent foregone constitutes the opportunity cost. The lost rent is an opportunity cost only if there are potential tenants willing to hire the building. Since they are hypothetical/theoretical costs, they are not entered in accounting records. But the cost of the second best alternative must be taken into account before taking a decision.

Activity 1

Classify each of the following as Direct or Indirect Cost (D or I) *Direct/Indirect.*

a) Cost of medicines provided for patient care

b) Cost of x-Ray films while treating patients

c) Cost of lab reagents while assessing cost of patient care

d) Raw material for food served in a hospital

e) Salary of medical stores keeper

f) Salary of a doctor

g) Oil used for lubricating machine

h) Cost of air conditioning plant

i) Cost of training programmes

j) Salary of nursing officers

(Answers: (a), (f), and (j) are direct: cost and others are indirect cost)

2.6 COST ACCOUNTING

Cost accounting is a branch of accounting information system that records, measures and reports information about costs. The primary purpose of cost accounting is cost ascertainment and its use in decision-making and performance evaluation. A cost accounting system provides data for both financial accounting and management accounting. As a major financial information system for management analysis and decision-making, the hospital's cost accounting system provides:

1) Internal reporting to managers for use in planning and controlling routine operations.

2) Internal reporting to managers for use in making non-routine decisions and formulating policies and plans for future activities.

3) Information useful for external reporting to stockholders, government agencies and creditors.

The initial step in the implementation of cost accounting system is to assemble revenues, costs and standard performance criteria. Three basic methods of assembling cost accounting data are given below:

a) **Responsibility costing** traces the costs of the individual organisational units called responsibility centres. Estimates of future responsibility centre costs are initially established during the hospital's budgeting process. A historical accounting of the actual costs incurred in a responsibility centre is used during the hospital's fiscal year to measure the performance of the responsibility centre and to analyze deviations from the approved budget. Responsibility centre reports are extremely useful for organisational control and objective settings because they present both the goals for specific production functions and centre's performance relative to these goals.

b) **Full costing** of goods manufactured or services provided sums the direct costs related to the production process plus an allocated share of the indirect costs that the organisation incurs as overhead.

c) **Differential costing** estimates how the costs and revenues in one situation will differ in alternative situations. It, therefore, focuses management's analysis on the incremental costs that come with adding or deleting products or programmes.

There are various advantages and limitations of cost accounting system. An efficient cost accounting system can have the following advantages:

a) Identification of costly activities provides an opportunity to the management for considering alternatives or modifications.

b) Determination of standards and allow comparisons.

c) Detailed investigations of costs in health care further lead to estimation of benefits derived from the resources spent.

d) Reductions in cost of patient care without compromising quality.

e) A comprehensive financial management plan of an organisation covering financial planning, budgeting and resource allocation can be developed.

Limitations of a cost accounting system could be:

a) A costing system does not itself make an organisation more efficient, but provides information to the management to take decisions.

b) The information supplied may refer to the costs incurred in the past i.e. historical costs. Care should be taken while planning future costs because they may not be the same.

c) The problems of case mix because medical specialities are not homogenous and costs vary greatly between different patients, specific groups and specialities.

d) Incompletely recorded information has its own limitations.

2.7 COST OUTPUT RELATIONSHIP

In studying the relationship that exists between cost and output it is useful to separate it into two components. The first looks at the physical relationship that exists between inputs and outputs (production) and the second looks at the costs attached to it. To understand it better it is important to know three measures of cost:

1) *Total cost* (TC) is a measure of all the costs entailed in producing a given level of output. It is derived by summing up all the costs incurred during production. An example would be the cost of providing an immunisation service.

2) *Average cost* (AC) is a measure of the total costs of production associated with each unit of output. Average costs indicate the resource requirement for each unit of output and are calculated by dividing total costs (TC) by the number of units of output (Q) (AC=TC/Q). An example would be the cost per immunisation provided.

3) *Marginal cost* (MC) is a measure of the resources associated with a small incremental change in output. In fact, it is a measure of the change in costs associated with increasing or decreasing output by one, and is derived by calculating the change in total costs for that one unit. An example would be the incremental cost of adding an additional vaccine to the existing service, or of extending the service to an additional village.

Suppose, production consists of using two inputs to produce some good or service. As one input varies, three alternatives are possible within the quantitative relationship between inputs and outputs. Output can rise proportionately faster than the input, proportionately slower, or at the same rate.

The second part of the relationship between output and cost is the relationship between the resource inputs and price. Although it is assumed that the price of resources will remain constant as output rises, it is possible that they will not. They may fall if it is possible to negotiate discounts through bulk purchases; or they may rise if more needs to be paid to attract scarce resources as the demand for them increases.

2.8 COST ANALYSIS

Cost analysis is the process of rearranging data or information in the existing accounts to obtain the costs of the services rendered by the hospital or any health set-up. There are five prerequisites for cost analysis.

1) There should be an organisation chart and a chart of accounts relating to it.

2) There should be an identification of all cost centres as either general service cost centres or as final cost centres to which all costs are ultimately assigned.

3) There should be an accurate accounting system.

4) There should be a comprehensive information system capable of collecting non-financial data by cost centre and by the total hospital, providing: a) the basis for distribution of costs from general service centres to final cost centres; and b) the basis for calculating unit cost by final cost centres.

5) A methodology for cost analysis should be chosen that is most practicable for the situation.

There are two general approaches of cost analysis in health sector.

1) The Direct Accounting Approach

It makes use of accounting information and reanalysis of health or hospital service records to examine costs and performance. It focuses on the costs directly associated with a particular activity. It attempts to calculate the costs of the resources that are actually used in an activity or those that are consumed by a particular patient. In practice this often proves

difficult because it is difficult to identify the resources used in many activities and to calculate what proportion of the costs of the shared items or facilities should be apportioned to individual activities. Examples of the direct accounting approach include:

a) *Activity costing* – detailed costing of the activities of different cost centres, such as whole hospitals, speciality departments, or health centres

b) *Disease costing* – attempts to identify the cost incurred in treating particular diseases, or particular types of patient, or even in carrying out certain types of procedures.

2) **The Statistical Approach**

This approach focuses on the costs associated with types of activity or types of patient and not on the costs associated with individual activities or individual patients. Rather than addressing the issue of how much something costs and how these costs are incurred, the statistical approach addresses the issues of why costs differ, and by how much. The accounting approach can be applied to a single hospital and involves a labour intensive, detailed examination of hospital accounts, staffing pattern and admissions. Less detailed data are needed in the statistical approach, but it requires observations of costs and service use for many years.

The statistical approach can be illustrated by the following example. In studying, say, the costs associated with providing hospital care, it is very likely that there will be wide variations in cost between different hospitals. Why should this be the case? Some hospitals may be more effective or more efficient than others, or there may be other reasons why these costs vary. Hospitals may differ with respect to:

- size (number of beds)
- number of cases treated in a given time period
- case-mix
- case-severity
- quality of care
- type of treatments offered
- teaching or research activities
- age and/or location of hospital facilities
- occupancy levels
- manpower availability
- length of stay

One or more of these factors may account for differences in measured costs between hospitals.

2.9 METHODS OF COST ANALYSIS

There are several methods of cost analysis that are commonly used in direct accounting approach. These are as follows:

1) Direct apportionment

2) The step-down method

3) Double apportionment

4) Algebraic or multiple apportionment

1) **Direct Apportionment**

Allotting the cost incurred by non-revenue producing departments to revenue departments by direct apportionment can be done by any one of the several methods. The simplest and least logical way is for administration to determine arbitrarily the percentage of the non-revenue connected expense each revenue centre has to bear. Other yardsticks can be based on the percentage each revenue department represents of the total square footage of the hospital's building or of the number of employees, payroll, pounds of laundry, patient days or number of purchase requisitions.

Direct apportionment, though administratively and clearly simple is an inappropriate cost finding methodology because, it a) ignores the exchange of services between non-revenue

producing departments, and b) does not compensate for the different demands for services by revenue departments on non-revenue departments.

2) **The Step-down Method**

The step-down method is more advanced cost finding technique than direct allocation, for it involves the distribution of costs of non-revenue producing departments to other non-revenue departments and, in turn, finally to revenue departments. The term step-down is used because of the format in which distribution of non-revenue department costs are made. The costs of non-revenue department serving the most departments (both revenue and non-revenue) are distributed first; the non-revenue department serving the second largest number of departments is distributed next; the one serving the third largest number next, and so on.

It should be noted that the step-down method has been criticized as not allowing fully for interdepartmental charges between the different non-revenue departments.

3) **Double Apportionment**

Double apportionment or double distribution was designed to correct one of the major weaknesses of the step-down method. In double apportionment two separate cost distributions are used. In the first distribution all direct and indirect costs of all departments are distributed to the various cost centres according to the agreed upon basis of allocation. After the first distribution is completed, the costs that have been allocated to the non-revenue departments are then redistributed to the revenue producing departments using the same basis of allocation as before (square footage, etc.).

Basically double distribution is two distribution of costs to reflect as accurately as possible the interchange of services between non-revenue departments before costs are finally allotted to the revenue producing departments.

4) **Multiple Apportionment (Algebraic Method)**

Multiple distributions are made of expenses between non-revenue departments and then, finally to revenue departments in an attempt to refine the cost analysis to the greatest possible degree of exactness. Although 10 to 12 distributions are made in some methods, it is generally agreed that after 4 distributions there is little change in the ultimate cost figure. These distributions can be done manually but from a practical standpoint double distribution remains the most feasible manual method.

This type of cost analysis is the most accurate method yet devised, but it is beyond the capabilities of the average hospital accountant. On the basis of accuracy alone, the order of preference of cost analysis would be:

1) multiple apportionment,
2) double apportionment,
3) step-down, and
4) direct apportionment.

From a practical standpoint of time and cost of the analysis, however, it would be better to consider the selection of manual method as:

1) Double apportionment, and
2) Step-down method.

Cost Effectiveness Analysis

It is a form of economic evaluation where the costs are expressed in monetary terms but some of the effects are expressed in physical units (e.g. life years gained, cases detected). It is usually used to compare different ways of achieving the same objective (e.g. saving lives) and assumes the objective that is worth achieving.

Cost effectiveness analysis involves organising information so that the costs of alternatives and their effectiveness in meeting a given objective can be compared systematically. It involves three distinct sub-processes: (a) Developing comprehensive costing details and analysis of cost of each alternative; (b) An analysis of effectiveness of each alternatives; and (c) An analysis of the relationship between the costs and effectiveness of each

Cost Benefit Analysis

Cost benefit analysis is an economic technique applicable to health planning, health management and evaluation. It is a form of economic evaluation where all the costs and benefits are expressed in money terms. In principle, this form of analysis enables one to assess whether a particular objective is worth achieving. However, estimation difficulties often reduce cost-benefit analysis to a consideration of those costs and benefits that are easy to express in money terms. It determines which scheme or combination of schemes will contribute most to the achievement at a given investment, or the magnitude of benefits that can result from schemes requiring the minimum investment.

Cost benefit analysis attempts to value all socially relevant outcomes in monetary terms. In day-to-day use, cost benefit analysis is primarily utilised to justify if a particular health services programme is relatively more beneficial. Although it is difficult to express all possible health and social benefits in financial terms, it helps in taking technical decisions backed by economic logic.

Activity 2

1) What is Cost Accountancy?
2) List the Advantages of Cost Accountancy.

2.10 COST BEHAVIOUR IN RELATION TO HOSPITAL OUTPUT

Whatever method of costing is used, the unit of analysis (such as patient days, admissions or outpatient visits) and consideration of both average and marginal costs are important, because the use of any single output may produce misleading results. Recurrent hospital inpatient costs are considered to have three components:

a) **Overhead costs:** These costs remain essentially constant regardless of whether a bed is occupied. Typically, they include items such as heating and maintenance, but for public hospitals in developing countries, personnel may be a large component of overhead costs, because it may not be possible for staff to be reduced in the short run during periods of low occupancy. The magnitude of overhead costs is related to the hospital size.

b) **Hotel costs:** These are costs, such as catering, laundry, and linen that are incurred for each patient day in the hospital. They tend to be constant for each day of a patient day, though there will some variations related to the diagnosis and patient characteristics.

c) **Treatment costs:** These are case-dependent costs associated with a particular diagnostic, therapeutic and other treatment services provided to the patient. These costs tend to peak in the first few days of a patient stay, when, for example, there might be an operation, and then diminish thereafter. The actual pattern of treatment costs in any hospital will vary depending on the clinical management of the hospital.

The hospital in which the length of stay of patients is longer, other things equal, would tend to have a lower average cost per day because the treatment costs for the additional days would likely be far below the average for the case. The extra days stay in the hospital would probably contribute little to the improvement of the patient's condition, and thus the lower average cost would actually mask inefficient hospital performance.

Assuming that the treatment cost profile is similar, high occupancy rates tend to result in lower average costs per patient day because overhead costs are spread over beds that are actually filled. If high occupancy results from relatively few admissions but very long stay, however hotel costs will be high in relation to the number of patients and average cost per day per admission will be high. The expected marginal cost per bed per day will be low because the treatment costs at the end of a long hospital stay tend to be minimal. Alternatively, if the bed turnover rate is high, average cost per admission is apt to be lower because hotel costs are spread over a large number of patients, whereas the marginal cost per day will be relatively high. Increasing the bed occupancy rate through a greater number of admissions per day rather than longer stays will allow more patients to be served and thus improve hospital productivity.

Low occupancy rates are a commonly observed feature in many developing countries.

85-90 per cent occupancy at which they operate most efficiently. In the short run, a relatively small percentage of hospital costs can be varied; most costs are fixed and determined by the scale of the facility and the personnel establishment (the overhead costs). Personnel costs, which make up the bulk of fixed cost, represent a range of about 35-75 per cent of total recurrent costs. The effect of low occupancy is to spread the cost of personnel and other fixed inputs over a smaller number of service units and raise the average cost of services. Even if hospital inputs are being used with technical efficiency low occupancy implies economic inefficiency.

A high bed occupancy rate does not necessarily indicate better hospital performance. Indeed, bed occupancy rates can be too high, in the sense that the volume of services is above the design level of the hospital. The implications of high occupancy for average costs and hospital efficiency are ambiguous without information on the other service indicators. The reason for this is that a high occupancy rate may reflect a relatively efficient situation as many patients with modest lengths of stay are served (i.e. the hospital has a high bed turnover rate), or an inefficient situation, as when high proportion of filled beds largely results from long length of stay. The latter situation is signaled by a low average cost per day but a relatively high average cost per admission.

There are other reasons why a high occupancy rate does not by itself imply a relatively efficient hospital. For example, with high occupancy rates, scheduling of individual service activities, maintenance, and management becomes more difficult and are more costly. The measured average costs from accounting based studies do not provide sufficient evidence to support or reject the hypothesis that average costs are regularly lower for hospitals with extraordinarily high occupancy rates. More likely is that the quality of services is compromised as staff attention, laboratory and ancillary services are divided among a greater number of admissions that exceeds the hospital's design capacity. In addition, very high occupancy rates may reflect overcrowding, which can facilitate the spread of hospital acquired infection.

2.11 COST VOLUME PROFIT ANALYSIS

Cost volume profit analysis is a valuable tool of profit planning. It provides information about the following:

1) Cost behaviour in relation to volume of production.
2) Break even point in relation to volume of production or sales.
3) Amount of profit for a projected sales volume.
4) Quantity of production and sales for a target profit level.

Cost volume profit analysis is defined as a managerial tool showing the relationship between various components of profit planning, viz. cost (both fixed and variable), selling price and volume of activity.

It is useful to the management in the following situations:

1) It helps in forecasting the profit fairly accurately.
2) It can ascertain the costs, sales and profits at different levels of activity so it is easier to set up flexible budgets.
3) It helps in performance evaluation for the purpose of management control.
4) It helps in formulating price policy.
5) It helps in determining the amount of overhead cost to be charged at various levels of operations.

2.12 BREAK EVEN ANALYSIS

Cost volume profit analysis is also popularly known as break even analysis. The difference between the two is very narrow. Cost volume profit analysis includes the entire gamut of profit planning while break even analysis is a widely used technique to study this process. *Break even point* is the point that breaks the total cost and the selling price evenly to show the level of output or sales at which there shall be neither profit nor loss. In other words it is the point where revenue and expenditure are same. If production is increased beyond this

level then there shall be profit and if it is decreased then loss shall be suffered.

Break even point = Fixed cost divided by selling price per unit minus variable cost per unit.

Costing of various services and departmental accounting are the bases on which the structure of break even analysis can be made. Cost centre is the fulcrum for such analysis. Let us take the example of radiology department as a cost centre. With reference to the number of investigations done in the radiology department income is known. On the basis of departmental accounting the revenue and expenditure of the radiology department can be ascertained. To find out whether the department of radiology is financially viable, work out the fixed and variable cost of the cost centre. By dividing the total cost by the number of investigations done during a specific period we can found out the cost of an investigation i.e. cost per unit. The selling price of an investigation is also known. From the above equation it is possible to know the exact point from where one can make profit. Let us assume the figures as: Fixed costs = Rs. 32,00,000; variable costs per unit = Rs. 200 and the selling price = Rs.1000. Break even point = 32,00,000 divided by 1000 minus 200 = 4,000 units. That means when number of investigations reach 4,000 units (tests) the break even point is reached. In other words, if the total number of investigations increase beyond 4,000 then there shall be profit and if it decreases beyond 4,000 then there shall be loss.

It will be easier to understand from the table. The bold row is the break even point.

No. of units Rs.	Fixed cost Rs.	Variable cost Rs.	Total cost Rs.	Revenue cost Rs.
1,000	32,00,000	2,00,000	34,00,000	10,00,000
2,000	32,00,000	4,00,000	36,00,000	20,00,000
3,000	32,00,000	6,00,000	38,00,000	30,00,000
4,000	**32,00,000**	**8,00,000**	**40,00,000**	**40,00,000**
5,000	32,00,000	10,00,000	42,00,000	50,00,000

2.13 LET US SUM UP

For providing high quality services in the hospital at an optimum cost it has become essential to understand the concepts of costs and the way they behave in different situations. Cost is the sacrifice made in order to obtain a good or service. There are mainly three elements of costs, viz., material, labour and expenses. All indirect costs are called overheads. Costs can be classified into variable and fixed costs, direct and indirect costs, and capital and recurrent costs. Each classification has its own significance in management decisions.

Cost accounting is a branch of accounting information system that records, measures and reports information about costs. Relationship between costs and output can be understood through total cost, average cost, and marginal cost concepts. Cost analysis is basically a technique of cost accounting. There are various methods of cost analysis. From a practical standpoint two methods of cost analysis are commonly used i.e., double apportionment and step-down method.

Cost volume profit analysis is valuable tool for profit planning. It forecasts the level of profit quite accurately. It is also popularly known as break even analysis. In fact, cost volume profit analysis includes the entire process of profit planning whereas break even analysis is a widely used technique to study this process.

2.14 KEY WORDS

Accounting : The art of recording, classifying and summarising in a significant manner and in terms of money, transactions that are, at least in part, of a financial character and interpreting the result thereof.

Budget : A formal, written estimate of income and expenditure for a future period, leading to the allocation of funds to budget holders.

Capital : The stock of goods which are man-made and used in production (as opposed to consumption). In accounting conventions, capital goods are usually taken as those with a life of more than one year.

Cost : What has to be given up to achieve something, either:

a) the value of opportunities which are forgone in order to achieve something (the economic definition); or

b) the total money expenditure required to achieve something (the accounting definition).

Cost benefit analysis : A form of economic evaluation where all the costs and benefits are expressed in money terms. In principle, this form of analysis enables one to assess whether a particular objective is worth achieving.

Cost effective analysis : A form of economic evaluation where the costs are expressed in money terms but some of the effects are expressed in physical units. It is usually used to compare different ways of achieving the same objective and assumes the objective is worth achieving.

Depreciation : Decrease in value of a capital good because of passage of time, wear and tear, etc. An allowance for depreciation may be included as an operating cost in accounts.

Efficiency : Relates to output per unit cost of the resources employed. Resources are being used efficiently if a given output is produced at minimum cost, or maximum output is produced at a given cost ('operational' efficiency). Economists also use the term in their wider sense of cost-effectiveness and cost-benefit analysis ('allocative' efficiency).

Expenditure : Outlay of money to purchase goods or services.

Fiscal : To do with public expenditure and with raising government revenue, for instance through taxation.

Fixed cost : Costs which do not vary with the level of output in the time period considered (usually one year).

Inputs : Goods and services used in production, such as capital goods (buildings, equipment), labour, raw materials, etc.

Marginal cost : The change in total cost at a given scale of output when a little more or little less output is produced.

Operating cost : The cost of operating an enterprise or service, also called recurrent costs.

Opportunity cost : The benefits to be derived from using resources in their best alternative use. It is therefore a measure of the sacrifice made by using resources in a given programme. When economists use the term 'cost' they mean opportunity cost. This may not be the same as health care expenditure.

Outputs : The end-result of production, that is what is produced.

Recurrent costs : Costs that 'recur' i.e. the costs of running an enterprise, such as salary and raw material costs. Also known as operating costs.

Resources : The inputs that are used to produce and distribute goods and services. They are conventionally classified into land (including natural resources), labour (people) and capital (goods made to produce other goods).

2.15 SELF ASSESSMENT QUESTIONS

1) What is cost?
2) What are the elements of cost?
3) Classify costs and define them.
4) What is opportunity cost?
5) Define cost accounting.
6) What are the various methods of assembling cost accounting data?
7) Define total cost, average cost and marginal cost.
8) Define cost analysis. What are the various pre-requisites of cost analysis?

9) Describe the methods of cost analysis.

10) Define cost-effectiveness analysis and cost-benefit analysis.

11) Define cost volume profit analysis. Enumerate the various uses of cost volume profit analysis.

12) What is break even analysis? What do you understand by 'break even point'. Illustrate with suitable examples.

13) State whether the following statements are true or false.

a) Opportunity cost is cost of sacrificed alternative.

b) Sunk costs are very important for decision making.

c) An item of cost which is direct for providing lab services may be indirect for patient care.

d) Fixed cost per unit remains fixed.

e) Variable cost does not vary with change in output.

14) Fill in the blanks:

a) ..... is a measure of all costs involved in providing a given level of service.

b) ..... is a measure of resources associated with a small incremental change in output.

c) ..... traces the costs of the individual organisational units called responsibility centre.

d) ..... estimates now the costs and revenues in one situation will differ is alternative situations.

e) ..... is the process of rearranging data or information is the existing accounts to obtain the costs of the services rendered by the hospital.

15) State whether each of the following statements is true or false.

i) Cost Volume Profit relationships aid is planning (T/F)

ii) In CVP analysis cost is an irrelevant variable (T/F)

iii) Lower selling prices will push up the break even point if volume remains constant (T/F)

iv) To be able to 'control' costs must be segregated into fixed and variable (T/F)

v) The higher the break even point the lower the fixed costs (T/F)

vi) Semivariable costs connot be separated into fixed and variable elements (T/F)

vii) Where total costs are Rs. 60,000, fixed costs are Rs. 30,000 and sales are Rs. 1,00,000 the break even point in rupees would be:

a) Rs. 50,450

b) Rs. 42,857

c) Rs. 45,332

d) Rs. 60,000

e) None of the above.

2.16 ANSWERS TO SELF ASSESSMENT QUESTIONS

For answers to SAQs 1 to 12, refer respective sections/sub-sections from this unit.

13) a) T b) F c) T d) F e) F

14) a) Total Costs

b) Marginal Costs

c) Responsibility Costing

d) Differential Costing

e) Cost Analysis

15) i) T ii) F iii) T iv) T v) F vi) F

vii) b) BEP in Rs = $\frac{\text{Fixed Costs} \times \text{Sales}}{\text{Sales} - \text{Variable Costs}}$

$= \frac{30,000 \times 1,00,000}{1,00,000 - 30,000} = \text{Rs. } 42,857$

UNIT 3 BUDGETING

Structure

3.0 OBJECTIVES

After going through this unit you should be able to:

- explain the concept and role of budgeting in managing hospitals and health care institutions;
- develop an appreciation of the budgetary procedures and administration and how to apply them to the existing health care set-up; and
- implement various budgetary techniques and approaches.

3.1 INTRODUCTION

The process of managing any hospital or health care institution to achieve its objectives necessitates a systematic approach to financial planning. For financial planning reviewing the past information alone is not sufficient since as hospital and health care administrator's job involves not only predicting but also shaping the future of their organisation. This involves proper planning of all the activities of the hospital or the health care set-up. A budget is an important tool for financial planning and control. It is an integral part of management which seeks to regulate the flow of its funds to the desired ends, since inspite of a good financial plan, the desired results may not be forthcoming if there is no effective control to ensure its implementation. The budget thus acts as a set of yardsticks or guidelines for use in controlling the internal operations of the hospital or a health care institution. The management through a budget can evaluate the performance of every department or level of utilisation of the hospital or health care set-up. The discrepancy between plan performance and actual performance can be highlighted through budgets. The organisation may also have to change the course of its operations in a particular area or revise its plans keeping in view of the changing conditions or environment. It, therefore, will be useful for you to understand the complete budgeting process and what actually a budget is?

UNIT 3 BUDGETING

Structure

3.0 OBJECTIVES

After going through this unit you should be able to:

- explain the concept and role of budgeting in managing hospitals and health care institutions;
- develop an appreciation of the budgetary procedures and administration and how to apply them to the existing health care set-up; and
- implement various budgetary techniques and approaches.

3.1 INTRODUCTION

The process of managing any hospital or health care institution to achieve its objectives necessitates a systematic approach to financial planning. For financial planning reviewing the past information alone is not sufficient since as hospital and health care administrator's job involves not only predicting but also shaping the future of their organisation. This involves proper planning of all the activities of the hospital or the health care set-up. A budget is an important tool for financial planning and control. It is an integral part of management which seeks to regulate the flow of its funds to the desired ends, since inspite of a good financial plan, the desired results may not be forthcoming if there is no effective control to ensure its implementation. The budget thus acts as a set of yardsticks or guidelines for use in controlling the internal operations of the hospital or a health care institution. The management through a budget can evaluate the performance of every department or level of utilisation of the hospital or health care set-up. The discrepancy between plan performance and actual performance can be highlighted through budgets. The organisation may also have to change the course of its operations in a particular area or revise its plans keeping in view of the changing conditions or environment. It, therefore, will be useful for you to understand the complete budgeting process and what actually a budget is?

3.2 WHAT IS A BUDGET

Historically the word "budget" referred to a leather pouch or the leather bag in which the chancellor of exchequer in Britain carried to parliament the statement of Government's needs and its resources. Today, in Government, the budget refers to the statement of anticipated receipts and payments of the Government during a year and forms the basis of appropriations by the legislature. The budget of a commercial organisation has a wide connotation and we can generally equate budget with prompt planning in such organisations.

Hospital administrators are generally familiar with budgeting as an activity or exercise undertaken by their financial managers or accountants in the nature of a forecast of the income or expenses of their organisation for the ensuing financial year. In public sector or government owned hospitals, the primary purpose of the budget is to secure finances or grants from appropriate competent authorities. It is also used as an authorisation to incur expenditure on specified items or activities upto the amounts as indicated against each of them. After having understood what a budget is and what it means to different set ups we must now define a budget and identify its main characteristics.

3.2.1 Budget Defined

Simply defined, a budget is a statement of plans expressed in quantitative, usually monetary terms, covering a specific period of time, usually one year. It can also be described as a financial and/or quantitative statement, prepared and approved prior to a defined period of time of the policy to be pursued during that period for the purpose of attaining that objective.

3.2.2 Main Characteristics of a Budget

a) It is prepared in advance and is derived from the long-term strategy of the hospital or health care organisation.

b) It focuses on the future i.e., it is future oriented.

c) It is expressed in quantitative forms, physical or monetary unit or both.

3.2.3 How Does a Budget Help Us

A properly planned and prepared budget helps us in the following ways :

a) It brings about the efficiency and improvement in the working of the health care organisations.

b) It is a way of communicating the plans to various units or subunits of the health care organisation by establishing the divisional, departmental, unit or sectional budgets, exact responsibilities for incurring expenditures or generating revenue are assigned. It thus minimises the possibilities of buck passing if budget figures are not met.

c) It is a way of motivating various heads of health care organisations, the departmental or unit heads to achieve the goals set for them.

d) It serves as a benchmark for controlling ongoing operations.

e) It helps in developing team spirit where participation in budgeting is encouraged.

f) It helps in reducing wastages and losses by revealing them in time for corrective actions.

g) It serves as a basis for evaluating the performance of the managers.

3.3 CLASSIFICATION OF BUDGETS

Budgets can be classified in different categories on the basis of time, function or flexibility :

3.3.1 Time Based Budgets

These can be :

a) Long-term budgets which contain financial estimates over a 3-5 years or even a longer period of time.

b) Short-term budgets which have implication for one year or lesser duration of time depending over the management philosophy.

advance will always be there. Immediately after a month or a quarter passes, as the case may be, a new budget is prepared for a twelve month period. The figures for a month or a quarter which have rolled down are dropped and the figures for the next month or the quarter are added.

3.3.2 Function Based Budgets

These can be further subclassified as under :

a) **Capital Based or Planned Budgets**

These are directed towards proposed expenditures for new projects and often require special financing e.g., setting up a MRI unit or CT Scan centre in a hospital providing tertiary level care.

b) **Operational Budgets or Non-Plan Budgets**

These are directed towards achieving short-term operational goals of the organisation. Simply put it should plan operations for the forthcoming period i.e., the finances required for running a particular health care organisation during a defined period of time.

c) **Cash Budget**

This is a summary of health care organisation's expected cash inflows and outflows over a particular period of time. In other words cash budget involves a projection of future cash receipts and cash disbursements over a period of time intervals. The overall objective of a cash budget is to enable the health care organisation to meet all its commitments in time and at the same time prevent the accumulation of large cash balances with it. A cash budget helps the management in :

- determining the future cash needs of the health care organisation.
- planning for financing for these needs.
- exercising control over cash and liquidity of health care organisation.

d) **Sales or Revenue Budget**

This generally forms the fundamental basis on which all other budgets are built especially in case of the corporate hospitals and private nursing homes/hospitals. The budget is based upon projected revenues or sales that are to be achieved in a budget period. It is desirable to break up the entire sales budget on the basis of different departmental or services and time periods.

e) **Expenditure or Production Cost Budget**

These can be further subdivided into :

i) Materials requirement budget

ii) Materials procurement or purchase budget

iii) Labour or personnel budget

iv) Overhead including distribution overhead budget

v) Research budget

All the budgets refer to the expenditure that is likely to be incurred under these various heads for providing health care service facilities to the designated or targetted community by a health care organisation.

f) **Master or Final Budget**

This is a summary budget which incorporates all financial budgets in a capsule form. It sets out plan of operations for all departments in considerable details for the budget period. The budget may take the form of a profit or loss account, fund flow statement and balance sheet at the end of the budget period. The master budget requires the approval of the Budget Committee, about which you will read a little later in this unit, before it is put into operation. It may happen sometime that a number of master budgets have to be prepared before the final one is agreed upon.

3.3.3 Flexibility Based Budgets

a) **Fixed Budget**

A fixed budget is required to remain unchanged irrespective of the level of activity actually attained. In other words a budget prepared based on a standard or a fixed level of activity is

called a fixed budget. In relation to a health care organisation which projects that it will be capable of providing appropriate services to say one lakh clientele in a year, the budgeted requirement will be projected to meet the expenditure involved for catering to one lakh clientele only. Since the budget does not change with the change of level of activity (say one and a half lakh clientele in the aforementioned case), it becomes an unrealistic yardstick in case the level of activity actually attained does not conform to the one assumed for the budgeting purposes. The management will not be able to assess the performance of different departments on the basis of budgets prepared by them, because they can serve as yardsticks only when the actual level of activity corresponds to the budgeted level of activity.

b) **Flexible Budgets**

This is a budget designed to change with the level of activity actually attained. The budget prepared catering to the budgeted costs for any level of activity is known as flexible budget. For preparation of flexible budgets the fixed and variable elements of cost changes that may have to be expected for each item at various expected levels of operations are arrived at and taken into account. Let us take an example :

An x-ray machine can take out say 10,000 x-rays at 100% capacity with the cost composition of :
Fixed Rs. 5,00,000
Variable Rs. 30 per unit
Semivariable Rs. 40 per unit of which 40% i.e., Rs. 16 per unit is variable and Rs. 24 is fixed.
Flexible budget for 80%, 90% and 100% activity level will be

Flexible Budgets

Units	8000 80%	9000 90%	10,000 100%
Fixed Costs	500000	500000	500000
Variable Costs	240000	270000	300000
Semivariable Cost–Fixed (Rs. 24@ 10000)	240000	240000	240000
Variable (40%) Rs. 16 per unit	128000	144000	160000
Total Cost	1108000	1154000	1200000

Within the range of 80% to 100% the computation has been given. If the increase in the actual level of activity is only 95% the computation of cost for the level of activity is easily possible as given below:

Fixed Cost	Rs. 500000
Variable Cost	Rs .285000
Semivariable Cost	
Fixed Cost	Rs. 240000
Variable Cost	Rs .152000
(Rs. 16@ 9500/unit)	
Total Cost	**Rs. 1177000**

Thus you can see that in a system of flexible budgets adjustments are provided for varied activity levels. Infact flexible budget is nothing but a series of fixed budgets catering to the estimates of revenues and costs at different activity levels. Based upon the flexible budgets the performance budgets can be prepared indicating revenues and costs for the actual level of activity.

3.4 BUDGET PROCEDURE AND ADMINISTRATION

Before we discuss the budget administration and procedure, we must be aware that if any benefits are to accrue out of budgeting, certain prerequisites are mandatory.

3.4.1 Prerequisites for Budgeting

They are :

- Clear identification of financial and service goals.

clearly defines all accountability.

- Participation of the staff members in the formulation of the budget.
- An accurate accounting system capable of accummulating and appropriately assigning all financial data.
- A chart of accounts that corresponds to the organisation structure and allows for the accummulation of actual cost data by cost and responsibility centre.
- A management information system capable of collecting non-financial data relative to total volume of services demanded and per cost centre workload.
- Management determination to make the budgeting process work.

It is critical to recognise that while organisation structures, data and procedures are all necessary, they are all of secondary importance when compared to capable management. Budgeting is fundamentally a people moving as opposed to a paper moving process. If budgeting is to be successful all levels of management must understand its value and limitations, how the budget is to be developed and used and their own specific roles and responsibilities in relation to the budgeted activity/output.

3.4.2 Budget Administration

The following steps are essential for administration :

a) **Preparation of Budget Manual**

Since a budget is formulated at the instance of top management, and details provided and compliance ensured by the subordinates, there has to be formal communication between the two. These could be in the form of oral as well as written instructions. A budget manual is an orderly presentation of these instructions or directives. The work relating to budget manual preparation should be coordinated by the budget officer. The details should be provided by the heads of the operating departments and the final outcome approved by the management. Each subsequent change, there after, should be approved by the management.

A budget manual is tailored to fit the needs of each hospital or a group of hospitals or the health care organisations/unit where it is to be used. The contents of a typical budget are outlined below :

- General statement of hospital objectives and budget procedures
- Identification of persons involved in the budget exercise, and definition of their powers, duties, responsibilities and area of their operations
- Routine for departmental budget preparation, their review and approval
- Time schedule for budget preparation
- Procedure for budget revision
- Budget reports
- Performance reviews
- Feedback for future budget planning

b) **Appointment of Budget Officer**

He acts as a coordinator when the budget is being prepared. He reports monthly actual performance comparing it with the budget, analysing the variables between the two by responsibility and cost centre and organises follow up action. The budget officer works under the guidance of the budget committee.

c) **Budget Committee**

The budget committee comprises the heads of the various departments with the chief executive officer or the Director Administration or the Medical Superintendant or the Finance Manager as the chairman. The budget committee has the following responsibilities:

- Identify various opportunities and set goals.
- Set specific targets to be achieved during the course of the year.
- Provides the guidelines for the preparation of the budget.
- Set time table for the completion of the budget exercise.

- Approve the budget of the department and consolidates departmental budgets into a total master budget.
- Review actual performance.
- Establish long-term budgets.

d) **Budget Calendar**

This indicates specific dates for preparing individual parts of the budget, discussing them with the concerned department heads and getting them approved. This ensures that each of the department receives adequate and appropriate attention and the whole exercise is completed by the due date.

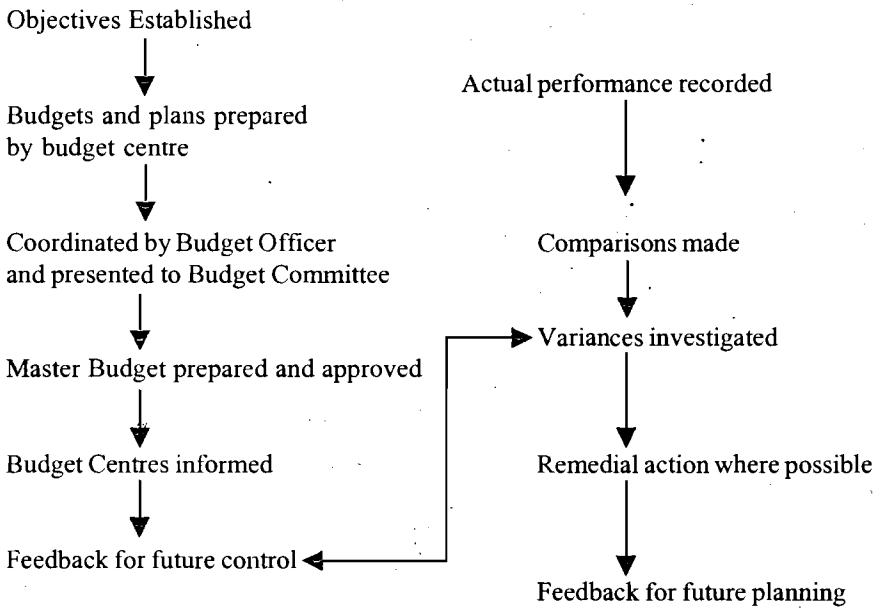
e) **Budget Period**

This means the period for which a budget is prepared and employed. Generally the budget period is taken to be a financial year, beginning on April 1st and ending on 31st March. The budget period can however be longer as well as shorter.

3.4.3 Budget Procedure

- The budget manual lays down the guidelines as well as standard procedures and formats based upon which the departmental heads or budget centre heads prepare the departmental budgets keeping in view the departmental objectives which should be a part of or contribute towards the overall financial and the service objectives of the health care organisation or the hospital.

Exhibit – Budget Procedure



- The budget officer guides the departmental heads in budget preparation and acts as overall coordinator in the exercise.
- The budget committee receives, reviews and consolidates the departmental budgets into a total master budget, which also incorporates and is supported by important functional budgets viz. purchases, engineering etc.
- After approval of the Master Budget and on the availability of the funds the budget is allocated and appropriated to various departments.
- The performance is then compared with the budgeted allotment and wherever required a midyear review is undertaken and if there are major changes in basic parameters, suitable alterations are made and budgets are revised for the second half of the year.
- The deviations from the budget allocation are analysed and then these variations are kept in mind as a feedback for the future budget planning and control.
- A brief outline of the budget procedure explained above is given in the exhibit :

3.4.4 Benefits of Budget Procedure

The benefits that accrue from using the budget as a management tool are :

a) **Orderliness in Planning Process**

The main budget is supported by departmental/functional budgets expressed in monetary/ quantitative terms based upon use of resources, income and costs. The plans are reduced to specifics to be achieved with provisions for continue review of performance. In the process a kind of orderliness is introduced. It guards against unplanned expenditure and undue optimism.

b) **Decentralisation of Accountability**

Since departmental heads/head of budget centres have been delegated the authority for preparing their budgets, buck passing is avoided.

c) **Performance Appraisal**

The budget provides a yardstick or norms for evaluation of performance.

d) **Coordination**

The key personnel are informed about the health care organisation goals, policies and procedures as well as about the environmental and organisational changes within which the budget is framed and what is expected from the individual manager. This budget exercise serves an important instrument for interpersonal and organisational communication as well.

e) **Creation of a Database**

The exercise results in ready availability of substantial data at one point. For example it could identify departments which need investments or the data provided in the budget detail sheets could be utilised to establish trends for future growths.

After becoming aware of budget administration and budget procedures to be followed we must now determine what are the prevailing techniques or approaches that are being practised or used for budgeting.

Activity 1

Study the hospital/health care organisation that you are involved with respect to the budgeting process on the basis of your study report or

a) What are the types of budgets that are prepared in the organisation?

b) How are budgets administered?

c) Are there any parts of activity which are not covered by the budgeting process? Identify.

3.5 APPROACHES TO BUDGETING

Various organisations use different approaches to budgeting. A few of the approaches being utilised and briefly discussed and described in the subsequent paragraphs.

3.5.1 Incremental Approach

This approach is a commonly used approach by majority of the health care organisations especially by governmental and public health care systems. In this approach the previous years spending level is extrapolated to the next year and incremental estimates for salary and cost of material are made. This level is further incremented to new projects and programmes expected to be undertaken in the following year to arrive at the final requirement.

In the incremental approach only the incremental portion of the previous years allocation are justified, the assumptions made are that all old activities are essential to achieve objectives, that these must be continued as they are more important than the new programme, that these are being performed in the most cost effective manner and would continue to be in future.

The drawbacks of the incremental budgeting approach are as under :

a) It analyses only the financial aspects.

b) Expenditures are not related to the intended or planned outputs (achievements).

c) It is basically accounting oriented, does not link inputs and outputs and hence there is no information about the activities and their contribution to the objectives of the health care organisations.

d) In the event of resource crunch, the acts are arbitrary.

e) It assumes that the cost efficiency of past activities would continue to remain the same in future years.

The incremental budget is thus equated to "an elephant with muscles of a mouse and brains of an amoeba". Consequently the surgeon does not know where to apply the scalpel to cut out the fat. Administrators feel frustrated as there is no relationship between expenditure and result and it does not provide adequate control over the inputs and outputs. Such a system of budgeting cannot be expected to promote operational efficiency. It may, on the other hand, create several problems for the management. Some of these are :

- Programmes and activities involving wasteful expenditure are not identified, resulting in avoidable financial and other costs.
- Inefficiencies of prior years are carried forward in determining subsequent years level of performance.
- Managers are not encouraged to identify and evaluate alternative means of achieving the same objectives.
- Decision making is rendered irrational.
- Key problems and priorities are not established.
- Managers/Administrators tend to inflate their budget requests resulting in more demand for funds than their availability.

In order to correct the shortcomings of traditional or incremental approach to budgeting, performance budgeting was designed by emphasising and incorporating both financial and physical aspects.

3.5.2 Performance Budgeting Approach

The technique was developed and recommended in 1949 and implemented by the US government.

The performance budget lays more stress on accomplishments and generates adequate information on costs and work accomplishments for decision making at appropriate levels.

Definition : Performance budgeting may be defined as the process of analysing, identifying, simplifying and crystallizing specific performance objectives of a job to be achieved over a period in the framework of the organisational objectives.

Main Objectives of Performance Budget

- To coordinate the physical and financial aspects of organisational performance.
- To improve the budget formulation, review and decision making at all levels of management.
- To facilitate better management and review by controlling authorities (Legislative, board of trustees, management boards etc.).
- To make more effective performance audit possible.
- To measure performance in relation to long-term objectives.

Essentials of Performance Budgets

- Formulating objectives which should be clearly defined and financially possible.
- Programme/activity classification which should be meaningful and bring out the main purpose. It is required to accomplish and should be in line with the objectives sought to be achieved through the expenditure of budgeted funds.
- Norms and standards setting is essential for establishing corelation between the

physical and financial aspects of a programme of activity. The setting of physical targets for accomplishment in respect of each programme activity is mandatory to enable working out of corresponding financial estimate for incorporation in the budget. Appropriate norms and standards supported by adequate data reduce subjective element and increase objectivity in framing and scrutiny of budget estimates.

- Preparation of periodic performance report comparing budget and actual data and showing variance in order to take corrective measure to avoid future deviation from the budget.

Format for Performance Budget

a) Introductory : It includes brief narration of the objectives and goals of the organisation in both qualitative and quantitative terms wherever possible.

b) Financial Requirements :
   - Work programme /activity classification
   - Objective-wise classification of expenditures like salaries, materials etc.
   - Source of financing indicating demand for grants etc.

c) Explanation of Financial Requirement : It attempts to corelate financial and physical aspects. It is to be prepared activity-wise and it should give to the extent possible workload factors, norms, standards and targets besides indicating the previous years performance and target requirements for input and detailed work plan and schedule. These aspects can be formatted as under :
   i) Name of activity Actual (last year) Revised Estimate (current year) Budget estimate (next year)
   ii) Name and purpose of activity
   iii) Physical works, input and outputs
      - Workload factors, norms, standards and yardsticks.
      - Progress during last and current year (Actual Vs Targets)
      - Explanation of variations
      - Targets for next year
      - Requirements for inputs including staff, training, materials and equipment
      - Detailed workplan and schedules.

3.5.3 Zero Based Budgeting Approach

The Zero based budgeting approach emerged as a consequence of the following :

a) A keen desire to ensure that scarce resources are optimally utilised.

b) Frustrations of the management as there was no relationship with expenditure and results obtained

c) Adequate control over input was not forthcoming or available.

Definition of Zero Based Budgeting

It is a planning and budgeting process which requires each manager to justify the entire budget request in detail from scratch (hence zero base) and shifts the burden of proof to each manager to justify why he should spend any money at all.

In zero based budgeting all activities must be evaluated to see which of them should be eliminated, funded at reduced level or funded at similar or increased level.

Objectives of Zero Based Budgeting

a) To evaluate claims on scarce resources in the light of hospital objectives.

b) To make tradeoffs amongst current operations, developmental needs, profits and availability of resources.

Process of Zero Based Budgeting

The Zero based budget has four basic steps as under :

a) **Identification of the decision content :** In the first step we have to identify the entities

of the health care organisation where the managers would be responsible to take decision on the expenditure and would prepare decision package.

A decision unit should not be at too low a level as it would increase the paper work nor it should be at too high a lev .l as this will prevent easy access and meaningful review or dialogue. Generally it may be a unit or a department of the hospital or it may be a project or a programme or a special assignment.

Once the decision unit is identified the zero based system requires an explicit statement of the objective of the decision unit in terms of future mission and long-term goal.

b) **Formulation of decision package :** Decision package is a document that identifies a specific activity in such a manner that management can evaluate it and rank it against other activities competing for the same or similar limited resources and decide whether to approve or disapprove it . There are two types of decision packages :

i) *Mutually exclusive decision package:* These identify the alternative ways of performing the same function. The best alternative is chosen and other discarded. The next step is to develop incremental packages.

ii) *Incremental decision packages :* This analyses, identifies alternative levels of effort or spending that may be expended on performance of an activity or function. It would identify the minimum level of activity or cost levels of efforts as separate decision packages.

An example would clarify the concept better. Let us take the case of a community hospital where the following activity is identified.

"Provision of ultrasonography facility in the Radiology department for the clientele".
The mutually exclusive package or the alternative ways of achieving the same function could be:

Package I : Ultrasonography facility provided by a nearby diagnostic centre which will charge the hospital on the basis of services rendered or on retainer basis.

Package II : The hospital management provides an ultrasonography machine within the Radiodiagnosis department of the hospital itself.

Let us assume that management has done a cost-benefit analysis on the two packages and has opted for the second decision package.

The mutually exclusive decision package would require to be complemented by incremental decision package in terms of personnel, equipment and maintenance facilities. Therefore, different levels of efforts or operational efficiency would also have to be identified in terms of whether additional qualified manpower will be required or not and whether maintenance is to be done by operating staff or on the basis of an annual maintenance contract. The financial implications, the result of financing and the consequences of non-financing at each level of effort will have to be worked out and included in the incremental decision package.

The decision package will generally contain the following items :

i) General Information : Title or name, level of effort, department, location, manager's name and to whom reporting.

ii) Description of the function or the activity

- Objective or function of the activity
- Tangible or intangible benefits to be derived from funding
- Consequences to result from non-funding
- Projected revenues and cost of decision packages
- Alternative approaches or packages.

Following subjects could be beneficially analysed and can be good issues for decision packages viz. cost or profit centres, people or programmes, services rendered or provided, capital expenditures, cost reduction or revenue enhancement.

c) **Ranking the Decision Packages :** This is achieved by :

- Listing all packages identified in order of decreasing benefit to the hospital or the health care organisation.
- Identifying benefit at each level of expenditure.
- Study consequences of not approving the decision package.
- Ranking of more than one decision package on the basis of perceived importance of priority for attaining the objectives.

The ranking is done at all the levels of decision units and continues till the top level, where decision package for the entire organisation are ranked in order of importance and a single consolidated list is produced.

d) **Allocation of Resources**

Once the final single consolidated ranking is done, the packages to be funded are separated from these not to be funded. The activities which are not amenable to zero base budgeting are added and the final budget prepared by allocating forecasted resources. Any increase in funding level can be done easily from the packages available which were discarded due to non-availability of funds. Reduction can be made by removing the low priority packages out of the packages in the event of resource scarcity.

Adequate feedback is also provided to the managers on the reasons for their decision packages being accepted or rejected.

Limitation of Zero Based Budgeting

- It is less applicable to those cost which have no direct cost benefit relationship.
- Greater amount of time and effort will be required in the initial stages.
- Identification and development of decision packages in case of non-quantifiable or intangible benefits would require a high degree of management expertise.
- There may be greater amount of paper work in zero based budget.

Advantages of Zero Based Budget

a) Financial
   i) Better allocation of resources
   ii) Improves productivity and cost effectiveness
   iii) Helps in reducing costs

b) Development of human skill and interpersonal relationship :
   i) Better communication between various heads and personnels of decision units.
   ii) Higher level of commitment to approved activities since subordinates are involved in preparing decision packages.
   iii) Improves interpersonnel relationships and espirit de corps.
   iv) Helps in sharpening of planning and control activities.
   v) Assists in evaluating the results of activities.

Note: Flexible /fixed approach to budgeting has already been discussed in section 3.3.

Activity 2

With respect to your own hospital/health care organisation, critically evaluate whether zero base budgeting can be effectively applied. For your hospital

- Identify the decision content
- Formulate the decision package
- Rank the decision package, and

suggest how the resources ought to be allocated, keeping in view the overall organisational objectives.

On reflecting on the foregoing it would seem reasonable to conclude that the budgetary process should be the centre piece of a hospital's or health care organisation's management system. Unfortunately this is often not the case. In one form or the other, most hospitals

and health care organisations typically have some type of budgetary process. Often, however, the budgetary process, due to insensitive designs or clumsy implementation acts only to burden or intimidate the staff. The net result in such circumstances is that budgeting often becomes little more than a paper exercise. More important the management focus shifts from using budgeting as a means for achieving the hospitals or health care organisation's goal to subverting the process, so as to blunt its influence on operating decisions.

For the value of budgetary process to be realised, its management power as well as its psychological, operational and interpersonal relationship subtleties must be recognised. In broad terms this means that the design and implementation of the budgetary process must be guided by common sense and an operational understanding that all processes have a set of biases to which the managers or departmental heads will respond.

Common sense is a phenomenon that is so simple and obvious in its conclusion, and so elegant in its presentation that until it directly confronts one, it is often difficult to see. To facilitate this confrontation, the above text has been conceived and written for it to be read, understand and applied.

3.6 LET US SUM UP

A budget is a quantitative statement of plan usually in financial terms covering a specific period of time. It is an important tool for financial planning and focuses on the future. It helps in uncovering inefficiencies in operations, in minimising wasteful expenditure and serves as a basis for education and evaluation of the managers.

The budget can be classified into different categories on the basis of time, or flexibility. The time based budget may be long-term, short-term or rolling budget. The based budget may be planned or unplanned budgets, cash budgets, revenue or expenditure budgets and master or final budget. The flexibility based budget may be fixed or flexible.

Certain pre-requisites are mandatory for process of budgeting. These are a well designed organisational structure, clear identification of financial and service goals, accurate accounting system, participation of staff members in budgetary formulation and commitment of top management.

The budgetary manual, which is tailored to fit the needs of each health care organisation or hospital, lays down the guidelines for budget preparation giving details of powers, duties, responsibilities and areas of operation of each executive or departmental heads in the organisation.

The departmental heads prepare the departmental budgets based upon the guidelines given in the budget manual and are assisted and guided by the budget officer. The budget committee receives, reviews and consolidates the departmental budget into a total master budget which is supported by important functional budgets viz. purchases, personnel, engineering etc.

The budget is prepared and employed for a particular period called the budget period and the budget calendar indicates the specific dates for the preparation and approval of individual parts of the budget. The actual performance against the budgetary outlays are recorded and variances are investigated to serve as future feedback devices for planning of subsequent budget. The budget procedure helps to bring about an orderliness in planning process, decentralises accountability and assists in fostering communication, coordination, creation of a database as well as in performance appraisal.

There are various techniques available for budgeting. The incremental approach which takes the current level of operations as the basis of estimating the future level of operation suffers from several drawbacks and is gradually being replaced by more modern approach that are more focused on accomplishments or achievements made i.e., performance budgeting. Zero base budgeting is yet another technique that suggests that an organisation should not only make decisions about the proposed new programme but should also form from time to time review the appropriateness of the existing programme. Each programme whether new or existing has to be justified in its entirety each time a new

budget is formulated. Zero base budget has the limitation of involving more time, effort and paperwork in the initial stages but its financial and managerial advantages far outweigh its limitations.

3.7 KEY WORDS

Budget : A statement in financial terms, prepared prior to a defined period of time sharing the strategy to be pursued during that period for the purpose of attaining a given objective.

Budget committee : It receives, reviews and coordinates departmental budgets into a total master budget and lays down the procedure for preparing and monitoring budget.

Budget calendar : It lays down the specific dates for preparation, discussion and approval of departmental budget with a view to complete the entire budget exercise within the desired or previously laid down period of time.

Budgeting : Process of making a budget

Budget manual : A document which incorporates the statement of the general objectives and budget procedures and sets out the responsibilities of the persons engaged in the routine of and the form and records required for the budget control.

Budget officer : An officer who coordinates the preparation of the budget, monitors its progress, analyses the variation by responsibility and cost centres and organises follow up action.

Budget period : The duration for which budget is prepared and employed.

Capital budget : It is the budget that is directed towards utilisation of funds for the acquisition of fixed or long lived assets or new projects from which a stream of benefits is expected to be received during future years.

Cash budget : It is a summary of cash inflows and outflows over a period of time.

Decision package : A document that identifies a specific activity in such a manner that management can evaluate it and rate it against other activities competing for the same or similar limited resources and decide whether to approve or disapprove it.

Decision unit : A significant programme individual department or unit or level of an organisation that can be analyed from the standpoint of describing and funding.

Fixed budget : A budget designed to remain unchanged irrespective of the level of activity.

Flexible budget : A budget designed to change in accordance with the level of activity actually attained.

Incremental budget : It is a traditional and commonly used approach of budgeting wherein the previous years expending level is extrapolated for the next year and the incremental for processes, material and inflation is added.

Master budget : Summary budget incorporating all components of financial budget which is finally approved, adopted and employed.

Non-planned or operational budget : It is the budget that is directed towards utilisation of funds for achieving the short-term operational goals.

Performance budget : A budget which specifies the outputs or results to be achieved along with the inputs or expenditures to be incurred during the budget period.

Zero base budgeting : An operational planning and budgeting process which requires each manager to justify his entire budget in detail from scratch.

3.8 SELF ASSESSMENT QUESTIONS

1) What do you understand by the term budgeting? Mention the types of budget that the management of a 750 bedded tertiary care hospital should normally prepare?
2) What are the prerequisites for budgeting?
3) State various steps essential for budget administration.
4) What is budget committee and what are its responsibilities?
5) Briefly outline the budget procedure. Enumerate the benefits of a budget procedure.
6) "The budgets never work out as planned. Conditions always change, so why bother to make them?" Enumerate the points that you would make, briefly when confronted with the arguments expressed in the above quotation.
7) Name the various approaches to budgeting.
8) Briefly describe the approach to budgeting being followed in your hospital and/or your health care set-up. State your role in the budgeting exercise, if any. Discuss the positive and negative aspects of the approach being followed. How would you improve it if you had your way?
9) Write a lucid note on flexible budgets.
10) What is a budget manual? List briefly its contents.
11) What are the advantages of incremental approach?
12) What are the objectives of Performance budgeting ? Briefly explain the performance budgeting approach. How it is better than incremental approach ?
13) What is Zero Base Budgeting? Briefly describe the process of zero base budgeting and list its advantages.

6) Match the following :

A	B
a) Capital budget	Summary of cash inflows and outflows
b) Operational budget	Justifies entire budget requests from scratch
c) Zero base budget	Planned budget
d) Cash budget	Programme and activity classification is a must
e) Performance budget	Non-planned budget

UNIT 4 FINANCIAL CONTROL

Structure

4.0 OBJECTIVES

After reading this unit, the student will be able to understand:

- the various tools of financial control;
- auditing procedures and audit objections; and
- do's and don'ts in financial management.

4.1 INTRODUCTION

Management control is the process by which the managers ensure that the resources are obtained and used economically to accomplish the organisation's objectives. It includes administrative and accounting controls. Administrative controls refer to the plan of the organisation, procedures and records that form part of decision making process and management's authorisation of specific transactions. Accounting controls ensure that the administrative controls are in their place.

Essential features of a financial control system are: (i) proper accounting system; (ii) existence of standards of performance; and (iii) regular review of actuals with what was planned. Its objectives are (i) income is properly accounted in the hospital accounting records; (ii) expenditure is genuinely incurred for hospitals activities; (iii) its resources are economically used; and (iv) the assets belonging to the hospital are in their physical custody.

For Accounting to be useful and reliable, the following are a must:

1) Adoption of mercantile system of accounting (recording of income and expenditure when they occur) instead of cash basis (recognising income and expenditure when actual cash receipts and disbursements take place).
2) Recognising depreciation as an item of cost.
3) Preparation of Income and Expenditure Statement and Balance Sheet at more frequent intervals, say monthly, soon after the accounting period is over.
4) Greater analysis of individual items of income and expenditure in Accounting books.

Hospital costs are rising in an unprecedented manner and there is a gradual realisation to make the services more cost efficient. Good financial management covers financial information, financial advice, cost analysis and cost control. The basic concepts in accounting, types of accounts and their application, account books and their maintenance, cost accounting, elements of costs, financial planning and financing and budgets have already been dealt in the previous chapters. This unit basically deals with the tools of financial controls and auditing.

4.2 TOOLS OF FINANCIAL CONTROL

Some of the relevant tools and strategies for financial controls in hospitals are:

1) budget,
2) financial analysis and control,
3) cost analysis and control,
4) financial reports and information system,
5) statistical analysis and cost control, and
6) cost containment.

4.2.1 Budget

The previous chapter has discussed at length about the definition, types, procedures for preparation, implementation and control of budgets. In spite of the various criticisms and deficiencies cited by various authorities, the financial budget continues to be a potent tool of management and financial control. As such, it acts as both an indirect and direct aid in controlling the operations within the hospital system. It provides the basis for management control by establishing the standard (the expectations) to which actual performance must be compared in order to identify out of control operational processes. It must be recognised that operational control cannot be effective, unless there is a standard – the budget, against which actual performance can be measured and evaluated. In short the budget control can be achieved through:

i) keeping a constant watch over the budget in action,
ii) continuously reviewing of actuals with the budget,
iii) analysing deviations in actual performance,
iv) taking remedial action where indicated,
v) revising the budget if conditions warrant.

4.2.2 Financial Statement Analysis and Control

This makes extensive use of financial statements such as, income and expenditure, balance sheet and financial ratios such as return on investment, earning per share etc., from the statements and ratios, the financial information, and evaluates the data with respect to liquidity, profitability and potential or actual problem areas and plan the various actions accordingly.

The income and expenditure statement for hospitals, the use of balance sheet and some of the important financial ratios are given below:

a) **Income and Expenditure Statement**

Income and expenditure statement reflects the results of the hospital's operations for a

stated period. Only broad classification of accounts is done. Details can be furnished in separate schedules. At times, functional indicators like income and expenditure per inpatient day, income per outpatient, etc. are given, and important statistics like admissions, discharges, fresh outpatients, repeat outpatients, patient days, etc., can also be given.

Usually, outpatient and inpatient income and expenditure are separately accounted. The income and expenditure of various departments are worked out department-wise. This is essential for the purpose of evaluating financial performance of each department, and in determination of costs of providing each service.

Income accrues from various routine medical services, support facilities, donations, grants, bank interest, investment returns, etc.

Record of expenditure for any free of cost or concessional care should be maintained separately. This is necessary to satisfy government authorities or organisations which give grants or subsidy. Cost of free and concessional care is shown as a deduction from the operating income.

Expenditures are incurred for salaries, supplies and materials, electricity, water, telephones, maintenance and contingencies, etc.

From the income and expenditure statements furnished at regular intervals, various rates and ratios can be calculated to ensure department-wise, facility-wise and operation-wise performance. A continuing decrease in incomes under certain heads calls for review of the management strategies of that department and accordingly plan the remedial measures. A continuing increase (disproportionate) in expenditure under different heads calls for evolving cost containment strategies.

There is a growing realisation amongst hospital administrators of the fact that if income and expenditures are continuously monitored, it provides the necessary information at a glance wherein the management controls are to be exercised and corrective measures required to be taken.

b) **Balance Sheet**

A balance sheet represents financial position as on a specific date. It is a statement of assets and liabilities. It reflects what the hospital owns and what it owes to others. Only total figures are given against each of the main accounts. Detailed schedules can be annexed if required.

A hospital's assets and liabilities consist of, though, not limited to the following:

Assets

1) Fixed assets: These are physical assets for long-term intended use.
   - Buildings
   - Land and grounds
   - Plant, machines and equipment
   - Furniture
   - Vehicles
   - Constructions in progress
2) Current assets : They consist of the following:
   - Cash in hand and bank
   - Short-term deposits and investments
   - Accounts receivable
   - Other receivables
   - Inventory of supplies and materials in stock.

Liabilities

1) Current liabilities

- Bills/Accounts payable
- Provisions for expenses

2) Long- term liabilities
   - Mortgages
   - Long-term loans
3) Special funds
   - Emergency fund
   - Endowment fund
   - Training fund

The balance sheet is a cumulative record of the assets, liabilities and owners' equity of an organisation. Whereas the income statement reports on the revenues and expenses of the organisation for a period of time such as a month or a year, the balance sheet reports on the organisation's assets, liabilities and owner's equity at a point in time, namely, the end of business of the last day of the accounting period. Thus, the balance sheet provides a snapshot of the organisation at a single instant, whereas the income statement provides a summary of the revenues and expenses accumulated during the period being reported. This is usually the time since the last financial statements were issued.

The format of the balance sheet follows the fundamental accounting equation:

Assets = liabilities + owner's equity.

Collectively, the current assets are called the working capital of the organisation. Working capital is used by an organisation for day-to-day operations to turn its capacity, as represented by its non-current assets, into products/services. Working capital management aims at safeguarding and controlling the hospitals' current assets and planning for sufficient liquidity to pay current bills. Excessive idle cash is identified and invested to earn a return while care is taken to avoid the risk of inadequate cash to pay bills on time.

The major use of the balance sheet as a financial tool is as a statement of an organisation's financial positions at a given point of time. It shows balances in permanent accounts and the effect of all accounting transactions since the first day of operation. When used in conjunction with income statement various financial ratios can be developed to gain an insight into the liquidity and management aspects of the organisation.

c) **The Statement of Cash flows**

In addition to the income statement and the balance sheet, there is a third major financial statement that must be prepared by investor-owned health care provider that is the statement of cash flow. The statement of cash flow summarises cash flows resulting from the three major management activitiesn such as operations, investments, and financing.

A statement of cash flows for an organisation may be given as:

Cash flows from operating activities

Cash received from patients	Rs. 6,000	
Cash paid to suppliers	(Rs. 5,000)	
Cash paid for operating expenses	(Rs. 2,000)	
Cash paid for rent in advance	(Rs. 3,000)	
Net cash provided by operating activities		(Rs.4,000)

Cash flows from investing activities

Payment on note related to equipment purchase	(Rs. 25,000)	
Net cash used in investing activities		(Rs. 25,000)

Cash flows from financing

Owners' initial investment	Rs. 1,00,000	
Proceeds from long-term debt	Rs. 50,000	

Net cash provided by financing activities	Rs. 150,000
Net increase in cash and cash equivalents	Rs. 1,21,000
Cash and cash equivalents at beginning of year	0
Cash and cash equivalents at end of year	Rs. 121,000

In addition to the actual statement itself, preparers are required to provide two related schedules: (1) Reconciliation of net income to net cash provided by operating activities, and (2) Supplemental schedule of non cash investing and financing activities. In addition, the organisation must present a disclosure of their accounting policies regarding the determination of cash equivalents.

d) **Funds Flow Analysis**

The funds flow statement indicates the sources from which funds have been obtained and the application thereof during a given period. It is important to finance the various assets by acquiring funds form appropriate sources. Adequate availability of appropriate types of funds is essential because finance is the life of an organisation. Projected funds flow statements are one of the important tools of financial analysis and planning.

It may be noted that 'funds refers to total resources' and working capital and not just to cash.

e) **Financial Analysis**

Financial analysis refers to the process of determining the significant operating and financial characteristics of the accounting data. Financial ratios help in financial analysis and are used to locate the symptoms of problems. Once the symptoms have been located, one has to determine the cause of the problem so that remedial measures are planned to correct the situation.

Financial ratios are useful in comparing the performance of different hospitals, different departments within the same hospital, and also in comparing the performance over different periods of time.

From all the financial accounts on the balance sheet, income statement, it is possible to formulate countless ratios. To be successful in financial analysis, the analyst must select only those ratios that provide significant information about the hospital situation.

A ratio expresses the relationship between two numbers, such as net revenues and net expenses. But it is difficult to evaluate a single ratio unless some standard or normative values are available for comparative analysis. The ratios can be useful when a combination of ratios are used to evaluate management performance.

Liquidity ratios and capitalisation ratios focus primarily on the balance sheet, whereas the performance ratios generally use data from the statement of revenue and expenses or income statement. Turnover ratios tend to use data from both balance sheet and income statement. Collectively, the ratios enable management to evaluate the financial condition of the organisation.

Liquidity Ratios

Current ratio is the most frequently used liquidity ratio. It relates current assets to current liabilities and is useful in identifying possible short-term liquidity problem. A ratio greater than one is considered to be a sign of prudent liquidity management, for this allows a margin of safety in an organisation's ability to meet its current obligations.

Current ratio = current assets/current liabilities

A high ratio may indicate an excessive amount of current assets and may indicate a failure to properly utilise the resources. Whereas a low ratio is an indicator of the fact that the hospital may not be able to pay its future payments in time.

The quick ratio or acid test is a more precise measure of liquidity than the current ratio because inventories, which are the least liquid of current assets, are excluded from the ratio.

Quick ratio (Acid test ratio) = Current Assets – Inventories/ Current liabilities

A higher ratio than one indicates that there is excess cash or receivables, both signs of lax management. A low ratio is usually an indication of possible difficulties in prompt payment of future bills.

Solvency Ratios

Long-term Debt to Fixed Assets = Long-term Debt ÷ Net Fixed Assets

Ratio of the proportion of fixed assets financed through long-term debt. The higher the ratio the less relative security perceived by a lender and the more difficult it will be for the hospital to secure future loans.

Long -term Debt to Equity =Long-term Debt ÷ Equity

Ratio of the two long-term sources of the hospital's financing. As this ratio increases the hospital becomes more highly "leveraged," and its ability to acquire future debt financing is reduced.

Debt Service =Net Income + Depreciation÷Debt Principal Payment + Interest

Ratio that measures the ability of the hospital to pay its debt, both principal and interest. The higher this ratio the more secure the lender and the greater the hospital's future debt capacity. This ratio identifies the relationship of debt capacity to earning and cash flow. Commonly used variations of this ratio are:

Net Income + Depreciation÷Interest &
Net Income + Depreciation÷Total Liabilities

The first is the measure of the hospital's ability to pay interest expenses and the second is an indicator of the cash available to meet all obligations.

Activity Ratio

Total Asset Turnover = Total Revenue ÷ Total Assets

Ratio that is used to indicate the relative efficiency of the use of assets. Typically, high values for this measure are viewed as indicating higher levels of performance. The denominator of this ratio should be net of depreciation. Variations of this ratio include fixed asset turnover and current asset turnover. While these activity ratios can be used as surrogate measures of efficiency, other indexes and factors must also be considered, e.g., occupancy rates, plant age and design, payer mix.

Inventory Turnover =Total Operating Revenue ÷ Inventory

Ratio that measures the hospital's investment in inventories. Low values typically imply overstocking, an excess investment and an inappropriate use of assets.

Operating Margin

Operating Margin = Total Revenue — Total Expenses÷Total Revenue

Ratio of net income to total revenue. It is measure of profitability. Operating margin can be calculated in aggregate as well as for patient care services and non-patient care services (non-operating revenues). In this measure the revenue figures should reflect net revenue, that is, revenue less contractual adjustments.

Return on Assets = Income + Interest Expense ÷ Total Assets

Ratio of net income to total investment in the hospital. It is measure of the relationship of operating margin (total revenue – total expense) to the assets, that is, the investment, in the hospital. Interest expense is added back to eliminate bias due to the method of financing the assets. The ratio can also be calculated net of interest expense.

Non-operating Income Contribution = Non-operating Net Income ÷ Net Income

Ratio of non-patient care services (non-operating) net income to total net income. It [illegible] importance of non-operating revenues to the hospital's overall

purpose of operating margin ratio is to provide an indication of how effectively the hospital is making resource deployment decisions. Operating margin ratio also related to liquidity and the hospital's ability to attract and service debt (capital structure), in that as profitability increase so can liquidity and debt capacity. Conversely, as profitability erodes so do liquidity and resulting debt service capacity.

4.2.3 Cost Analysis and Control

The aim of cost accounting is to ascertain unit costs with a view to achieve the following objectives:

1) Reducing the costs of providing high quality medical services.
2) Infusing a sense of accountability amongst the various managerial personnel.
3) Providing guidance for the preparation of budgets.
4) Assisting management in taking future policy decisions.

One of the significant characteristics of a hospital is that it has a number of specialised departments rendering medical services to the patients, with the support of several ancillary departments. In view of this feature, costs are determined department-wise. Thus, while the financial accounts arrive at the total expenditure of the hospital as a whole, classified under various heads of account, the cost accounts record the transactions in greater detail with a view to arriving at the total expenditure as well as the unit cost in respect of each ward, department and activity.

The commonly adopted methods for distribution of cost department-wise have already been discussed in the previous units.

4.2.4 Financial Reports and Information System

The hospital administrator must be conversant with the financial status on a week to week and month to month basis and in the long perspective. It is the duty of the finance officer to provide reports on financial performance and explain the situation on regular basis to the administrator.

The assessment of end results cannot be possible without accurate data provided on timely basis. Information about the actual outcomes should be available through the management information system in standardised format. Purposeful statistical data collection and reporting are essential for effective financial managerial control. Data processing services generate reports allowing monitoring of revenue and expenses, manpower control and services utilisation.

Daily Reports

1) Inpatient census, admissions, discharges
2) Outpatient visits – new and repeat
3) Tests carried out in laboratory, x-ray etc.
4) Daily bank and cash position.

Monthly Reports

1) Monthly statement of income and expenditure with department-wise break-up.
2) Budget versus actual cash position – detailed comparison of actual to budget sources and the application of cash.
3) Free and concessional care.
4) Operating indicators – this includes number of admission, discharge, patient days, outpatient visits, investigations, operation theatre utilisation, etc.

Quarterly Reports

Budget performance of all departments.

Yearly Reports

1) Balance sheet

2) Income and expenditure statement
3) Departmental income and expenditure statement
4) Cost analysis – cost of services, unit costs.

Points of Control

It is impossible for one person to check each and everything. But the following points shall need attention.

1) Cash receipt and payments
2) Purchases, consumption and inventory of consumables
3) Patient billing
4) Assets accounting
5) Accounts payable
6) Accounts receivable
7) Accounting of scrap
8) Accounting of packing material
9) Vehicles
10) Utilisation of plant, machinery and equipment
11) Payroll
12) Missing charges and un-collectable patient accounts

Activity 1

Enumerate the important financial information reports generated in hospitals. How does the hospital administrator make use of these reports?

4.2.5 Analysis of Hospital Statistics and Cost Control

The aim of analysis of hospital statistics and control is to achieve improvements in the utilisation of the following resources:

1) Manpower
2) Bed capacity
3) Plant and equipment
4) Stores and supplies

The key statistics in a hospital is the 'patient day' which may be defined as the number of patients to whom lodging and other services have been provided in the hospital between two successive census taking hours. The 'patient day' is a key statistic as it is used for computing the cost per patient day, which facilitates the evaluation of the performance of the hospital.

The cost per patient-day is the key financial statistic used for the evaluation of hospital performance as a whole, as well as the performance of individual departments. The cost per patient-day or bed-day for the hospital as a whole is ascertained by employing the following formula:

Total expense in rupees ÷ Total number of patient-days

For ascertaining the cost per patient day or daily bed cost for an individual department, the following formula may be used:

Total departmental cost ÷ Number of patient-days of the department

If the data pertaining to patient-days are compiled class-wise, it would be possible to arrive at the class-wise per bed/per day expenses.

The Hospital census: The total number of in-patient occupying beds in the hospital at the census-taking hour denotes the hospital in-patient census.

The average daily census is derived by using the following formula:

Number of patient-days during the period ÷ Number of calendar days during the period

Percentage of occupancy: This is calculated by using the following formula:

Patient Days ÷ Bed Days × 100

The percentage of occupancy is useful from the following points of view:
Deciding about future expansion, which would be further facilitated if a record is maintained of the number of admission refused.

Measuring the utilisation pattern of hospital capacity

The endeavour of the hospital should be to maintain a uniform level of occupancy over a period of time, since a low level of occupancy would raise the daily operating cost as a substantial part of its expenses, in the form of payroll expenses, would be fixed.

Average length of stay: This is calculated by using the following formula:

Total number of patient-days during a period ÷ Total number of discharges and deaths during the period.

A comparison of the average length of stay per patient over a period of time or with other hospitals is very useful as it may reveal, for example, that patients are spending more time in the hospital than required thereby causing an insufficiency of bed capacity. The concept of average length of say is obviously very important in a country like India, where the demand for hospital services is always much greater than the availability of the same.

Other statistical performance indicators:

1) Number of patients treated per available bed.
2) Staff per in-patient case (divided into principal categories of staff).
3) Theatre sessions per bed.
4) Energy (power) used per air-conditioned volume.

The various statistics mentioned in the foregoing paragraphs may be studied by means of trend analysis. The trend analysis usually commences with an analysis of the 'Cost per patient-day'. After ascertaining the trend in the cost per patient-day, trend in the secondary ratios may be studied in order to ascertain the causes that influenced the trend in the primary ratio (that is, the cost per patient-day). Such a trend analysis may be carried out by graphing the ratios over a period of time.

Activity 2

1) What is the role of bed occupancy and average length of stay in exercising financial controls of hospitals? Answer with reference to your own hospital.
2) How are periodical calculations of cost per patient per day useful to the hospital administrators?

4.2.6 Cost Containment

With the changing technology and clientele attitudes towards better and modernised services, the nineties have witnessed an unprecedented rise in various costs in health institutions. As on day, every type of hospital and health care institution is concerned over the rising cost of patient care.

The key to success in cost containment lies in cost awareness, cost monitoring and cost management.

No cost control programme can be implemented in absence of adequate data on costs incurred. A good integrated hospital information system, personnel data and quality control is a basic requirement for effective cost control activities.

It is generally expected that hospital costs could be contained with the following

approaches, which may directly or indirectly influence the costs and efficiency in hospital functioning. These are:

1) Creation of cost consciousness amongst functionaries of the hospital.
2) Rationalisation of staffing patterns of the hospitals.
3) Instituting a department-wise quarterly budget variance report to review actual to budget comparison and pinpoint problem areas.
4) Computerisation of patient accounting and administrative records.
5) Proper forecasting of materials, group purchases, inventory control, standardisation and value analysis in a scientific materials management.
6) Preventive maintenance of buildings and equipment.
7) Shutting down electricity, air conditioners, etc. when not required.
8) Eliminating wastage and pilferage.
9) Cost effective planning of facilities and services
10) Information booklets should be supplied to all functionaries giving details about the costing of services.
11) Introduction of multipurpose workers to take up various semi-skilled/ unskilled jobs.
12) Contractual services for security, housekeeping, laundry, CSSD, ambulances etc.
13) Approaches like day care surgery, camp approach and quality management be practised.
14) Proper training of staff in professional management for cost effective services.
15) Management information system in hospital should aim at cost effectiveness.
16) Norms and standards of staffing and equipment should be formulated based on work-studies.
17) Physicians are the key persons to reduce costs through;
    - cutting down length of stay .
    - cutting down unnecessary investigations
    - cutting down unnecessary drugs and therapies
    - economise the use of hospital supplies, facilities and manpower.
18) Periodic evaluation of different activities of the hospital along with medical audit will help in cost containment and efficiency in services.
19) Privatisation of certain hospital services specially those which are underutilised.

4.3 AUDITING

Audit is by and large a post verification based on records. The transactions appearing in accounts are judged against predetermined rules, regulations, norms, and standards.

4.3.1 Definitions

1) **Montgomery:** Auditing is a systematic examination of the books and records of a business or other organisation, in order to ascertain or verify and to report upon the facts regarding its financial operation and the result thereof.
2) **Lawrence R. Dicksee:** An audit is an examination of accounting records undertaken with a view to establishing whether they correctly and completely reflect the transactions to which they relate. In some instances, it may be necessary to ascertain whether the transactions themselves are supported by the authority.
3) **M.L. Shandilya:** Auditing may be defined as inspecting, comparing, checking, reviewing, vouching, ascertaining, examining and verifying the books of accounts of a business concern with a view to have a correct and true idea of its financial state of affairs.

4.3.2 Scope of Audit

1) To check the arithmetical accuracy of the accounts.
2) To check the books of accounts with the help of all the relevant vouchers, invoices, correspondences, minute books, etc.

3) To verify the assets and liabilities shown in the balance sheet.

4) To report to the client on the basis of his findings.

4.3.3 Objectives of Audit

1) Ensuring the correctness and completeness of accounts.

2) Ensuring regulations of expenditure by examination of accounts.

3) Looking into the honesty of financial transactions to detect errors and frauds.

4) Ensuring that the funds expended by institution have produced the desired results.

4.3.4 Limitations of Audit

Auditor has nothing more to do than merely checking, ticking, totaling and vouching the books of accounts. The ultimate object is to detect clerical errors pertaining to the accounts.

Since the audits are based on available documents and are post facto appraisals, the circumstances of the transactions and the market conditions cannot be verified by the auditor. An auditor is to act as a watchdog on verification of statements and transactions.

Until and unless the auditor is familiar with modern changes and the technical nature of hospital job, he cannot perform his functions with ability and prudence. To perform effective audit work, coordination between hospital functionaries and auditors is very essential.

4.3.5 Types of Audit

The audits may be of two main categories, i.e.,

1) according to the organisational structure of the undertaking.

2) from practical point of view.

1) **According to Organisational Structure of the Undertaking**

i) ***Statutory Audit***

It is made compulsory as per statute. Joint Stock Companies, Trusts and other corporate bodies such as Insurance Companies, Banks, Reserve Bank of India, Industrial Finance Corporation, Cooperative Societies, etc. fall under the category.

ii) ***Private Audit***

The audit of the accounts of sole traders, partnership firms, individual institutions, which are private in character get their accounts verified by some qualified auditors. Such an audit is not required by statute.

iii) ***Government Audit***

The government maintains a separate department in the name of Accounts and Audit Department, which performs the audit of its different departments and offices. This department is headed by The Comptroller and Auditor-General of India who is assisted by different officials at various levels.

The duties and liabilities of such auditors are not defined by statute. They are not public auditors and hence, cannot be appointed auditors for public concerns. They are meant for government departments and as such, they work according to the departmental rules and instructions.

They check the sanction and expenditures, bookings, stocktakings, etc. as rules and regulations laid down by the government.

iv) ***Internal Audit***

The Institute of Internal Auditors has defined internal audit as given below:

"Internal auditing is the independent appraisal activity within the organisation for the review of the accounting, financial and other operations as a basis for protective and constructive service to the management. It is a type of control, which functions by measuring and evaluating the effectiveness of other types of controls. It deals primarily with matters of an operating nature."

Internal audit is the examination of books of accounts, which is conducted by the salaried officials of a business concern known as internal auditors throughout the year. The scope of internal audit is a bit different. It is more closely related to managerial functions than to accounting duties. When an outside auditor would ensure after scrutiny of accounts that such records are correct and are being maintained in conformity with the relevant law, an internal auditor, besides doing so, would see that the work of the business is going on smoothly, efficiently and economically. Internal audit is, thus, an independent appraisal of activity within an organisation for reviewing the accounting, financial and other operations. It renders a productive and constructive service to management.

2) **From Practical Point of View**

i) ***Continuous Audit***

A continuous audit is an audit that involves the conducting of audit of accounts throughout the year at regular intervals, fixed or otherwise, say, one month or more months. The accounts in such a case are subjected to audit as and when they are prepared. An auditor in continuous audit pays visits at regular or irregular intervals all the year round and examines the accounts. Such an audit is necessary only for big business houses and not for small ones where accounts can be audited at the close of the financial year when they are ready.

ii) ***Annual or Periodical or Final Audit***

Annual or periodical audit is done at the close of the financial or trading period when final accounts are prepared. In such a case, the auditor visits his client only once a year and checks the accounts in one visit till he is not in a position to cover the accounts pertaining to the whole of the period.

iii) ***Cash Audit***

In cash audit, the auditor is concerned with the checking of cash transactions. He has to audit entries pertaining to cash receipts and payments with the help of relevant vouchers. Since his work is done under such restrictions and limitations, he submits his report accordingly. He can mention the fact in his report.

iv) ***Cost Audit***

Cost audit is performed in some special circumstances but the purpose behind such an audit is to verify the cost accounts so as to ensure how far cost accounting plans have been adhered to.

v) ***Complete Audit***

When an auditor is appointed to check each and every transaction, total, balance, book of accounts with the help of the relevant vouchers, documents, correspondence, etc., it is said to be complete audit. Under complete audit, nothing is to be left from checking by an auditor. But complete audit is neither practicable nor feasible.

vi) ***Partial Audit***

In the case of complete audit, all the records and books of accounts are subjected to audit by the auditor but when audit is conducted on some of the records and books of a part or whole of the period, it is called partial audit. Partial audit may relate to some part of the work for some or whole of the trading period. Partial audit is not practicable again.

vii) ***Management Audit***

It is an audit conducted to examine all aspects of management of the organisation. Improvement in efficiency and maximum utilisation of resources of the organisation are the tools for its success. The management auditor has to evaluate the overall performance which include account books too and he has to submit a report stating whether the predetermined targets and objectives have been achieved or not. It is related to the process of management. Thus this type of audit is connected with every aspect and helps in improving performance.

viii) ***Propriety Audit***

During a propriety audit the auditors try to bring cases of improper or avoidable expenditure even though the expenditure may have been incurred in conformity with existing rules and regulations. Though a transaction may satisfy all the requirements of regulatory audit but as far as formalities regarding rules and regulations are concerned it may still be highly wasteful.

ix) ***Performance Audit***

The focus of performance audit is to ensure whether the results achieved have been commensurate with the expenditure of resources. It is also called efficiency audit or operational audit. The basic aim being determination of efficient use of resources.

Activity 3

Enumerate the various types of audit that has been conducted in your hospital. Explain the process.

4.4 VOUCHING

We all know that the accountant does not enter any transaction in the books of original entry for which he has not got proper documentary evidence. If he does, it is an irregularity in the strict sense of the term and such a step of the accountant would be an example of fraud leading to some manipulation of accounts or misappropriation of cash or goods. Hence, there should be no entry in the books without a voucher and no voucher without its entry. Every voucher must also, therefore, be recorded in the books.

Thus, when an auditor verifies the authority and authenticity of transactions as recorded in the books of accounts and submits his report accordingly to the effect that the accountants are correct, complete and free from errors and fraud, he has to see that the entries passed in the books of prime entry are properly made, are supported by proper documentary evidence and are also in order. This is known as vouching.

4.4.1 Definition

"Vouching does not mean merely inspection of receipts with the cash books, but includes the examination of receipts with the transactions of a business, together with documentary and other evidence of sufficient validity to satisfy an auditor that such transactions are in order, have been properly authorized and are correctly recorded in the books." – De Paula

4.4.2 Objectives

In vouching an auditor verifies the authority and authenticity of transactions as recorded in the financial books so that he can satisfy himself that:

i) all transactions connected with the business have been recorded in the books of accounts and nothing pertaining to the business has been left as unrecorded;

ii) no transaction which is not connected with the business has been recorded, i.e., no extra item having no concern with the business has been entered in the books; and

iii) all entries for transactions, which are authorized, are genuine and supported by documentary evidences, which are available in the business.

The basic purpose of checking entries by reference to appropriate documentary evidence is to ensure that the transactions relating to a particular period have been recorded and there is no voucher left unrecorded in the financial books. Only after verifying the vouchers, the auditor can be sure of the genuineness of various financial statements. That is why vouching is said to be the backbone of auditing.

4.4.3 Vouchers

Vouchers are the documentary or other evidence in support of transactions entered in the books of accounts. They may be of two types:

1) **Primary:** A written evidence in original is said to be the primary voucher, e.g., invoice for a purchase.

2) **Collateral:** When the original voucher is not available, copies thereof are produced in support or subsidiary evidence is made available so as to remove suspicious and to satisfy the auditor. Such a voucher is usually known as a collateral voucher.

The correspondence, contracts, documents, receipts, invoices, bills, minute books for recording resolutions or any other similar document are vouchers, which are quoted wherever necessary.

While examining vouchers the following points should be noted by the auditor:

1) **General**

   i) All vouchers are serially numbered.

   ii) The vouchers that have been examined/verified by auditors are cancelled.

   iii) The entry of vouchers relates to particular record and that relevant entry is checked by auditor in respective books of accounts.

   iv) As far as possible, the work relating to particular period should be finished in continuous sitting.

   v) The auditor should see that each and every voucher has been certified as correct by a responsible officer and his signature put on it.

   vi) For missing vouchers, duplicates are verified by exercising due care.

   vii) While examining vouchers, the auditor should see that they are properly entered in the proper financial books. Sometimes, proper allocation of items is not made between capital and revenue. This should invariably be done to maintain correct record and ensure faultless final accounts.

   viii) Test checking should be resorted to only in special circumstances when the auditor is satisfied with the internal check system in operation, otherwise detailed checking should be done. After all, absolute responsibility is his.

2) **Particular (i.e., relating to the voucher itself)**

   i) The date, amount and name of the client should be carefully examined.

   ii) The relevance of voucher to the business itself, i.e., goods purchased and expenses incurred during that particular period.

   iii) The vouchers should be on printed forms of the payee and amount should be written in words and figures.

   iv) If the voucher relates to cash payment above Rs. 500/-, it must have a revenue stamp of Rs.1/-.

   v) Every voucher should be signed by some responsible officer on behalf of the payee.

   vi) The contents of a voucher should be examined with references to the particulars of the relevant entry so as to ensure that they tally as regards to the amount, date, etc.

   vii) It has to be remembered that if some alteration is made in the voucher, it is properly initiated by the invoice clerk.

Thus, it will be seen that while comparing vouchers with the entries made in the books of account, the auditor should be able to verify the following:

1) The authority of the voucher;

2) The authenticity of a transaction;

3) The proper classification of the account; and

4) The accuracy of the amount and correctness of the details connected with an entry.

To carry on the function of vouching the auditor has to be familiar with various functions and forms of the different organisations. Since the amount of transactions in the organisations is on increase, mechanised accounting machines are used to facilitate and provide mechanism to apply controls and checks. The mechanised system has its advantage and disadvantages and the auditor has to keep himself fully conversant about the issues involved.

Activity 5

1) Discuss the various types of vouchers in day to day hospital expenditures with reference to your hospital.

2) How will you vouch the following items in accounts of a hospital:

   a) local purchase of medicines

   b) remuneration paid to contractual workers

   c) contingent expenses

4.5 SPECIAL POINTS IN THE AUDIT OF HOSPITALS

The activities of a hospital are fundamentally different from those of any other organisation. It is, therefore, necessary to follow a specially tailored audit programme.

The auditor should examine the documents relating to the constitution of the hospital and ensure that the provisions relating to accounts and audit, incorporated therein, have been duly complied with. He should also ensure that the acquisition and disposal of fixed assets and investments, the engagement of personnel and other matters which affect substantially the finances of the hospital are properly authorized by the governing body and appropriately recorded in the Minutes Book. He should also examine the contracts and agreements affecting finance and accounting substantially.

In view of the uniqueness of the activities of a hospital, comparison of the financial figures of two periods may not necessarily be valid. Thus, the auditor cannot too much reliance on the comparative figures of two years for detecting internal irregularities, though such a comparison can certainly guide the auditor in identifying the areas where should spend more time on verifying the figures.

A hospital does not sell a commodity, but renders a service by allowing the use of beds and other specialised facilities. The control of the occupancy of such beds and the use of the special services is not easy, but is nevertheless very important. The auditor must satisfy himself that all services rendered are billed and that all bills have been recorded in the accounts correctly. For this the auditor must refer to the Bed Occupancy Summary, the Daily Admissions and Discharges Summary, the Housekeeper's Report, the Daily Summaries of Special Services Charges and the Patients' Fee Journal. If the figures appearing in the foregoing reports/records do not tally, the differences should be investigated. The auditor should make use of the statistical information compiled by the hospital for performing overall tests of revenue.

The auditor must ensure that the system of recording transactions is prompt. This is necessary because a patient may be discharged at any time and if the billing is not prompt, charges for some of the services rendered may remain uncovered. The auditor should, therefore, carefully examine the system of raising bills and test check the bills raised by referring to the Admissions and Discharges Register, the Departmental bills for Special Services and the hospital's schedule of rates. In the case of patients to whom free medical care has been provided, the auditor should ensure that this has been done in accordance with the relevant rules and regulations.

If discounts are allowed to patients, the same should be recorded separately and the revenue should be recorded at the gross figure. The auditor should examine the internal controls in respect of such allowances, which may be in the nature of charity allowances, policy discounts to employees and others, and contractual adjustments with, for example, insurance companies. The authority to allow discounts should be vested in persons who are not connected with the cash and billing functions.

The auditor should see that items 'paid-out' on account of patients are properly charged up to them and have been duly collected.

The procedures for the receipt and acknowledgement of gifts and donations should be examined.

The amounts received by way of grants should be verified by the auditor with reference to the relevant correspondence with the government/local authority and also the statutory rules relating to such grant-in-aid.

The auditor must ensure that adequate control procedures are in effect in respect of free drugs, food and other items received by the hospital.

As regards investments, the auditor should make inquiries in respect of the following matters:

1) Whether the investments are made in accordance with the relevant gift deeds.
2) Whether there has been any permanent fall in value of investments.
3) Whether a proper procedure exists for recording investments received as gifts.

Most medicines have an 'expiry date'. The physical issue of stock should, therefore, be on a 'First-in, First-out' basis.

Cash transactions constitute a large proportion of a hospital's activities and, therefore, the auditor must pay considerable attention to the same. He must ensure that all receipts are accounted for and that all payments are properly authorized. Surprise cash counts should be conducted and bank reconciliation statements should be checked thoroughly. Internal controls in respect of all the cash collection points should be reviewed.

In respect of fund balances, the description, classification and utilization of such balances should be reviewed by the auditors in the light of the available documentary evidence. The transfers of amounts between funds should be in accordance with donor's instructions and should be appropriately authorized by the governing body of the hospital. The incomes from the related investments should be appropriately accounted for.

Activity 5

1) What steps would you take before commencing actual work of audit in a hospital?
2) You have been asked to audit the first annual accounts of a newly established hospital. What information you would ask for before commencing the audit?

4.6 AUDIT OBJECTIONS

In the performance of various audits, certain lapses or irregularities are likely to be noticed by the auditors. A detailed parawise report is furnished to the management to explain the lapses or to fix up responsibility on erring officials (if it is so), so that corrective measures are taken and procedures streamlined for future. The common audit objections relate to:

1) The cash in hand may not tally with entries in cash book and other supportive documents.
2) The expenditure incurred on any activity may not have the sanction of competent authority.
3) The entries in various account books and payments made may not be supported by vouchers.
4) Entries in the stock book may not tally with inspection note of goods received.
5) The principle of separation i.e. separate authorities as prescribed for handling cash and stores, etc. may not be followed.
6) Records of distribution of drugs and other goods may not tally.
7) Proper accounting procedures and entries may not have been observed indicating certain misappropriations or frauds.
8) The expenditure is not done as per allocation under different budgetary heads and as per delegation of powers.
9) Normal purchase procedures are avoided by making repeated local purchases/split purchases.
10) The various documents like vouchers, account books, stock books, etc. are not serially numbered.
11) Payment of third party is not made as per prescribed procedures of cash is paid instead of cheque, wherever so prescribed.
12) Vouchers are missing and there are no collateral documents to support expenditures.
13) There may be unsigned vouchers or alterations in vouchers that have not been initiated/altered.
14) The prescribed procedure for purchase of articles (as per general financial rule/ prescribed rule) has been violated.
15) On physical verification of stocks shortage/surplus stocks are found.
16) The medicines have expired or expired medicines are issued.
17) Tender conditions with regard to submission of earnest money, samples or certificates as required are flouted.
18) Items are not been issued against a proper indent from an authorized authority.

19) The prescribed procedures for placement of supply orders, the risk purchases penalty to be imposed if any have not been followed.

20) Condemnation of articles has not been approved by the competent authority.

In short wherever the auditors observe that the procedure followed does not confirm to the laid down procedures, rules and regulations, an audit objection shall be raised for submitting explanation/reply/fixation of responsibility, as the case may be.

4.7 IMPORTANT ISSUES FOR FINANCIAL CONTROL IN HOSPITALS (DO'S AND DON'TS)

1) It is necessary to ensure that all cash receivable is in fact received and properly banked. Cash payments should also be made in right amounts and under proper authority.

2) Assets such as drugs, medical and surgical supplies and food must be adequately protected and appropriately preserved from pilferage, spoilage, wastage, destruction, etc. Suitable measures have to be adopted for the preservation of assets such as linen, sheets and blankets, cutlery and crockery, etc.

3) Management information should indicate the economy and efficiency with which operations have been carried out and scarce resources utilized, so that optimum utilization of such resources can be achieved. It should provide adequate financial, statistical and costing information to facilitate proper analysis so that steps can be taken to improve performance, increase productivity and control costs.

4) The clerical accounting functions relating to the recording of invoices, purchase bills, expense bills, cash and bank transactions, ledgers and inventory movements should be taken over by the computer.

5) No formal accounting entries are required to be passed in respect of Stores Requisitions. Entries will, however, be made in the Stores Ledger.

6) No formal accounting entries are required to be passed in respect of Stores Returned Notes.

7) The purchase of inventories and receipt of the same should be under the charge of different employees, whose duties should not overlap.

8) Similarly, the duties of receiving the inventories and the subsequent custody (storekeeping) of the same should be assigned to different persons.

9) Physical stock-taking should be carried out at regular intervals by employees who are not in charge of the inventory.

10) Inventories should be physically controlled by using appropriate locks, keys and guards and issues should be made only against proper authorization.

11) All documents should be pre-numbered in order to ensure their physical control.

12) The physically taken inventory should be compared with the inventory as per the records and an 'excess/shortage' statement should be prepared and reviewed critically.

13) Review procedures should be laid down to ensure that transactions are recorded in the proper period.

14) The values of materials received, as appearing in the stores records, should be periodically cross verified and reconciled with the corresponding purchase accounts appearing in the financial records.

15) Invoices should be reviewed as to services received, prices, extensions and castings by personnel who are independent of the purchasing function. Personnel holding responsible positions in the Accounts Department should grant final approval of invoices. Such approval should be granted only after it has been ensured that the required clerical work of checking and comparison has been properly performed.

16) Bills for Special Services should be cross checked with Special Services Requisition Forms in order to ensure that the special services departments have in fact prepared bills for all the services rendered by them.

17) As regards cash receipts, the following safe-guards are recommended:

    i) The cashier who receives cash physically should not be involved, in any way,

with the records relating to such cash transactions. The preparation of bank deposit slips, the banking of cash and the writing of the cash book and ledgers should be done by persons other than the receiving cashier.

ii) The cashier who receives cash should not be authorized to make any disbursements other than the refund of patients' deposits. The cash received should be deposited intact into the bank on the following day.

iii) All cash received should be first entered in a remittance book as soon as such cash is received.

iv) Inward mail should be opened by a person other than the receiving cashier or the person(s) responsible for writing up the ledger.

18) As regards cash disbursements, the following safeguards are recommended:

i) All cheques should have proper supporting documents duly authorized.

ii) When the cheque is prepared, the supporting documents should be stamped 'PAID', so that payment is not made more than once.

iii) All cheques should be signed by at least two responsible officers, who should also initial the cheque counterfoils.

iv) Cancelled cheques should be retained for the inspection by the auditors.

v) Cheques should be mailed directly to the payees in order to ensure that the payees and only the payees receive the disbursement.

vi) Only petty cash disbursements should be made in cash. All other disbursements should be made by cheque.

19) The office procedures should be so arranged that it should not be possible to defalcate cash without the collusion of two or more employees.

20) The record forms such as cash receipts, bank deposit slips, cheques and petty cash vouchers should be pre-numbered.

21) Bank statements, which serve as external evidence, should be reconciled every month with the Bank Book. Such reconciliation should be done by a person other than the cashier or the person responsible for writing the cash records.

22) In the cash receipts and payment journals, the totals of the vertical columns should be cross checked horizontally.

23) The balance appearing in the Patients' Account in the general ledger should be tallied with the total of the individual balances appearing in the accounts receivable ledger. Likewise, the balance appearing in the accounts, payable control account appearing in the general ledger should be tallied with the total of the individual balances appearing in the corresponding subsidiary ledger.

24) To exercise internal control for capital expenditures in hospitals, following safeguards are recommended:

i) Capital expenditure budgets should be prepared annually.

ii) Written authorization should be required for incurring capital expenditure. Such authority should be restricted to specified officials, whose authority limits should be clearly defined.

iii) Supplementary authorization should be required if the actual expenditure exceeds the sanctioned limits.

iv) The purchase and receipts of capital items should be subjected to the same procedure as are applicable in case of supplies.

v) Procedures should be established for the recording of movement of capital items from one location to another.

vi) The authority for the selling/scrapping of capital items should be restricted to specified officials, whose authority limits should be clearly defined.

vii) Detailed memorandum records in respect of fixed assets should be maintained.

viii) All fixed assets should be verified periodically. A written procedure should be laid down for this purpose.

ix) Care should be taken to ensure that all fixed assets are adequately insured.

x) Capital work undertaken by the hospital itself should be monitored by preparing "A Capital Expenditure Status Report".

25) The investment ledger should be reviewed periodically and a statement should be prepared to ensure that all investment income has been received on the due dates.

26) To properly manage the budget,

a) The hospitals' performance should be progressively monitored during the course of the budget year.

b) Continuous surveillance would enable management to

i) ensure that the actual expenditure is in accordance with the approved budget allocation.

ii) ensure that the actual expenditure is within the budget limits.

iii) take appropriate corrective action, if possible.

iv) use the residual budgeted funds with due economy.

4.8 LET US SUM UP

Rising costs are posing a constant challenge to hospital administrators. Hospitals being a service industry, the element of public accountability demands that the limited resources are utilized in the best possible way. Inspite of the fact that the value of human life cannot be measured in financial terms, the various operations of the hospitals cannot be planned in manner to maximize the use of available resources. To maximize the use of financial and other resources, requires creation of cost-consciousness, cost monitoring and cost management by the functionaries at all levels.

The chapter has focussed attention of the upcoming administrators to the basic tool of financial control that should be exercised during various operations in hospital management. The importance of certain important techniques like budget, financial statements, cost analysis, information system in finance and use of statistical reports and analysis to improve day to day performance have been discussed. A number of steps have been suggested to contain cost without sacrificing the quality of services. The integration of various tools and techniques is required to achieve the desired objectives as the emphasis on isolated activities is unlikely to yield any results.

Auditing as a tool of retrospective analysis of various financial transactions and procedures is essential to provide clues for future management of hospital activities. The basic philosophy of auditing rests with correcting the procedural errors and learn from our mistakes to ensure better forecasting, budgeting and performance of financial activities. The common audit objections raised in hospital functioning have been discussed to familiarize the students with the common types of errors in various financial operations and so as to take necessary corrective measures.

The issues related to financial transactions, proper use of assets, optimization of the use of available resources, inventory management, documentation of various activities, office procedures, internal controls for capital expenditures in hospitals, proper management of budget, etc. have dealt as do's and don'ts in financial control in hospitals.

4.9 KEY WORDS

Allocate : Used for accumulating information regarding a single asset, liability, owner's equity item, revenue and expense.

Accounting : An information system conveying financial information about a specific entity. or the process of identifying, measuring and communicating information to permit informed judgements and decisions by users of information.

Acid test ratio : Sum of cash, marketable securities, and receivables divided by current liabilities. Some non-liquid receivables may be excluded from the numerator. Sometimes it is called quick ratio.

Allocate : To spread a cost from one account to several accounts, products, activities, or to several periods.

Appropriation : In governmental accounting, an expenditure authorized for a specific amount, purpose and time.

Audit : Systematic inspection of accounting records involving analyses, tests and confirmations, accomplished in accordance with auditing standards.

Balance sheet : Statement of financial position which shows the assets, liabilities and owner's equity of an organisation.

Budget : A financial plan that is used to estimate the results of future operations. It is frequently used to help control future operations.

Budgetary control : The management of governmental or non-governmental unit in accordance with an official (approved) budget in order to keep total expenditures within authorized (planned) limits.

Cash budget : A schedule of expected cash receipts and disbursements.

Current ratio : Sum of current assets divided by a sum of current liabilities. Used as an indicator of solvency.

Endowment funds : Funds in which a donor has stipulated, as a condition of his gift, that the principal of the fund is to be maintained inviolate and in perpetuity and that only income from investments of the fund may be expended.

Equity ratio : Stockholder's equity divided by total assets.

Expense account : An account to accumulate expenses that is closed at the end of the accounting period.

Funds statement : An informal name often used for the statement of changes in financial position.

Internal audit : An audit conducted by employees to ascertain whether or not internal control procedures are working as opposed to an external audit conducted by specified authority.

Internal control : The procedures used by a business in attempting to ensure that operations are carried out or recorded as planned.

Inventory turnover : Number of times the average inventory has been sold during a period. Cost of goods sold for a period divided by average inventory for the period. Used to determine the effectiveness of inventory management.

Liquidity : A firm's cash position and its ability to meet obligations as they mature.

Operating expenses : Expenses incurred in accomplishing the ordinary activities of an organisation.

Playback period : Amount of time that must elapse before the cash inflows from a project equal the cash outflows.

Real accounts : Balance sheet account as opposed to nominal or income account.

Revolving fund : A fund whose amounts are continually expended and then replenished; for example, a petty cash fund.

Self-balancing : A set of records with equal debits and credits such as the balance sheet, and a fund in non-profit accounting.

Trial balance : A listing of account balances. All accounts with debit balances are totalled separately from accounts with credit balances. The two totals

Voucher : A document that recognises a liability and authorise the disbursement of cash.

Working capital : Current assets. It can also mean net working capital which is current assets minus current liabilities.

4.10 SELF ASSESSMENT QUESTIONS

1) Why is the controlling function important to the management of hospital functions?
2) What are the essential features of an accounting control function?
3) Enumerate the important tool of financial control.
4) How is budget a potent tool of financial control?
5) How does the balance sheet show the sources of resources of a firm?
6) What are the limitations of the use of balance sheet?
7) How are the financial ratios classified?
8) What is the difference between current ratio and acid test?
9) How do operating and cash budget differs?
10) How the departmental unit costing helps the management?
11) 'The key to the success in cost containment lies in cost awareness.' Discuss.
12) What steps will you take as a hospital administrator to reduce cost of various operations?
13) Define Audit. What are the advantages of audit?
14) Why should a hospital be subjected to audit?
15) What are the principle objectives of audit?
16) What are the limitations of audit?
17) What are the common audit objections raised in hospital operations?
18) Give instances of irregularities that are likely to occur in absence of proper internal checks in various transactions of hospitals.
19) What instructions would you like to issue as a hospital administrator to safeguard and maximize the use of various hospital assets?

UNIT 1 MARKETING OF HEALTH CARE SERVICES

Structure

1.0 OBJECTIVES

After studying this unit you should be able to:

- explain the term marketing and its scope;
- discuss the unique characteristics of services and their marketing implications;
- explain the concept of service quality and its application for health care services marketers; and
- understand the role of marketing communication for health care services.

1.1 INTRODUCTION

You might have some idea of what marketing is since as a consumer of different products you are definitely exposed to marketing in one way or another. So, what does the term 'marketing' mean to you? Is it selling or is it advertising? In fact, marketing is much more than just selling and advertising and covers a wide range of critical business activities that bring the products to the customers; the products they want, at the time they want them, at place they want them, at prices they can afford and also providing all the information the customers need to make informed and satisfying choices. You must be thinking "why should I study marketing?" or "what does study of marketing offer to me?" Well, as you would have noticed above, marketing includes activities which are vital to any organisation, including health care organisations. Most of you may not be working in the marketing department, but you must be in direct touch with the consumers (patients) at some point of time and thereby have an impact on the way the consumers judge the quality of services being received. This way you act as part time marketers. Therefore, regardless of specialisation or different responsibility areas a basic understanding of marketing is important for all of you. Even an HRD manager would be required to do some sort of marketing to attract best talent to the organisation.

In this unit we will first have a basic understanding of the 'marketing' function and its scope. Since services are different from goods, we will look into distinct characteristics of services which differentiate them from goods and their resulting marketing implications. The concept of service quality with specific reference to health care services will be discussed next. This is one area which is receiving widespread attention of

academicians as well as practitioners worldwide. Word of mouth communication is very important for health care services and thus we will also take up some issues related to it.

1.2 MARKETING : MEANING AND SCOPE

There is no single universally accepted definition of marketing. We are giving below a few widely accepted definitions of marketing which highlight the essence of the broad subject.

Marketing is the process of planning and executing the conception, pricing, promotion and distribution of ideas, goods and services to create exchanges that satisfy individual and or organisational goals. (America Marketing Association)

Marketing is the management process responsible for identifying, anticipating and satisfying customer's requirement profitably. (U.K. Chartered Institute of Marketing)

Marketing is a social and managerial process by which individuals and groups obtain what they need and want through creating offerings and exchanging products of value with others. (Philip Kotler)

Some of the common points emerging out of these definitions of marketing are:

- Marketing is a management process.
- Marketing is about giving customers what they want and includes identifying and anticipating customer requirements.
- Marketing offers and exchanges ideas, goods and services.
- Marketing involves pricing, promotion and distribution of ideas, goods and services.

Marketing activities include environmental scanning (demographic, technological, political, legal as well as socio-cultural environment), competitive analysis, finding customer needs and wants, and also deciding exactly which wants and whose wants the organisation is going to satisfy (segmentation and target market strategy), developing a marketing mix (the four P's–product, price, place and promotion) to satisfy the needs and wants of the selected target market, periodically evaluating the marketing efforts so as to bring about effective changes, if required. We will now take up some of these activities in details.

The Marketing Mix

Marketing is performed within a certain environment which itself is always changing. The marketing activities have, therefore, to change in consonance with environment to be continuously effective. In order to appreciate this process it is easier to divide the marketing activities into four basic elements which are together referred to as the marketing mix. The four basic elements are:

i) Product

ii) Price

iii) Promotion

iv) Place

As all these four start with letter 'P' they are, at times, referred to as the four Ps of the marketing mix or the 4Ps in marketing.

The word product stands for goods or services offered by the organisation. Once the needs are identified, it is necessary to plan the product and after that keep on analysing whether the product still satisfies the needs which were originally planned for, and if not, to determine the necessary changes.

Price refers to the money value that the customer has to pay. The product has to be adequately priced. This involves considerations to the profit margin, the cost, the possibility of sales at different prices and the concept of the right price. Pricing for

services require separate treatment than pricing for goods. We will take up the issue in details in the next unit.

Promotion is the aspect of selling and advertising, or communicating the benefits of the product or service, to the target customers or the market segment involved in order to persuade them to purchase such products or services.

It includes selling through advertising as well as the sales force. Besides, a certain amount of promotion is done through special seasonal discounts, competitions, special price reductions, etc., collectively called sales promotion.

Finally, place or distribution refers to the aspect of the channels of distribution through which the product has to move before it reaches the consumer. It also includes the logistics aspects of distribution such as warehousing, transportation, etc., needed for geographical distribution of the products.

It is also concerned with the selection of distribution channels. The organisation must decide whether it should sell through wholesaler (who buy in large quantities and sell to retailers) and then to retailers (i.e., the shopkeepers, who ultimately sell to the consumers), or whether directly to the consumers. There are many ways in which a product can be moved from the producer to the customer. The optimum method has to be determined in terms of both consumer satisfaction and profitability to the organisation, or optimum use of the organisation's resources.

Market Segmentation

Market segmentation refers to the process of dividing a market into meaningful, relatively similar and identifiable segments or groups. This helps in a better understanding of needs and wants of the customers and thereby fulfilling them in an effective way. Now-a-days, market segmentation plays a key role in marketing strategy of almost all successful organisations. The ideal segmentation strategy maximizes differences between segments and minimizes differences within each segment, in terms of criteria of interest. The most common segmentation techniques use demographic, geographic, psychographic, behavioural/utilization and benefit criteria. According to Engelberg and Neubrand (1997), "segmentation techniques are integral to an organisation's entire marketing process, from initial marketing research through marketing communication. Segmentation is a powerful way for marketers to understand who they are trying to reach, what is unique about each group, and how to design, distribute price, and promote offerings accordingly. It helps marketers make wise, cost effective choices. Health care marketers should understand and perform segmentation techniques particularly when financial resources are limited, competition is increasing and a health care organisation's clear direction is essential to ensure its profitability".

Activity 1

Identify possible bases for market segmentation of cardiac care services market.

1.3 DISTINCTIVE NATURE OF SERVICES MARKETING

The term service is rather general in concept and it includes a wide variety of services. They are widely used by people in practically all aspects of life. From education to entertainment, finance to fast food, market research to medical services, travel to telephone, advertising to amusement parks, retailing to recreation and so on, services now-a-days are increasingly being used by corporate as well as household sector. Before we discuss the distinctive nature of services let us first look at a couple of definitions of a 'service'. Kotler and Bloom defined service as "any activity or benefit that one party can offer to another that is essentially intangible and doesn't result in the ownership of anything. Its production may or may not be tied to a physical product". According to Gronroos "A service is an activity or series of activities of more or less intangible nature that normally, not necessarily, take place in interaction between the customer and service employees and/or physical resources or goods and/or systems of the service provider, which are provided as solution to customer problems".

Characteristics of Services

The above definitions highlight some of the special characteristics of services which are different from physical goods. For majority of services, four basic characteristics can be identified:

i) Intangibility

ii) Heterogeneity

iii) Inseparability of production and consumption

iv) Perishability

i) Intangibility

The most basic difference between goods and services cited universally is intangibility. Since services are performances and not objects, they cannot be seen, felt, tasted or touched in the same manner as we can do with physical goods. Consider for example a dental check-up, this cannot be actually seen or touched and can actually be experienced only. This is in contrast with, say, an automobile – a physical good – which can be seen, touched and physically checked. Intangibility of services is considered to be the critical distinction between goods and services. However, it must be noted that it is difficult to find a pure good or a pure service. Practically all physical goods have some element of service built into them and similarly all services have some tangible components. It is basically the relative dominance of intangibility in services as compared to dominance of tangibility in goods as shown in Fig. 1.1.

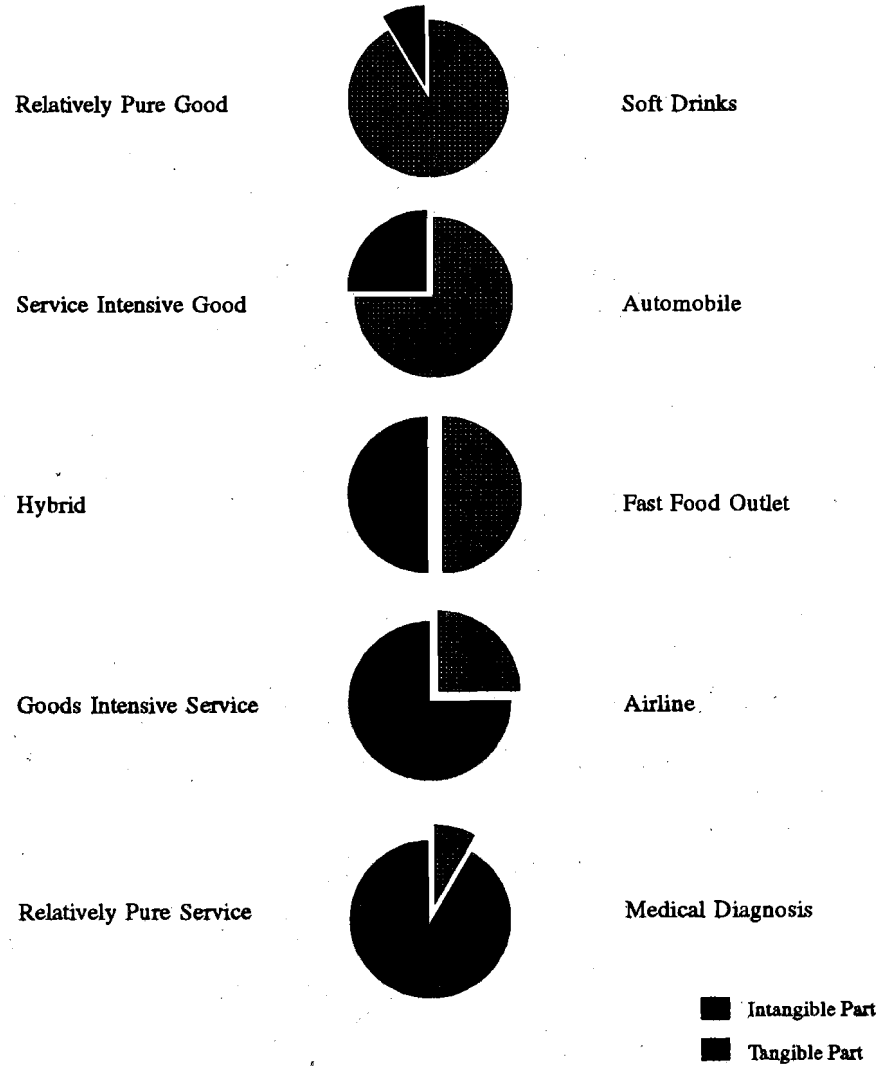

Fig. 1.1: Relative Tangibility Spectrum

As you would notice health care services are relatively intangible in nature.

The intangibility of services poses a number of marketing challenges:

- Services can't be stored and, therefore, it may become difficult to manage fluctuations in demand. For example, while demand for air coolers is more in summers, still it is possible to manufacture them in winter and keep them in store for selling later in summers. However demand for health care services which again is more in summers/ monsoons can't be managed that way.
- Since services can't be touched, felt, tasted or smelt, they can't be readily displayed or communicated to customers. Therefore, it becomes difficult for customers to evaluate a service prior to purchase. This makes the process of judgement of quality by consumer difficult, which in turn make the advertising and promotion strategies difficult to frame for the service provider.
- Prices are comparatively difficult to set for services because of its intangible nature. The actual costs of a unit of services are hard to find out and the relationship between price and quality is complex.

ii) **Heterogeneity**

Since services are performances produced mostly by humans, there is a strong possibility for high variation in these performances. The service delivered may vary from day to day, from producer to producer and from customer to customer. For example, a doctor may talk differently to different customers on a given day or differently to the same customer on separate days. Essentially, since number of factors affect human performances and that no two customers are the same gives rise to the heterogeneity factor.

Since the service delivered may vary from customer to customer, provider to provider and day-to-day, it becomes difficult to ensure consistent service quality. Further, the quality of services provided depends on many factors which cannot be fully controlled by the supplier, like the level of demand, ability of consumer to tell his requirements etc. Because of these factors service providers can't be sure that the services being delivered will match with what was planned and promoted. In a nutshell, heterogeneity makes standardization and quality control difficult to achieve.

iii) **Inseparability of Production and Consumption**

In case of services the production and consumption process overlap. While goods are first produced, then sold and consumed, most of the services are sold first and then produced and consumed simultaneously. The interaction between production and consumption may be broad or quickly passing. It may involve interaction between customer and service employee, or between customer and machine. The interaction is considered to be the essence of services marketing since generally it is during the interaction that customer makes a judgement on the level of service being received by him e.g. interaction between patient and doctor or patient and nursing staff.

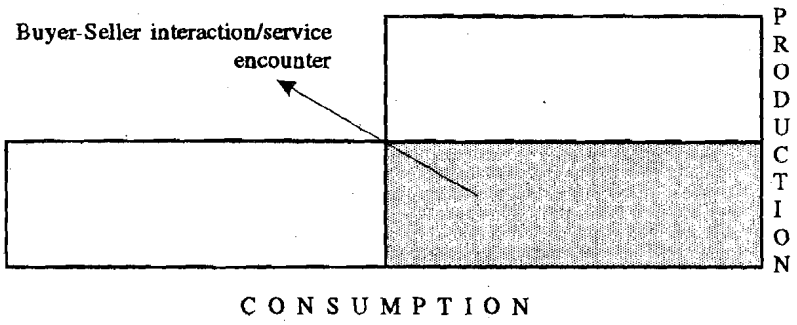

Fig. 1.2: Inseparability of Production and Consumption in Services

Because services are generally produced and consumed at the same time, it is not possible to have mass production. So it is not possible to have significant economies of scale. Because of simultaneous production and consumption, the customer is generally present in the 'service factory' and is involved in the production process. This may affect the outcome of the service process or transaction. Further a customer is not alone while receiving the service. This presence of other customers could have an impact on the type of service perceived to be received by a customer. Benoy (1996) highlights the

importance of this characteristic for health care managers, "They should define their services, not in broad, sweeping images of high-tech medicine and glossy newsletters, but in terms of dozens – perhaps, hundreds of specific encounters or events (e.g. admission, food quality, telephone enquiries, staff responsiveness, discharge etc.). Employees shape these moments of truth not only by the tasks they perform, but also by the way they look, act, talk and interact with the customers with other customers, and with fellow workers. Employee behaviour must, therefore, be carefully orchestrated and managed".

iv) **Perishability**

Perishability means that services cannot be stored, resold or returned. A hospital bed not occupied on a particular day cannot be used or resold at a later time. That opportunity is gone forever. This is in contrast to goods which can be stored or even returned.

The perishability of services poses a number of challenges:

- The major implication of this aspect is that services can't be stored. Therefore, aspects like demand forecasting, capacity utilization planning become important and difficult decision areas.
- Since services can't be returned or resold there is a greater need to have strong recovery strategies if the service goes wrong.

Table 1.1 gives a summary of the above mentioned marketing problems.

Table 1.1: Unique Service Features and Resulting Marketing Problems

Unique Service Features	Resulting Marketing Problems
Intangibility	• Services cannot be stored • Cannot protect services through patents • Cannot readily display or communicate services • Prices are difficult to set
Inseparability	• Consumer involved in production process • Other consumers involved in production • Centralized mass production of services difficult
Heterogeneity	• Standardization and quality control difficult to achieve
Perishability	• Services cannot be stored

Source: Zeithaml, Parasuraman and Berry, *"Problems and Strategies in Services Marketi* ", Journal of Marketing, Spring 85, p. 35.

A number of strategies to overcome these problems resulting from unique service characteristics have been developed and suggested over a period of time by a number of researchers. Table 1.2 gives a summary of these strategies.

Table 1.2: Marketing Strategies

Unique Services Features	Marketing Strategies
Intangibility	i) Increase service tangibility ii) Stress tangible cues iii) Simulate or stimulate word-of-mouth communication iv) Create strong organisational image v) Promote brand names

Unique Services Features	Marketing Strategies	
	vi)	Use cost accounting to set prices
	vii)	Engage in post purchase communications
	viii)	Manipulate the atmospherics
Inseparability	i)	Emphasise selection and training of public contact personnel
	ii)	Learning to work with larger groups
	iii)	Manage customers
	iv)	Train additional service providers
	v)	Use multi site locations
Heterogeneity	i)	Proper person selection and training
	ii)	Have systems for monitoring customer satisfaction
	iii)	Industrialize service through use of technology
	iv)	Customize service
Perishability	i)	Use strategies to cope with fluctuating demand like: • Differential pricing • Reservations systems • Consumer participation • Part time employees etc.
	ii)	Make simultaneous adjustments in demand and capacity to achieve a closer match between the two

Source: Zeithaml, Parasuraman and Berry, *"Problems and Strategies in Services Marketing"*, Journal of Marketing, Spring 1985, p. 37.

Activity 2

Take any particular health care service and find out how it differs from packaged goods marketing.

1.4 THE SERVICES MARKETING MIX

The unique characteristic of services make the traditional 4P marketing mix (discussed earlier in this unit) seem inadequate. Careful management of these 4Ps – Product, Price, Place and Promotion though essential, is not sufficient for successful marketing of services. Further, the strategies for the four Ps require some modifications while applying to services.

Since services are produced and consumed simultaneously, the contact personnel or the service delivery personnel become extremely important. It is during these encounters of service providers and customers i.e. the process on which a lot depends with regards to the final outcome as well as the overall perception of the service by the customer. The actual physical surroundings during these encounters have also a substantial bearing on the service delivery. All these facts lead to the development of an expanded marketing mix with three new P's added to the traditional mix. These are:

- People — All human actors who play a part in service delivery and thus influence the buyer's perceptions; namely, the firm's personnel, the customer, and other customers in the service environment.
- Physical Evidence — The environment in which the service is delivered and where the firm and customer interact, and any tangible components that facilitate performance or communication of the service.

- Process — The actual procedures, mechanisms and flow of activities by which the service is delivered – the service delivery and operating system.

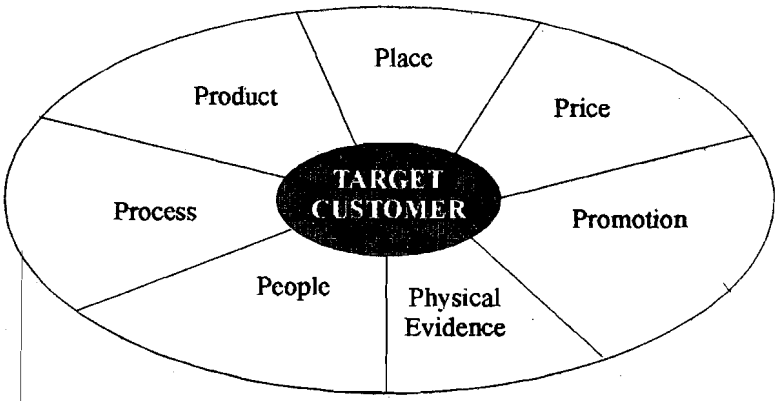

Fig. 1.3: Marketing Mix for Services

Because of the simultaneous production/delivery and consumption of services, the nature of marketing departments and marketing functions become quite different as compared to goods. The marketing function — all activities which influence the preferences of the consumers towards the offerings — is mainly handled by marketing departments in case of goods. Here as far as consumers are concerned, marketing departments (the organisational entity which is responsible for some, but not necessarily all marketing activities performed by the firm) can plan and implement most of the marketing activities i.e. the marketing department is able to control almost the total marketing function. In the service sector the situation is entirely different as indicated in Fig. 1.4.

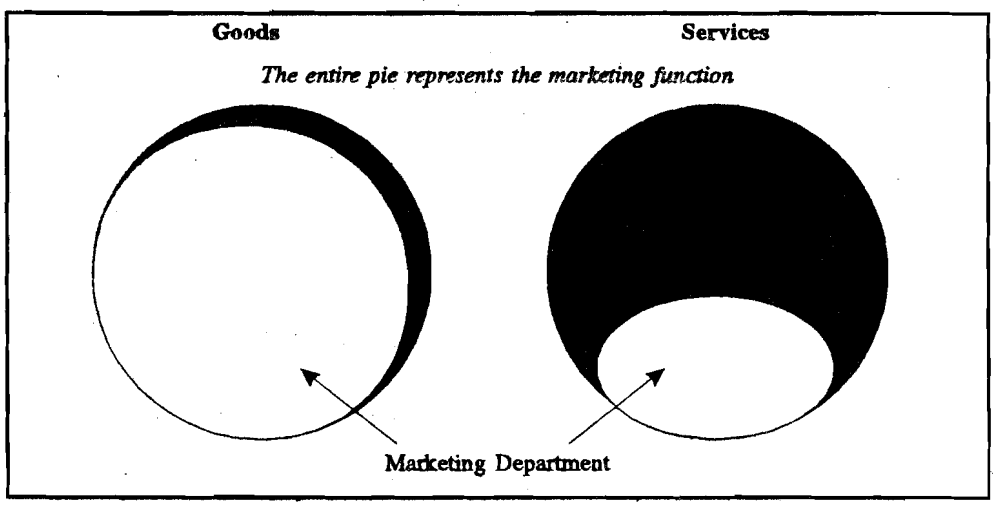

Fig. 1.4 : Relationship between Marketing Function and Marketing Department

Source: Chiristian Gronroos *"Designing a long range marketing strategy for services"* in Malcolm Donald (Ed.) *"Marketing Strategies : New Approaches, New Technologies"*, Pergamon, 1995, p-161.

A traditional marketing department in services can only control a minor part of the marketing function. Usually, it doesn't have the necessary authority to manage the buyer/seller interaction. The marketing department, therefore, cannot plan and implement activities pertaining to interactive marketing function.

Therefore, the marketing function, which is a key function in service sector require a special treatment. The total marketing in services include three different types of marketing as shown in Fig. 1.5.

As can be seen from the triangle, the traditional marketing mix and marketing department basically address to 'External Marketing' only. However, all three sides are critical to successful services marketing and the triangle can't be supported in the absence of any one of the sides.

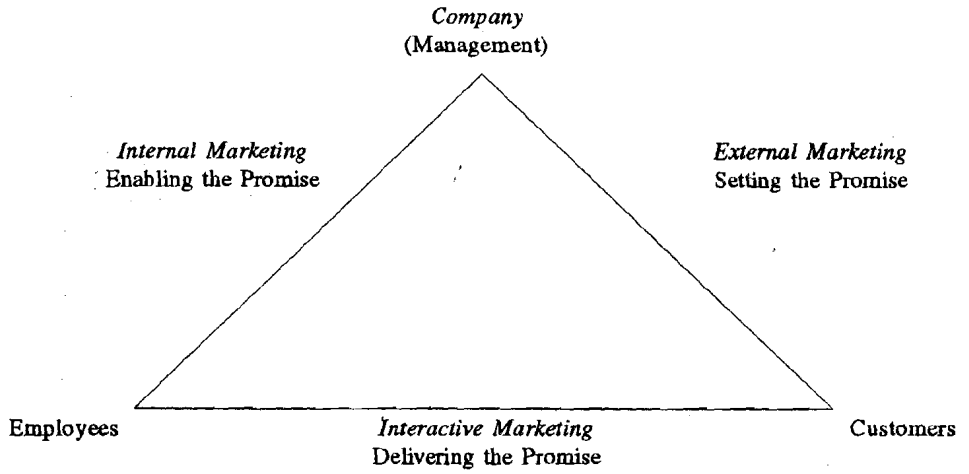

Fig. 1.5: The Services Marketing Triangle

1.5 SERVICE QUALITY

Quality came to the service literature only at the beginning of 1980's, which is quite in contrast to manufacturing sector wherein quality management has a long and rich history. However in 1990's quality has become an essential part of service marketing. The term 'Service Quality' has been defined in different ways by researchers, some of which are given below:

- Service quality is the delivery of excellent or superior service relative to customer expectations. (Zeithaml and Bitner, 1996)
- Quality of a service, as perceived by the customer is the result of a comparison between the expectation of the customer and his real-life experiences. (Gronroos, 1982)
- Service quality as perceived by customers, can be defined as the extent of discrepancy between customers', expectations or desires and their perceptions. (Zeithaml, Parasuraman, Berry, 1990)

As you will notice, all these definitions revolve around the fact that service quality is essentially what customers perceive. Only customers judge quality and all other judgements are irrelevant. However, 'Service Quality' as contrasted to goods quality requires a different approach because of some basic differences between goods and services with regards to how they are produced, consumed and evaluated.

- As you have studied earlier in this unit, services are predominantly intangible in nature. Since services are performances, acts and experiences, it is difficult to have exact specification for them unlike physical objects like television sets, automobiles etc. Further, services can't be tested prior to sale to determine its quality. That means services are low in 'search qualities' – attributes that a consumer can determine before purchasing a product, and stronger in 'experience qualities' – attributes that can only be assessed during consumption. Also there are certain services which consumer find difficult to evaluate even after purchase and consumption i.e. 'credence qualities'. Example of services high in credence quality would include medical diagnosis or an operation. Very few consumers would have sufficient medical knowledge or skills to evaluate whether such services are necessary and/or performed in a proper manner even after they have been prescribed and produced by the provider. Therefore, the criteria customers use to evaluate services is more complex thereby, increasingly the difficulties of marketers.
- Another very important aspect requiring separate treatment of services quality is the 'inseparability' aspect of services. As you have noticed earlier, inseparability of production and consumption in services reflect the more active part required from service providers as well as the consumer. It is in this interaction where usually the quality is judged is the consumer (refer to services marketing triangle – Fig. 1.5 – wherein one of the sides is interactive marketing). For example, even if the worker

on the shop floor who is producing a T.V. set may not be in a good mood but you as a consumer would never come to know about it. However, if a doctor is not in a good mood it may have a direct impact on the quality perception of the consumer of his services.

- Since services are 'heterogeneous' in nature, ensuring consistent service quality is a big challenge to service marketers.

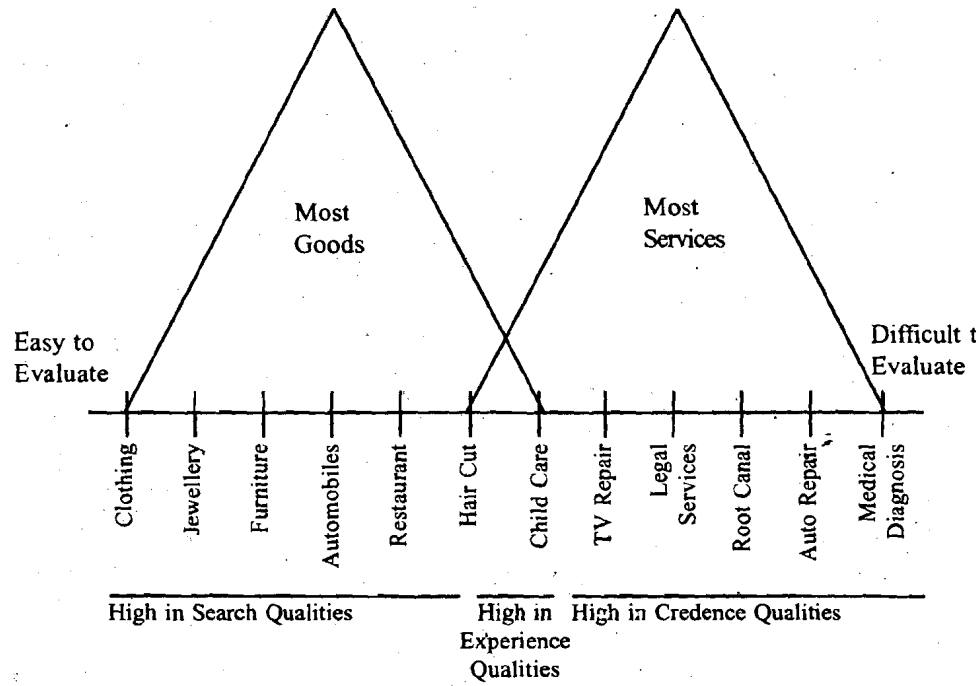

Fig. 1.6: Continuum of Evaluation for different Types of Products

(*Source*: Zeithaml, V.A., and Bitner, M.J. (1996) *"Service Marketing"*, McGraw Hill, p. 58)

Service Quality Dimensions

Gronroos (1990) suggests that the quality of service as it is perceived by consumer has two dimensions – a technical or outcome dimension and a functional or process related dimension. That means, the consumer judges the quality not only on the basis of what is being delivered but also how that outcome is delivered. For example for consumer of health care services the primary expectation is related to the response to the illness – 'cure'. The process of achieving this end is characterized by the delivery of service experience – 'care'. As we have discussed earlier that health care services are rich in credence qualities and, therefore, the technical outcome is difficult to evaluate, consumer would tend to make the assessment of the technically complex cure dimensions on the basis of the more familiar 'care' experience. Gabbott and Hogg (1996) suggest that evaluation of the clinical aspect of the service is particularly complex for individual patients but the impact of it upon overall satisfaction is unquestionable i.e. if the patient considers the medical response to have been inadequate, aspects of care can't compensate sufficiently to result in overall satisfaction. However, given the difficulties in adequately evaluating "cure" and the investment that a patient has in believing in the doctor's ability to treat illness, it is suggested that patients take this aspect of the service for granted and evaluate their service provision on the other aspects of service delivery.

Zeithaml, Parasuraman and Berry (1990) have done extensive work in the area of service quality and based on their research work have identified that customers consider five dimensions in their assessment of service quality.

Reliability : Ability to perform the promised service dependably and accurately (example – doctor keeps the appointment on schedule, diagnosis prove to be accurate).

Responsiveness : Willingness to help customers and provide prompt service (example – no waiting, doctor's willingness to listen).

Assurance : Employees' knowledge and courtesy and their ability to inspire trust and confidence (Example – reputation, credentials and skills).

Empathy : Caring individualized attention given to customers (Example – acknowledging patient as a person, remembers previous problems, patience).

Tangibles : Appearance of physical facilities, equipment, personnel and written materials (Example – waiting room, examination room, equipment, report cards).

Zeithami and Bitner (1996) suggest that since health care services involve some amount of uncertainty/high risk, assurance dimension would be of great importance to the consumers. In the early stages of relationship, the consumer may use tangible evidence to assess the assurance dimensions. Visible evidence of degree, honours and awards and special certifications may give new customer confidence in a professional service provider.

Poor service quality can be caused by a number of factors. These include organisation's lack of understanding of customers expectations; not selecting the right service design and standards; inability or unwillingness to meet the standards i.e. not delivering as per the service standards; not matching performance to promises. To provide quality services, an organisation should first learn about consumer expectations through market research. Even in the developed countries, in the not-too distant past, health care organisations had little first hand familiarity with marketing research. (Marketing Research is the objective and systematic process of gathering, analyzing and interpreting data relevant to a specific situation or problem facing an institution.) However, as hospitals increasingly have adopted a marketing orientation, they are choosing to use marketing research to help them understand marketing problems and opportunities. Loubean and Jantzen (1998) conducted a survey of 230 hospital executives in USA to assess the kind of marketing research activities being conducted by hospitals. Hospital's administrators reported that satisfaction surveys of both inpatients and outpatients are the most widely used research applications with more than 80% of the respondents reported usage of these two methods within the last year. Of the surveyed respondents 48% performed a competitive analysis of other institution within the last year and 78% performed this analysis within the last three years. The researchers go on to suggest that 'hospitals seeking effective marketing strategies need to recognize that a broad array of marketing research information is available to them. Research is not inexpensive, but it can be one of the hospital's best values because, if done properly, it leads to better decision making. Hospitals should develop and fund annual research activities'.

Activity 3

Talk to different consumers of health care services and determine the relative importance of the five service quality dimensions (discussed in the section) as perceived by them.

Internal Marketing and Service Quality

As you would have noticed earlier in the services marketing triangle that internal marketing plays a critical role in services marketing. It enables the employees to keep the promises that have been made to customers. Internal marketing can be viewed as the building of customer orientation among employees by training and motivating both customer-contact and support staff to work as a team. The role of employees in a service organisation is very dramatically highlighted by Hal Rosenbluth (1992), owner of a chain of successful travel agencies, in his book titled "The Customer Comes Second" wherein he argues that a company's first focus should be on its employees. "Only when people know what it feels like to be first in someone else's eyes can they sincerely share that feeling with them" (p. 25). Similarly Benoy (1996) mentions that for service business such as health care that are labour-intensive and demand high levels of personal contact between the service provider and the customer, no marketing plan can be considered complete unless it includes strategies for reaching and winning over its internal customers. He further goes on to define internal marketing as "the application of marketing, human resources management and allied theories, techniques and principles to motivate, mobilize, co-opt and manage employees at all levels of the organisation to continuously improve the way they serve external customers and each other. Effective internal marketing responds to employee needs as it advances the organisation's missions and goals". The activities involved in internal marketing include competing for the talent, training employees, empowerment, knowing employee needs, good internal

communication, measuring and rewarding quality. You will study more about some of these aspects in the section on Human Resources Management.

> Knowledge is empowering. When customers and visitors ask, the employees know what is going on and why. They feel they are the hospital, rather than answering. "They tell me nothing!" If you don't tell them, if they don't know, then distorted rumours start circulating. Worse yet, they fell excluded and not a true part of the hospital. Employees, in general, are well motivated and want to do well. Further more, no one knows the job better than individual employees themselves. Therefore, if you create an environment in which they feel comfortable enough, knowledgeable enough, about the business to feel that they own the business in a sense, they will contribute – providing, of course, that their capacity to contribute is enhanced by a responsive upper structure of the organisation. (Rabkin and Avakian, 1991)

1.6 MARKETING COMMUNICATION FOR HEALTH CARE SERVICES

As we have discussed in the beginning of this unit, communication is an essential part of marketing. In fact it is one of the elements of marketing mix i.e., promotion. Few goods or services, despite being well developed, priced and distributed can sustain the market place without effective promotion. Promotion can broadly be understood as "communication by marketers that informs, persuades and reminds potential buyers of a product to influence an opinion or elicit a response". The various elements of promotional mix are advertising, sales promotion, public relations and personal selling.

However, in this section we are going to focus on word of mouth communication, since in case of services, especially services which involve some amount of uncertainty or risk (like health services), consumers tend to rely more on information from personal sources (e.g. friends) than from non-personal sources (e.g. mass media). Therefore, word of mouth (w.o.m.) communication becomes a critical part of health care marketing. Before moving further let us study a definition of w.o.m. communication. It may be defined as "Oral, person-to-person communication between a receiver and communicator whom the receiver perceives as non commercial regarding a brand, a product or a service". Though not under the direct control of marketer, they can still influence it. A health care marketer might ask how favourable word of mouth can be prompted, unfavourable word of mouth reduced – and since either effort will likely require marketing expenditures, what results can be expected. Besty and Madeline (1995) have highlighted a number of issues regarding w.o.m. communication in health care marketing:

i) Word of mouth is more effective than advertising. And in the health care field, the difference is even more striking than in other purchase categories.

ii) The effectiveness of word of mouth applies across the board in terms of the kinds of responses marketers traditionally seek. Word of mouth communication not only increases awareness and knowledge, but it also persuades and lead to action, such as actually choosing the provider one has heard about.

iii) Favourable w.o.m. communication can't overcome personal negative experience.

iv) Health care organisations should encourage its employees, their spouses to become involved in community and neighborhood groups and to educate them on what to say when they get there, in the hope that a source of word of mouth communication is listening.

v) Word of mouth increases as the level of satisfaction increases. An emotionally positive experience with a health care provider increases w.o.m. and satisfaction which in turn, raises the odds that w.o.m. will be positive. A marketer, therefore, has an opportunity to enhance experience that leads to positive w.o.m. So, health care marketers should seek a mandate to provide emotional highs to the patients and prevent strong emotional negatives, even if these goals involve serious trade-off.

vi) Consumers of medical care are more likely to engage in negative w.o.m. than they are to complain to their health care provider. Health care providers, therefore, must

make a greater effort than marketers in other industries to make complaining easy and acceptable.

Activity 4

Find out the information acquisition activities undertaken by consumers for selecting a health care provider.

Advertising

Though advertising is not being used substantially by hospitals in India, it can be a significant means of communication to the customer. Clow (1995) suggests that by incorporating the five dimensions of service quality (discussed earlier in this unit) – assurance, reliability, empathy, responsiveness and tangibles into their advertising, health care providers can increase the level of perceived quality and thereby reducing the perceived risk. To be effective, health care advertisements must contain one or more of these dimensions in the form of headlines, copy or captions. Pictures and drawings can also be used. To prevent clutter and confusion, an advertisement should focus on only one or two clues; more can be used by cycling several advertisements.

1.7 LET US SUM UP

Marketing, broadly can be viewed as business activity that brings the products to the customers – the products they want, at the time they want them, at place they want them, at price they can afford and also providing all the information customer needs to make informed and satisfying choices. Regardless of specialization or different responsibilities all health care services providers need a basic understanding of marketing. The term service includes a wide range of services including health care services. Services marketing require a different treatment as compared to goods marketing because of the distinctive characteristics of services. These include, intangibility, heterogeneity, inseparability of production and consumption and perishability. Because of these characteristics, the traditional 4 P marketing mix is inadequate and services marketing entails an extended 7 P marketing mix which includes Product, Price, Place, Promotion, People, Process and Physical evidence. The aim of service marketers should be to present a unique blend of these seven marketing mix elements in order to deliver excellent or superior service relative to customer expectation. For health care marketers, this could include not just taking care of the 'cure' (outcome aspect) but also the 'care' aspect (process). For achieving this, internal marketing is of crucial importance. Further for health care services, which involve some amount of uncertainty or risk from customers' point of view, word of mouth communication plays an important role.

1.8 KEY WORDS

Internal marketing : Application of marketing, human resource management and allied theories, techniques, and principles to motivate, mobilize, co-opt and manage employees at all levels of the organisation to continuously improve the way they service external customers and each other.

Marketing : The process of planning and executing the conception, pricing, promotion and distribution of ideas, goods and services to create exchanges that satisfy individual and or organisation goals.

Market segmentation : Process of dividing a market into meaningful, relatively similar and identifiable segments or groups.

Service : An activity or series of activities of more or less intangible nature that normally, not necessarily, take place in interaction between the customer and service employees and/or physical resources

or goods and/or systems of the service provider, which are provided as solutions to customer problems.

Service quality : Service quality is the delivery of excellent or superior service relative to customer expectations.

Word of mouth communication : Oral, person-to-person communication between a receiver and a communicator whom the receiver perceives as non-commercial regarding a brand, a product or a service.

1.9 SELF ASSESSMENT QUESTIONS

1) What do you understand by the term marketing? How is marketing relevant to health care organisations?

2) Identify the four main distinguishing characteristics of services. What are their implications for marketers?

3) What are the components of service quality? How would you apply these to health care services?

4) Discuss the importance of word of mouth communication for health care services?

UNIT 2 PRICING OF HEALTH SERVICES

Structure

2.0 OBJECTIVES

After going through this unit you should be able to:

- discuss the concepts underlying price setting;
- explain the relationship between costs and prices;
- define the various objectives that may be sought while deciding the prices of your service;

- explain the various methods of pricing;
- select a price appropriate for your own health services; and
- apply the understanding of consumer perception of prices to your pricing decisions.

2.1 INTRODUCTION

Pricing is one of the most important decisions that you as a provider of health services will have to take. The sheer variety of available price levels for similar services among different providers of medical and health services is indicative of the differential practices that are being used to arrive at the ultimate price for various services. We in this unit shall discuss the conceptual basis of price setting, the different objectives that may be sought in price setting and the various bases that different establishments apply to arrive at the final price. The discussion also includes some of the operational issues that need to be considered in relation to administering your pricing policy. This unit presumes that you have already gone through and understood the break even analysis explaining costing of health services, as we will use the concept of costs in terms of their relationship to prices. This unit also briefly discusses why pricing for services like medical services is different from pricing of tangible products. One of the key determinates in any pricing decision is the consumers perception of the value he gets as a result of availing a particular treatment. As consumers evaluate prices in a different way for services that they do for products, it creates both opportunities and problems for providers of health services. These issues are discussed at length in this unit.

2.2 PRICING — THE BASIC FOUNDATIONS

All medical service establishments, except the public ones, are dependent on revenues from patients as a significant and sometimes the only source of their incomes. These incomes are a function of the prices they charge for their services and the number of customers who avail these services. Interestingly however, for routine and standardised medical services like a health checkup or vaccination or a tooth extraction, the price charges would often determine how many customers would avail the service in a given establishment. In order to understand price determination fully, you must be aware of the basic fundamentals of price setting, specially in the context of hospitals as providers of medical services.

The pricing strategy for any given service, medical services included, depends on three basic fundamentals. These are ***costs, value*** and ***competition***. The costs represent the monetary value of everything that the organisation has to utilize in order to create and offer the service for the patients. In the short run or the long run, all costs must be recovered if the organisation is to earn profits. Costs thus represent the lowest limit below which in the long run, prices cannot be set. On the other hand, you cannot set the price, beyond the value that your customers assign to the service, simply because at that price level, exchanges (or purchase of service) will not take place. Consumer's perception of value of a given service would thus set the upper limit beyond which prices cannot be set. Between these two limits service organisations may have the freedom to charge whatever prices they determine, but for the presence of a third variable, the competition. You are not the only provider of health services in the market. There may be several other providers with similar or better services. The prices that your competitors charge for a similar service will limit your freedom of setting prices between the two limits provided by the costs and the consumer's concepts of value. The prices being charged by the competition would thus determine the actual level at which prices for a given treatment or service may finally be set in between these two limits. To recapitulate the three basic variables that are fundamental to any pricing decision are:

- how does my consumer define value for a given service.
- what are my costs in providing that service.
- how does my competitor price the same service.

We shall in the next paragraphs try to understand why the pricing of health services has to be dealt differently as compared to pricing of products.

Activity 1

Identify any basic hospital service like an X-ray analysis, a complete health check examination or a medical consultation for suspected typhoid in three medical establishments in your city. Do you find any price variations? What in your view are the reasons for these variations?

2.3 WHY IS PRICING FOR MEDICAL/HOSPITAL SERVICES DIFFERENT FROM PRICING FOR GOODS

In order to realistically set your prices, you should be able to have an appreciation of what role does price play in the customers' decisions to avail a given medical service or health plan. Health providers must, therefore, have a clear idea about how their prospective client population perceive prices and price changes of various medical services offered by them. The three basic ways, in which pricing for hospital/clinical/medical services differ from pricing for goods are the issue of customer's knowledge of prices, the role of prices in indicating quality of services and the issue of non-monetary costs.

2.3.1 Prices of Hospital Services and Customer Knowledge

How important is price to the customer when he/she tries to select a particular hospital/ practitioner for a particular treatment? Do customers have any idea at all about the costs associated with such services? Do customers really have clear awareness about the exact prices they would be required to pay for a given treatment before they decide to avail of a given treatment? Let us briefly look at these issues and their implication for pricing of health services. To take a simple exercise, ask adult people around you a few questions about health services and their prices. For example, what is the price for a medical checkup in your city? What is the price for a service like a root canal operation, or a simple tooth extraction? What is the price one is likely to pay for a bone setting process after a fracture and so on. You will find that few people will be able to answer accurately on the basis of their memory alone, because clear ideas about such prices are not available. The price point in our memory for a product or service is called the 'reference price' for that product or service. Very few prospective patients have a clear reference price for the range of health services provided by hospitals and clinics. Let us examine some of the reasons for this phenomenon.

Health services are intangible, and can be offered in a variety of configurations with variation in accompanying services. Hospitals, therefore, are able to create a number of permutations and combination of a given treatment package, resulting in complex pricing structures. If a prospective customer wanted to have comparative assessments of prices for a Ceaserian section, she/he would find that the type of package varies (length of stay, associated services provided), patient particulars may vary and necessitate price variation (complexities, age, medical condition), the level of services may vary (single vs. double room, patient to nurse ratio etc.) Few hospitals would offer exactly the same features or package of services. Prices are, therefore, not strictly comparable.

The problem becomes compounded on account of the fact that in quite a few cases medical providers may be unable to give an accurate price figure in advance as they may not, at the very outset know what a given treatment would ultimately involve. In case of health services, customer's individuals needs also result in different prices being charged. Previous history, general medical condition, age, related health complications etc. may often determine the course of action that would need to be taken for a given patient, final prices, therefore, may also be a function of individual needs of different patients.

It is also comparatively difficult to gather accurate pricing information of all comparable hospitals, because unlike retail outlets displaying prices on their merchandise, prices of health services are not really displayed except for routine services and consultation charges.

It must now be clear to you that prospective customers often possess inaccurate information about prices of health services. The implication of the fact for your pricing

by finding some ways of communicating prices at least for all routine services; creating of price visibility is an issue that many hospitals consider seriously.

The second implication is that while the customer may not 'know' the final price until after he has been in the service transaction for some time for his initial treatment, prices become an important criterion for repurchase of the service as the customers' knowledge of the service costs has now become more accurate.

2.3.2 Prices and Quality of Health Services

One of the interesting things about service prices is that because other cues to quality of service are seldom available, customers tend to use prices as indicators of service quality. In case of goods, the tangible nature of the product and the possibility of physical examination by touching smelling feeling enables a customer to have an assessment of the quality of the product before he buys it. In case of services which are intangible, such pre-purchase assessment is difficult. Research shows that in case of most service, because other tangible indications to assess quality are not available consumers use physical evidence and price as surrogate indicators of service quality. Wherever pre-purchase assessment of quality is not easily assessable high prices in the consumer mind get associated with high perceived quality. Medical services are among the services which are high on credence qualities, where evaluation of service quality even after experiencing a given service (for example a by pass surgery) is difficult to make. In such situation consumers depend on prices as a cue to quality. Prices for medical services, therefore, must be determined keeping in mind the fact that price and quality for such services are positively associated. In addition to cost coverage and/or meeting the competition, prices must be set to convey an appropriate and desired quality image.

2.3.3 Costs other than the Monetary Cost

There is an increasing realisation on part of service providers that apart from the monetary cost, customers have to bear several non monetary costs also while availing a given service. Sometimes these costs affect consumer valuation and affect his choice of alternative service offers. These costs include time costs, search costs and psychic costs.

Health services require direct participation of the patient and thus require him to spend both waiting time and interaction time with the hospital subsystems — registration, specific tests and of course the doctors. For any given appointment his time spent may comprise both waiting time and time with the doctor. Time spent in availing a given service represents a specific cost to the customer. Some health services, specially the costlier ones like a by pass surgery require the customers to go through a lot of information search to identify the best possible alternative offers are comparable, one variable may include apart from the prices, the expertise of the doctors, facilities offered, location etc., such costs are sometimes considerable and also have to be borne by the customer. Sensor costs are the other class of costs that may make a difference. Unpleasant sounds, noise, crowds are some of the sensations that most people are uncomfortable with. In hospitals that are located in crowded or squalid neighbourhoods, or are overcrowded customers may have to bear these costs. If there are alternatives which are compenable on other variables mentioned earlier, customer may like to avoid the sensory costs, even if they have to pay a little higher.

For health services, one of the most potent costs are the psychic costs – not understanding the service feat of uncertainty, feat of undesirable consequences like pain, disability or loss of control are very important in the customer's decision to avail or postpone a given medical transition. Providers of health services, therefore, must be aware of not only the monetary costs like cost of time, cost of search, sensory and psyche costs because there costs offset consumer valuation significantly and should this be an input in pricing consideration.

Activity 2

hospital they chose. From the former, try to find out, why in spite of high price, was their choice made in favour of this hospital. How does their answer reflect the concepts studied above?

2.4 ROLE OF PRICES AND CONSUMER VALUE

Exchanges of goods and services take place when the buyer of a given service feels that the goods or services being bought by him are at least as valuable to him as the money he is spending in buying those goods and services. The case of health and medical services is however slightly different. As there are many instances under which the customer's need for a given treatment or check up is a non postponable or emergency purchase and often a necessity, the exchange will take place even if prices are not suitable to the customer. He will however, if competitive offers are available, try to find the best possible return for his money. The return again is dependent upon how a given customer defines value that he gets in a given transaction.

Different consumers may perceive value differently. To some value may meet low price, others may perceive value in terms of associated service, comfort, speedy disposal, and privacy.

The implication of the concept of net value for pricing decision is that, while evaluating whether a given price is right for a given medical service, the customer may look at all the perceived benefits that he would receive as a result of the service transaction. He would also analyse the costs that he has to bear in order to avail the service. The higher the difference between the sum total of perceived costs and the sum total of perceived benefits greater will be the net value of the service in the eyes of the customer. You can imagine a balancing act being carried out in the customer's mind while he tries to offset the perceived benefits of the service against the perceived total cost. If the perceived costs are found to be higher than the total perceived benefits, the transaction will be looked upon as having net negative value and, therefore, not desirable at that particular price. Of interest to marketers is the fact that the evaluation of net value can be changed either by increasing the perceived benefits to the consumer or minimising perceived costs or managing both. The net benefits apart from the core benefit of health added could include value to the health service in terms of personalised care, individual attention, higher quality of medical personnel, high success rates, ensured privacy, exclusivity of service, corporate health plans enabling speedier medical reimbursement, installment payment plans, accepting payment through credit cards or cheques etc. Perception of net value can be increased by giving some of these additional benefits. Reducing the costs side may not necessarily mean cutting only the monetary costs. Perceived costs of availing the service by the customer could also be reduced by:

- reducing waiting time, reducing the time taken in giving test reports, ensuring all appointments are meticulously managed and kept.
- reducing the information search costs by providing required information readily and easily.
- facilitating access to services like facilities, accounts and amenities.
- reducing unnecessary physical effort that customers may be required to make to avail the facilities and services.
- reducing levels of stress associated with a given treatment through information sharing, consultation and counselling.
- minimising sensory costs like noise, unwelcome sights and smells, offensive behaviour of support staff and so on through creation of attractive, pleasant visual atmosphere, noise reduction and training of personnel.

Reduction in these costs, will enable the customer to perceive higher 'net value' in the service. It can also enable the provider to enhance the monetary price charged or have greater pricing freedom because he is now able to manage a higher net perceive value in the consumer's mind.

Perception of value are important in marketing of health services because buying decisions do not get made on reality but on perception of reality. The fact that prices are perceived to be high or reasonable by the customers is thus dependent upon whether they perceive the price as being commensurate with the value that they receive.

The providers of services in health care must also be sensitive to the fact that customer's evaluation of 'net value' may vary sharply pre and post utilisation of the service. As health care is a service where repeat use by the same customer or members of his family is a frequent possibility, post purchase evaluation may have important implications for repurchase of services when customers find that costs of a given stay in the hospital in terms of monetary or some of the costs described above, were higher than what they anticipated at the time of making the buying decision or that the anticipated benefits were not received fully, their evaluation of net value may go down sharply and may result in absence of repurchase as well as loud word of month publicity for the hospital. Prices, therefore, have to be reflective on the perceived net value in terms of giving the consumer a positive figure on the balance of net perceived benefits and net perceived costs.

Activity 3

You have just studied about some relevant costs other than the monetary costs. Take a survey of at least five medical establishments and report how efforts have been made to reduce some of these costs. What additional recommendations would you made to these providers for minimising the cost side (monetary costs not included) of their price and price cost value equation.

2.5 PRICE SETTING IN PRACTICE AND PRICING OBJECTIVES

Under this section let us look at the various pricing objectives that health service establishments may seek when they determined their prices and then identify the various bases that are applied by them to arrive at a final price.

2.5.1 Pricing Objectives

Fundamental to any decision on pricing is your understanding of your pricing objectives or simply put answering the questions "what do I want my prices to do for me/my organisation". In the basic objective maximising your profit, or maximizing patronage or sheer survival at a given point of time? Understanding pricing objectives will help you appreciate the outcomes that you want your prices to achieve and this would direct your price setting efforts. Pricing objectives may be revenue oriented, operations oriented and patronage oriented. The approaches that can be used to arrive at the final price are costs based pricing, competition based pricing and demand based pricing. Let us discuss these in the following paragraphs.

2.5.2 Revenue Oriented Pricing Objectives

Revenues represent the surplus of income over your costs. Health establishment in the private domain, if they are established as profit seeking organisation, will seek to keep their prices at levels that will enable them to earn the greatest possible surplus on their costs. Even in the public domain, health establishment cannot afford to overlook the revenues or at least consider carefully that prices are set at levels that enable the revenues

to at least cover the costs if not generate profits. The various revenue oriented objectives that may be sought by health services provider may include:

- maximising the surplus or revenues.
- achieving a certain target rate of return on your investments.
- cover all costs.
- cover cost of providing one particular services.
- cover incremental costs of offering a given service.

Apart from these revenue oriented objectives you may sometimes come across two other classes of objectives which are usually applied in cases of new or innovative services. These objectives are:

2.5.3 Market Skimming Objectives

When a new or innovative health service is introduced in the market, for example, a new diagnostic test (ultrasound test, MRI Scans, are good example of this technique of pricing) the providers on account of the fact that there are only few providers who can offer the services try to charge an initial high price so that the initial return can be very high. This enables them to encash their near monopoly position at the initial stages of the service being introduced in the market. Market skimming as an objective is generally followed when the expectation is that competition for this new service will soon emerge in the form of other providers. Starting to offer the same service when competition starts emerging prices are brought down to a more reasonable level, allowing the organisation to still earn profits but not at the introductory levels.

2.5.4 Market Penetration Objectives

Alternatively when an innovative service with a high market potential is introduced in the market, but customers resistance to the service on account of its novelty is also high, a low initial price is sought to be charged, to enable the potential customers to try the services and be convinced of its value. This is called the market penetration objectives as it enables the organisation to gain entry in a market and then develop its market overtime. As larger number of customers, realising the value of the service start demanding the service, the prices are gradually raised to enable the earning of a targeted rate of return.

2.5.5 Operations Oriented Pricing Objectives

This objective is usually applied in case of service organisation where there are large differences in volume of demand at different times, so that the situation of under utilisation of capacity and overfull demand may alternatively be confronted by the organisation depending upon the seasonality of demand. The prices, therefore, are sought to be set in a way that allows price variation over time so that demand matches available supply at any given point of time. Special weekend packages in developed contracts pricing are an example where low prices on weekends are used to off set the low hospitals bed occupancy weekend. Hospitals in our country on the other hand are severely supply constrained organisations where demand for hospital services far outships the available supply. Operations oriented objectives are thus rarely applied except in cases where specific full equipment utilisation is sought to be achieved through such practices.

2.5.6 Patronage Oriented Pricing Objectives

Hospitals like all customer based organisations are dependent for their growth on the number of customers who choose to patronise them. Health providers may, therefore, sometimes, deliberately seek to set prices at levels which are directed at enhancing patronage rather than being based purely on costs or revenues. These objectives may be:

- subject to a certain level of revenue, try to maximise patronage if capacity is not a barrier.

- identify that different segments in your market have different paying capacities and create pricing structures that will enable patronage from different segments.
- identify that alternative strategies like paying through credit cards or organisational billing may actually enhance customers willingness to patronise your establishment.

This description of the various pricing objectives that may be sought by hospitals health service providers is not exhaustive. Other objectives that may be sought to be achieved through pricing can include survival market development, maximisation of current revenue, maximisation of market skimming overcoming customer resistance to trial of a given service achieving a quality leadership etc. The organisation should however have a clear focus on what objectives are sought to be pursued through the pricing decision to enable a clear definition of what bases would be used to arrive at a pricing figure. We shall now discuss the pricing methods using the various bases i.e. cost, competition and demand.

Activity 4

Identify, from among the practices followed in your city or in your knowledge, examples of the following:

a) Market Skimming Objectives

b) Market Penetration Objectives

2.6 BASES USED IN PRICING

2.6.1 Cost Based Pricing

Generally used as a pricing basis for revenue oriented pricing objectives cost based pricing methods are among the most prevalent methods of pricing in a large number of organisation. The reasons are simple. You often feel that there is less uncertainty about costs than about factors like demand or consumer evaluation of value, costs are internal data and may be more controllable. In the cost based pricing approach, hospitals will be required to determine expenses accruing on account of raw material, labour, human resources and machinery; add amounts or percentage for overheads and then add the margin for profit thereby arriving at the price. Price would thus be a sum of direct costs plus overhead costs plus the profit margin desired to be earned on investment. This however looks much easier than it is. Let us look at the various costs that you would need to estimate before you arrive at the inputs for this pricing equation. (You have already been exposed to the basic costs concepts in Unit 1, Block of this Course).

Fixed costs are those that do not vary with the volume of operation, and continue to be incurred if the health services are not being offered. These include costs like rent of the building, insurance, taxes, depreciation, administrative salaries, salaries of the full time medical and nursing staff, utilities like water and electricity, security, cost of capital invested, maintenance costs etc.

Variable costs are those that vary with the level of output (or operation in this case) and are thus dependent upon the number of patients served by the hospital. This would include costs involved in calling in consultants for a specific patient, costs of test conducts, wages and salaries incurred in paying overtime for additional manpower required costs of medical supplies etc. Conceptually, the organisation must be able to calculate its total cost per service transaction by adding up the variable costs component per service and the proportion of unit fixed costs allocated to that services and add to this total unit cost, the margin that is desired to be earned to arrive at the price figure for that service. In the long run every organisation must operate at a price level which allowed it to earn a certain margin after covering both fixed and variable costs.

You have already learnt in the unit on break even analysis and how break even point can enable identification of both the level of operation and the safety level at which the organisation should operate. The difference between the final price and the variable costs, called the contribution margin is indicative of the amount that is available with the organisation to cover its fixed costs and if possible to earn a margin of profit. Since

information about costs is the basic input in arriving at a pricing decision, this approach is referred to as cost based pricing.

There are however several problems associated with purely cost based pricing approaches, specially in case of hospitals where multiple services are being provided. The main difficulty arises in allocation of costs. It is for example very difficult to decide what proportion of costs of land and building should be allocated to outpatient services or the surgical services? What should be the basis of allocation — should it be the proportion of space occupied or should the cost be equally allocated to all services. How should the salary of administrative staff be charged to per unit service transaction? These are difficult issues and required either a simple overall overhead calculation which is their equally allocated to all services (which would be arbitrary) or detained costing exercises which may prove to be extremely time consuming. The second major problem is that a large proportion of cost is composed of cost of people (both doctors and administrative personnel) which is, very difficult to allocate on a per unit basis. There are also interesting variations in the type of work that gets created in a hospital which has implication for costing and pricing. While an X-ray charge may be based on fixed and variable costs related to the X-ray machine and the machine operator, how does one really costs the time or the expertise of the professionals who has to interpret the film and prepare a diagnosis? How does the costing really get done if the diagnosis is a team effort or consultative process? These issues sometimes render cost based pricing a non realistic exercise and estimation instead of actual figures start getting applied. Yet on the basis of historical data and analysis of costs incurred in the past period, health providers use cost based pricing extensively. Two variations of the cost based pricing technique are generally used. The first is based on deciding about a markup on costs of offering the service and then charging a final price based on total cost + markups. Hospitals also tend to vary markups within the same establishment. Markups may vary inversely with the volume of services sold, the higher volume the service the lower the markup, for example paediatric vaccination. The lower the frequency of service the higher may be the markup. Others may vary the markup on the basis of industry practice; still others may follow a practice of fixed markup like 20-30 % across the services.

The second cost based pricing technique is based on earning a targeted rate of return on investments wherein the organisation bases its pricing decision on identifying a certain percentage rate of return that is desired to be earned on the total investment made. The total revenue that must be earned on the investment is thus calculated and the proportionate allocation is then done across services to enable the actual total revenues as per the desired rate of return.

2.6.2 Competition Based Pricing

The approach here is to base the pricing decision on the prices charged by other comparable providers. As noted earlier, service providers in the health sector may not be strictly comparable. Yet for routinely bought services like periodic health check, dental cleaning, tooth extraction, X-rays, diagnostic tests etc. consumer knowledge of competitive prices is higher and the possibility of varying prices very much from the going rate is not very high. The higher the degree of standardisation in certain medical/ health services (i.e. blood test) the higher is the tendency for prices to cluster around the going rate prices. There are however locational variations in the level of the prevalent prices with the going rate higher in large town or metros. This does make economic sense also as cost of offering medical services in metropolitan towns versus a small town may be much higher.

2.6.3 Demand Based Pricing

The third approach to pricing, demand based pricing is based on the consumer ability to pay or willingness to buy at a given price. Provider of health services typically base their pricing decision on consumers' perception of value of the service offered. Consumers' perception of value in case of health services, which are highly intangible in character and whose quality is extremely difficult to judge prior to the purchase of the service are dependent upon a number of variable. Among them are service cures like exclusively of the service, the brand name, the perceived non-monetary costs (discussed earlier) and other assessments like physical infrastructure and word of mouth publicity from friends, relatives and other users. Central to the concept of demand based pricing is the

understanding that different segments of consumers will have different perception of the value they perceive in differently priced services, that different segments will have different capacities to pay and also that apart from the core benefit of freedom from disease or discomfort, some segments may look for other augmented benefits in the service package and may be willing to pay for them. Let us look at how different pricing strategies, under demand based pricing may be followed when consumer's definition of perceived value differs.

2.6.4 Pricing When Value to the Customer is Low Price

There are segments of the market where actual price to be paid may be the most important criterion of choice to the consumer. To go further, sometimes a reluctance to avail a given medical service may actually be sought to be offset by keeping the price very low. The technique that are followed in such conditions where the customer is acutely price conscious or defines value as being 'low prices' include the following.

2.6.5 Price Discounting

Hospitals may carry discounted prices for vaccination for certain fixed periods, when such services are targeted to low income segments of the society, to overcome the apathy or enable purchase by large sections of consumers. Discounts usually are offered on basic routine services. It must however be borne in mine that no amount of discounts would promote purchase unless the consumer has a felt need for the service. Health checks like regular mammography; pap smear tests etc. have a less than actual demand because a large section of population is not alive to the need for such tests or postpone them for psychological reasons.

2.6.6 Odd Pricing

This is the pricing technique used to create a lower perception of the price and entails in pricing the service just below the rounded rupee figure so that consumer feels he is paying a lower price. Off pricing is an example of psychological pricing and works very well in competitive markets specially for basic or routine services, where specialised skills may not be called for, but where the perceived lower figure becomes a determinant of repeat purchases.

2.6.7 Place Differentiates

Locations partly because they define market segments indirectly also sometimes determine the prices that will get charged. When doctors operate more than one clinic they may charge different prices in different locations depending upon the clientele's differential ability to pay.

2.6.8 Quality Differentiates

Bulk discounts such as corporate and organisations purchases are increasingly becoming common in health services as on the one hand organisations are making attractive medical reimbursements an integral part of their HR policies while on the other hand hospitals are becoming conscious to the necessity of having an assured and steady customer bases, the demand of which does not fluctuate widely.

2.6.9 Penetration Pricing

Discussed earlier under the market penetration objectives in pricing thus pricing strategy is followed to introduce new services at low prices so that trial may be encouraged. The strategy is specially useful where the threat of potential competition is very high. Care must however be taken that the initial prices should not be kept so low that they result in customer resistance when regular pricing is done, once the service becomes competitive.

2.6.10 Pricing Strategies when Consumers Value Perception includes Augmented Services and Prestige

Under such conditions when customers are willing to pay higher to get the desired package of additional conveniences or exclusively or personalised attention, monetary prices do not remain the main consideration in selection of a given service provider. As

high prices may actually be seen as being indicative of high quality or esteem attached with the provider and, therefore, the purchase high prices may actually be preferred prices. The strategies that may be followed are price skimming and prestige pricing. Price skimming is confined to introducing new services at price premium, accompanied by high promotional expenditure (discussed earlier under market skimming objective). Prestige pricing on the other hand is a demand based pricing where markets, looking at the kind of demand or clientele they have, offer high quality service at very high prices. Examples could be exclusive plastic surgeons, physiotherapists, psychiatrists who have a limited but high margin clientele and part of the status is generated by the exclusivity of the service. Services are consciously priced very high in keeping with the high level of service quality that embodied the service. Value additions may also take the form of privacy, comfort, personalised care, high doctors to patient ratio etc.

2.6.11 Pricing Strategies when Consumers' Perception of Value is Value for Money

When customers insist upon getting due value for money prices, service providers resort to value for money price, the two strategies that are generally followed here are:

2.6.12 Value Pricing

This strategy, based on the understanding of evaluation that the consumer will make on getting his money's worth, this pricing technique frequently used in the hospitality sector, entails in 'giving more for less'. It generally involves building together some related services that are needed by a large number of people and pricing the package lower than the services would have cost individually. Examples in the health sector can be found where camps for specific medical package like an eye camp, or vaccination camp are organised with two or three organisations coming forward to provide various services. The bundle has a large user base, and the price of the complete package, registration, medical transaction, brief stay and post transaction care is lower than the services would have cost individually. This is possible because of collaboration service assembly by two or three organisations.

2.6.13 Complementary Pricing

Sometimes called loss leader pricing – this pricing technique identifies complementarily between some of its services. While the basic service is priced low, the peripheral services can be priced to absorb some of the cost of the basic services and priced high. Examples could be a doctor charging low initial consultation but the prices for various treatments could be priced to take care of margins for both services. A dental clinic may have low consultation or registration charges but may price the follow up services like a root canal operation or a ceramic bridge assembly at a higher price. Hospitals may use low registration and room charges, but the consultant doctor's fees or the treatment like the charges for the operation can be kept high. The low prices of some services are thus allowed to complement the higher prices of the other services in the total package.

2.6.14 Price Bundling

A careful look at services provided by hospitals would show that patients utilize multiple services which go on to form a package. Not all patients would want to or need to utilize all associated services within a given package. Price bundling is a strategy which enables a hospital to identify differential packages of associated services and price the 'bundles' of services differentially, on the basis of how many associated services form a given bundle. A given patient having had an operation, may want to have round the clock nursing support and follow up nursing support at home when discharged, frequent checkups and weekly visits to one of the consulting doctors. Another patient having had a similar operation may be willing to use family support for his post operative general care, and may like to use the nursing help only for administering medication and needed paramedical support. It should be possible for the hospital to identify that these two cases actually make up two different service packages and thus price them differentially.

Price bundling is based on the understanding that it is possible to look at the service provided by the hospital as consisting to certain core services surrounded by levels of augmenting services. There may be patients wanting to avail all the facilities offered by the hospital and willing to pay for them. Others may want just the bare bone core service

and not the associated augmented services or may want to pay for only a lower level of augmentation. Recognising this differential ability to pay, the hospital could look at different 'bundles' packages that can be created for different segments of consumers and offer multiple packages at different price levels.

Activity 5

Comment upon the newer trends in payment enabling practices being followed by hospitals in your area. Can you think of ways which would add value for the patients in terms of added convenience/facilitation.

2.6.15 Market Segmentation Pricing

While health care and medical attentions, freedom from disease and pain are basic human needs, the market for health services is not a homogenous market, in that different customers have different abilities or willingness to pay, they differ in the levels of "quality" or comfort or associated value addition they may want, they differ in their sensitivity to prices and so on. Recognising this, health service providers segment their markets and charge different price to different group of customers. Public hospitals for examples have different price structures for non income tax payers, and sometimes for senior citizens above a certain age. A large number of private hospitals have a certain proportion of beds which are categorized as 'free' beds where the patient may have to pay only minimum charges for same services.

Another form that market segmentation takes place is where the hospitals have different categories of rooms like a general ward, single, double, deluxe or super deluxe categories and price them differentially. Here the prices are supposed to be rationalised on what is perceived to be different quality level of associated services, even though the costs of providing these services at the different levels may not be translated proportionately in the price differentials. A doctor giving post operative examination to a patient in the general ward and to another patient in deluxe room may spend the same time, let us say 15 minutes each in both situations, yet the overall price charged in the two categories will be different for instead of cost based pricing, demand based pricing has been applied to ensure demand from all segments and maximise total returns.

Activity 6

Looking at the practices followed in your town, identify the segmentation strategies used by hospitals. Are these effecting?

2.7 IMPLEMENTING THE PRICING POLICY : STRATEGIC CONSIDERATION

You must now be clear about the various bases that can be utilised to arrive at your pricing decision. In addition to variables like costs, demand and competition and the considerations of your own objectives in arriving at a pricing figure, there are certain issues which demand decision before you can implement and administer a pricing strategy. Lovclock has clearly focussed on these issues in terms of key questions that must be addressed while determining the pricing strategies. The following table highlights these issues and the underlying decision that must be made in order to be able to define and implement your pricing strategy.

How Much to Charge

As noted earlier in the beginning of this unit, the issue of costs is important for the pricing decision. The health service provider, however, would need to decide upon the relevant costs that must be considered while arriving at the pricing decision. Is the hospital trying to cover only the variable costs or all the costs, whether it has decided to allocate a share of the fixed costs across all priced services and is seeking to get them also covered? Is there a way in which costs of fixed goods such as land and building can be spread over all services or over a period of few years? Should the hospital have a basic package of core services priced at a certain level and then keep on adding to the price depending upon the

combination of value added services availed along with the core service? Answers to these questions would depend upon the choices you make and will thus determine the actual figure you want to finalise as the price for a given service.

For the market/markets that you cater to, you would also need to assess the prospective customers sensitivity to prices. In the first section we had discussed consumer's perceptions of value affecting his evaluation of prices to be paid. While for a lot of health services, because of their necessity and expediency nature, customer do not display high levels of price sensitivity, yet for frequently availed routine services like medical checkups, ultrasounds, dental fillings etc. wide price differential, may make customers go to alternative providers unless they are supported by superior value through accompanying services.

Price discounts should be carefully used. All discounts affect the overall total revenue to the organisations and reduce the contribution margin from each transaction. While offering specific price discounts to attract a given segment may create marketing opportunities in new segments, heavy discounting may actually interfere with the valuation of the service in the eyes of the high paying customers. Discounting over time, however is prevalent in the health sector, where understanding the customer reluctances to stay in a hospital over weekends some hospitals offset the dip in weekend utilisation of operating and post-operating services by offering substantial discount on operations during the weekend.

Advocates of psychological pricing suggest that when prices of services are in term of an odd figure e.g. a sonography costing Rs. 490.95 as opposed to Rs. 500, it gives the consumer the feeling of paying "somewhere around 400" rather than almost 500. Since people rarely carry an absolute figure in their mind as the price for a given service this perception of the price as "somewhere around 400" is likely to give a substantial competitive pricing edge to your prices if odd pricing or psychological pricing is used. Hospital administrators on the other hand and sometimes customer as well may actually welcome the convenience of round price figures.

On What Basis should Prices be Charged

As a complete service provider, you will need to identify the basis on which prices would be charged in your hospital. You would recognise that in your case, there could be actually more than one basis on which price could be charged. For example, fee could be charged for admission (or registration) and then on a time basis (duration of stay on a per day basis in the hospital) or on the basis of resources consumed (additional nurses hired for round the clock care). Different establishments also vary in their practices as to whether they should bill each element of the treatment separately or charge a single 'package price' for the whole transaction. It is however a good practice to have a price figure for each service element, even though the policy is to quote a package price to the customer.

Where should Payment be Made

You must clearly indicate the payment procedures in terms of whether the payments should be made and receipts collected at the reception counter or at the Accounts and Billing department if you have a separate section like that. Increasingly consumers today are using their credit cards to make payments. Where customers simply give their card number and ask for their account be billed directly. Policies allowing cheque payments for government employees may allow greater willingness for patients to choose one particular hospital over another. All these are example of facilitation provided especially if the payments are large.

Where and How should the Payment be Made

The two alternative options that service organisations use are asking the customers to pay in advance or to ask for payment once the treatment is completed. Most prevalent in case of medical care is the practice of asking the customer to ask for an initial advance deposit, with the balance being billed later as the treatment progresses or is completed. This practice makes sense because specialist services or time of specialists may need to be allocated or services brought in, expensive resources may need to be appointed and

scheduled in advance of the actual treatment. In addition, very often in the beginning of the treatment, the service provider is rarely ever completely sure as to what costs the treatment will actually entail, the complication that may arise, the additional services that may need to be provided. It is, therefore, prudent to ask for an initial deposit and then identify the billing inputs as they accrue.

How should Prices be Communicated

Once the decision on how much a charge and how the payments are taken, the hospital must at a policy level decide how the prices are to be communicated to the customers. Since prices constitute an important input in the purchase of at least some of the medical services, creating information access to prices can enable customer to minimise some of the uncertainty in decision making. Not only do customers need to have some information on prices in advance, they also need to have information on how and when would they be required to pay. It is, therefore, advisable to institutionally decide, how much information on prices is to be communicated and how? Should rate lists for various services be on display or the rate cards be given to customers once they seek that information. Decision on how public should know pricing information needs to be institutionally taken and then clear unambiguous communication of prices needs to be managed.

To define the term in the most comprehensive way we can say value to the customer in the sum total of all perceived benefits minus the sum of all the perceived costs. Looking at this concept of value, it must be clear to you that the larger the gap between perceived total benefits and perceived total costs, the greater is the value that the customer would perceive in a given service. To enhance this perception of value in a given price category, therefore, as a provider of health services you may follow two alternative strategies or follow a combination of both. Value can be enhanced by increasing the benefits that you give to your customers or by rendering costs. On the side of costs, apart from the monetary costs, in services like health, other costs like cost of time (waiting in the reception, waiting for an appointment), cost of effort (in terms of access to location), cost on account of stress and sensory costs like fear are very relevant. If the provider can manage to reduce some of these costs, he can alter the customers perception of value of his own service. What you must appreciate is that while comparing alternative providers of health services, customers use this perception of 'net' value i.e. the difference between perceived benefits and perceived costs, rather than just the figure of monetary prices. You must, therefore, consider carefully the perceived benefits that are associated with your hospital services and the perceived costs that the customer has to bear, before arriving at a monetary price figure for your services.

Activity 7

Based on your knowledge of practices regarding communication of prices by clinics/ hospitals, prepare a note on what needs to be done further looking at the customers need for information on the one hand and the peculiar nature of the health service on the other hand.

2.8 LET US SUM UP

Pricing of health services poses several issues for decision makers in view of the sheer diversity of both the type of provider and the vast variety of consumer. In this unit you have studied the role prices play in consumer valuation of health services, the kind of pricing objectives of the organisation. Organisations may seek to achieve while deciding upon their pricing policy and the various factors that are utilised to arrive at the pricing decisions. Issues requiring decisions while implementing the pricing policy have also been identified. The unit has covered the inputs that go into the pricing equation as well as the consumer use of price in his buying decision for the health services.

2.9 SELF ASSESSMENT QUESTIONS

1) In a service like health, how important is price in the consumer's selection of a service provider? Justify your answer by giving reasons.

2) Why is pricing for health services unlike the pricing of a product like toothpaste or a car? What difficulties can be envisaged while pricing health service on account of the fact that health is a service and not a product.

3) What do you understand by patronage oriented pricing objectives? Are these relevant for the health service sector?

4) Compare and contrast Market Skimming and Market Penetration Policies as alternative strategies of pricing. What are the conditions under each is likely to be more successful.

5) What are the dangers that you can associate with price discounting as a policy in the health care sector? When can price discounting, according to you, be used.

6) Discuss the problems associated with cost based pricing in health services. What are the ways to overcome these problems.

UNIT 3 HEALTH ECONOMICS

Structure

3.0 OBJECTIVES

After studying this unit you should be able to:

- describe basic concepts of health economics and its application in health sector;
- discuss techniques of economic evaluation;
- explain demand, supply and price mechanism; and
- understand the various ways of resource generation and their allocation.

3.1 INTRODUCTION

In this unit you will learn about the basic concept of Health economics, demand and supply mechanism and how they operate, some ideas about the production function and briefly about how to generate resources and their allocation and utilization.

- The achievement of objective for health for all requires that resources are made available to health sector and are used efficiently. Economic recession has exacerbated the problem of financing health sector.
- The funds are not always used in ways that will have maximum impact on the health of the people.
- This unit provides introduction to health economics for health professionals and presents basic economic concepts and their potential application in health.

3.2 DEFINITION OF HEALTH ECONOMICS AND ITS APPLICATION IN HEALTH AND HOSPITAL PLANNING

3.2.1 Definition of Economics

To understand health economics and its contribution to health and hospital planning, the starting point is definition of health economics. Samuelson, the author of one of the mostly read text book of economics, defines economics as:

"The study of how people and society end up choosing, with or without use of money, to employ scarce productive resources that could have alternate uses, to produce various commodities and distribute them for consumption, now or in the future among various persons and groups in society."

It analyses costs and benefits of improving patterns of resource allocation. Economics do not restrict itself to any particular activity, it applies to all activities wherever there is scarcity and there is thus need for making choices. Therefore, it is the study of scarcity and choice.

Positive Economics : It is about describing and analyzing decisions to do with scarcity and choice. It is concerned with what is or was, or will be.

Normative Economics : It makes judgement about norms or standards to be applied. It determines what should be and not merely what is.

Health Economics : It can be defined as "application of the theories, concepts and techniques of economics to health sector."

It is concerned with:

1) allocation of resources between various health promoting activities.
2) the quantity of resources used in health delivery.
3) organizing and funding of health institutions.
4) efficiency with which resources are allocated and used for health purposes.
5) the effects of preventive, curative and rehabilitative health services on individuals and society.

Activity 1

With respect to your own state, identify the decision of the government which will fall within the scope of health economics, which of these decisions will fall under normative economics and which under positive economics.

3.2.2 Contribution of Health Economics to Health Planning

Health planning and health economics are both about choices. Health planning is choice between one future or another; choice between various ways of achieving that future. Health economics also relates to choice about how to optimize the use of resources within various activities. Economic considerations play a key role in all aspects of life such as industry, housing, agriculture, health etc. The major determinant of the country's health status is the level of economic development. Health policy of the country is strongly influenced by economic considerations. Vice versa health of the population can also influence economic progress of the country. For example to improve the social and economic welfare of people requires strategy which demands selection of those health programmes which improve health most efficiently such as health services, the provision of other health infrastructure such as water and sanitation, or action at improving nutrition etc. Health economics can help evaluate such choices. Governments are actively seeking ways of containing costs, increasing efficiency and finding additional resources. Health economics is important as it helps improve the allocation of resources, increase their efficiency, identify most cost effective technologies and evaluate alternate sources of health finance.

3.3 ECONOMIC DEVELOPMENT AND HEALTH

Economic development is a process having number of aspects. The three important aspects are economic, demographic and health.

3.3.1 Economic Development

Economic development is a broader concept than economic growth. When the economies grow in terms of national income and per capita income, certain structural changes accompany the process of growth. Conceptually the trends in income and the structural changes together constitute economic development. Income per head varies between nations and there is systematic relationship between income and other differences which include production patterns, consumption patterns, demography, health and health inputs between rich and poor countries, e.g. in poor countries agriculture is more important, smaller population lives in towns, people spend relatively more on food and little on consumer durables etc.

3.3.2 Demographic Development

Economic development results in demographic transition. In the earlier part of the century, population has grown very slowly because high birth rates have been offset by high death rates. But with economic development; richest countries are again in a situation of low population growth because lower birth and death rates.

But in transition the death and birth rate do not move in step. Death rate falls first and in combination with high birth rates produce a period of very rapid population growth. Only when birth rate falls population will stabilize. This may take decades. Therefore, the demographic transition has also its own momentum but is partly controllable. The speed at which birth rate follow the fall in death rate, is believed to depend on the fact that greater child survival causes parents to desire less children. Therefore, there is justification in making huge expenditure on population control programmes.

3.3.3 Health Development

It is a process by which population moves from low level of health to high level of health. The nature of these changes can be seen in case of infant death. At lower levels of health i.e., high infant mortality rate, most infant deaths are associated with communicable diseases e.g., diarrhoea and respiratory conditions. At intermediate levels the common infectious diseases are replaced by range of conditions which require institutional care. At high levels of health (IMR 10 or less) infant deaths are reduced to a core of congenital conditions and expensively institutionalizable diseases. For children and young adults the same basic pattern is found. However, in older age the gap between countries with low and high general level of health tends to narrow, e.g. infectious diseases are much less important relative to chronic and degenerative diseases such as

cancer, stroke, diabetes, arthritis and mental conditions which are common to all countries.

Relationship between Economic, Demographic and Health Development

What is the relation between economic, demographic and health development. Economic development provides the extra resources for better nutrition, better housing and sanitation, health services and technology. This leads to lower mortality, which triggers demographic development. But it is not always that simple, for example, unless the demographic transition is completed, many of the gains from economic growth will be absorbed by high rate of population increase. Economic development promotes better health but better health, by reducing burdens of sickness and uncertainty, facilitates economic development. The relationship between economic, demographic and health development is a complicated system of interacting variables.

3.3.4 Production and Health

Economic development is usually accompanied by changes in pattern of production which interact with health of the population. Their interaction may have unfavourable effects on health and damage to health may be direct and concrete e.g. Bhopal Gas Tragedy in 1984 and Chernobyl disaster in 1986. In some cases there is indirect effect, e.g. irrigation leads to increased agricultural output but creates a suitable environment for the spread of water borne diseases such as schistosomiasis, the use of insecticides result in the emergence of resistant strains of malaria mosquito, making control of malaria more difficult.

In some cases from the economist's point of view the development is always potentially favourable to health. Health care industry is itself a form of production.

3.3.5 Distribution and Health

The proceeds of economic development are not necessarily equally distributed between persons and groups (e.g. resources for health services, income in general etc.). Strict equality is not possible for health services in general. What is sought is equity i.e., fair shares for all obtained through the avoidance of inequalities which are not necessary or socially acceptable. Health services like many forms of production are subject to diminishing returns i.e., the more resources that are applied to given population, the less the increase in output (health) obtained from adding one more unit of output.

3.3.6 Consumption and Health

Private Consumption Pattern

Patterns of consumption tend to vary in a predictable way with income. Income-Consumption relationship can be understood through the economic concept of elasticity of demand. The income elasticity for a particular category of consumption say health, can be defined as percentage change in expenditure on that item i.e., health, associated with a 1% change in the consumer's income. Income elasticity of more than one means an item of consumption takes increasing share of total expenditure as income increases. Medical care has an income elasticity of more than one.

At national level poor country will spend 2-3% of national income on health care where as richest countries spend up to 10%.

Activity 2

From your own environment pick up examples to illustrate the following:

1) How does economic development affect demographic transition?

2) Why does the gap between the countries with high level and low level of health tend to narrow in old age?

3) How can improvement in health promote economic development?

3.4 ECONOMIES OF SCALE AND MONOPOLY

The relationship between input and output as the scale of production increases can be represented on a scale known as Economies of Scale or Scale of Economic efficiency. Economic efficiency deals with the least combination of the inputs, which will produce the desired output e.g. given the hospital fixed budget, output that can be maximized alternatively given a fixed quantity of services.

Economies of Scale has three forms:

i) Constant returns to the scale.

ii) Increasing returns to the scale (Economies of Scale).

iii) Decreasing returns to the scale (Diseconomies of scale).

3.4.1 Constant Returns to Scale

When input increased in same proportion, it is possible for the output to increase at same rate, e.g. if the inputs in the immunization programme such as vaccines, publicity, immunization centres are increased by say 10% and the number of children vaccinated also increase by 10% the programme is experiencing constant returns to the scale.

3.4.2 Increasing Returns to the Scale (Economies of Scale)

When output increases at a higher rate as compared to input i.e. for the example given above if the number of vaccinated children increase by 15% or more the programme is experiencing increasing returns to the scale. This is known as economies of scale. This phenomenon of the output rise at a rate higher than the rate of increase of input on account of larger volume of input is referred as economies of scale.

As the scale of production increases, managerial inefficiency and problems of large scale production are seen eventually leading to diseconomies of scale.

Economies of scale are important in planning of programmes, planning for hospitals, planning for facilities etc.

3.4.3 Decreasing Returns to the Scale

When output increases at a lower scale as compared to input i.e. the number of vaccinated children increase by say only 5%, the programme is experiencing decreasing returns to the scale. This is known as Diseconomies of scale.

3.4.4 Monopoly

A monopoly exists when a firm or individual produces or provides and sells the entire output of same commodity or service, e.g. if only one pharmaceutical company is the manufacturer of a particular drug and sells the same in the market. There are some instances of economies of scale and tendency to natural monopoly in health care. Examples include hospitals and pharmaceutical firms. More often, the market is characterized by a limited degree of competition between two large producers (i.e. oligopoly). Price competition may be reduced in these circumstances by collusion. Competition, instead gets limited to non price competition, for instance advertising of brand names.

Activity 3

a) From the health scenario in the country, select illustration to show how economies of scale have been positively utilised to improve the status of health in this country.

b) From your experience, cite examples where monopoly in the health sector has had:

   i) beneficial effects for consumers of health services.

   ii) negative effects for consumer of health services.

3.5 EXTERNALITIES (SPILL OVER EFFECTS)

Externalities exist when the level of consumption or production of some good or service by a consumer or firm has a direct effect on the level of welfare of another consumer or firm, as opposed to indirect effect through the price mechanism. Certain activities have spill over effects on other producers or consumers. These effects are called externalities. These effects may be desirable or undesirable. A very good example in the health field is the protection against disease provided to others when an individual is immunized. Another example is public health measures such as sewerage and drainage.

Externalities can be positive (beneficial), or negative (i.e. harmful). A particular type of externality is known as Public Good. These are commodities or services that (a) can be used, consumed or enjoyed by increasing number of people without diminishing the amount available to others, (b) are available to every one in the catchment area independent of the size or existence of payment, (c) cannot be withheld from non-payers. Health care service characterised by the problem associated with public good is malaria control through environmental management (e.g. cleaning ponds). Here it is not possible to exclude non-payers from the benefits.

Activity 4

Classify the examples of the common externalities in the health sector into positive and negative externalities.

3.6 PRODUCTION FUNCTION

Production is the process of producing goods and services, which satisfy human wants.

There are three components common to all production activities:

Input : Various resources such as manpower, equipment available for production capacity.

Process : Describes the transformation or productive technique which changes inputs into desired outputs.

Output : It is the end result of production.

In economics, the relationship between these components is described within the framework of production function. Production function is a way of representing, both qualitatively and quantitatively, the relationship that exists between inputs and outputs.

The relationship between input and output is represented by a production function of the type:

$Q = f(L,K,T)$

Q = output, L = labour, K = capital, T = the way L&K are combined.

It says that output (Q) is a function of combination of labour (L) and Capital (K), and the way in which they are combined (T).

Health care systems are not simple productive units. They produce many different types of outputs simultaneously and sometimes even unintentionally.

The way these outputs are produced is often poorly understood and it is often difficult to relate particular output to any one interaction or activity.

The Production Process

A) The production process has following components:

1) Final outputs e.g. longer life, better health related quality of life.

2) Intermediate outputs e.g. reduction in symptoms, fewer cases of a disease, changes in a disease stage.

3) Activities e.g. tests carried out, vaccinations given, surgical procedures performed.

4) Inputs e.g. doctors, nurses, health promotion staff, buildings, equipment etc.

B) The production process is concerned with turning 4 into 1.

C) Theory of production : The production theory enables us to raise issues like:

- What are the feasible ways of producing outputs?

- What are the efficient ways of producing outputs?

- What is the cheapest way of producing outputs?

The basic premise is that there are always many different ways of producing a final output, the differences may be of strategy such as:

Example 1 : Reduction in deaths of Very Low Birth weight babies using surfactant replacement therapy or by treating mothers with corticosteriods.

Example 2 : Reduction in malaria morbidity by nets, vector control or prophylaxis.

Example 3 : Reduction in TB by immunization or treatment with antibiotics.

Further within a basic strategy there may be a choice as such.

Example 4 : Substitution of junior doctors for senior, substitution of nurses for junior doctors, substitution of alarmed monitors for observation.

Example 5 : Day's case for in-patient surgery.

Example 6 : Lithotripters for "keyhole" surgery, 'keyhole' surgery for open procedures.

Interventions may be quite different, but aim is for the same intermediate output (e.g. stone free gall bladder).

D) Given the choice of ways of producing final outputs, the choice should be based on minimising the cost of achieving any given output. The best method can change if the relative cost of inputs change (e.g. a wage rise for one category of staff, cheaper equipment), or when technology changes.

E) Production can exhibit increasing, constant or decreasing returns to scale.

Increasing returns to scale are more common where it is possible to change the technology in use above a certain level, or where some necessary input is only partially used, e.g. since herd immunity becomes possible. There are also possibilities for scale economies in providing for services with large uncertainty (e.g. accident services).

Where services are very labour intensive, and the ratio of staff to patients is constant, then constant returns to scale are likely. Decreasing returns to scale are likely when access is costly, when management problems arise at larger outputs.

F) 1) Production is feasible whenever combinations of inputs can be turned into outputs.

2) Production is efficient when it is not possible to reduce the use of any one input (holding other inputs constant) without a loss of output.

3) The cheapest efficient production will depend on prices of inputs.

3.7 EQUITY AND HEALTH

Equity in health implies that ideally everyone should have a fair opportunity to attain their full health potential and, more pragmatically, that no one should be *disadvantaged* from achieving this potential, *if it can be avoided.*

Equity is, therefore, concerned with creating equal opportunities for health and with bringing health differentials down to the lowest level possible. Equity in health care is defined as:

- equal access to available care for equal need.
- equal utilization for equal need.
- equal quality of care for all.

Unequal access to health services may be due to:

- differentials in income, religion, race, sex, age or other factors not directly related to the need for care.
- high transport costs.
- inconvenient opening hours of health facilities.
- language and cultural barriers.
- resources and facilities being unevenly distributed around the country.
- resources spent on high technology medical services catering to only small segment of population.

Principles of Equity

a) Horizontal equity

— equal treatment of equals

b) Vertical equity

— unequal treatment of unequals

General Principles for Action

1) Equity policies should be concerned with improving living and working conditions such as safe housing, clean drinking water, controlling pollution etc.

2) Enable people to adopt healthier life styles.

3) Decentralize power and decision making, encouraging people to participate in decision making process.

4) Making high quality health care accessible to all.

5) Health impact assessment.

6) Research, monitoring and evaluation.

Is equity Achieved through Market

Markets do not necessarily result in equity, e.g. market exacerbates income inequalities by allocating goods or services according to the ability to pay thereby undermining the health of those who cannot afford health care. Therefore, some intervention is required to protect those who are most likely to be sick and least able to afford health care.

Activity 5

You are now witness to the era of market led competition in the health care sector. How can equity be achieved through market processes? Comment.

3.8 TECHNIQUES OF ECONOMIC EFFICIENCY

3.8.1 Economic Efficiency

In everyday use efficiency means value for money. For economists it has precise meaning. In health sector it means use of health resources in such a way that population is as healthy as possible. It deals with the least cost combination that will produce desired output and in fixed budget how output can be maximized or given fixed quantity of services in a hospital how cost can be minimized. To achieve economic efficiency two criterias must be met i.e. Effectiveness and Efficiency.

Effectiveness

It identifies the technical considerations for transforming inputs into outputs. There are many ways of achieving an output. Some of them may use inappropriate technologies or more resources than are necessary to produce a given level of output. Effectiveness is concerned with process of minimizing waste or effort when achieving an objective.

Efficiency

It takes into account the cost of resources used in production and then compares them with the cost of the output produced. In other words it relates to output per unit cost of the resources employed. Resources are being used effectively if a given output is produced at a minimum cost, or maximum output is produced at a fixed cost.

3.8.2 Operational Efficiency

Producing given output at minimum cost or maximize output for given cost.

3.8.3 Allocative Efficiency

Allocate resources between health and other objectives in relation to the value society places on health relative to other social objectives and the cost of achieving those objectives.

There are three conditions for achieving efficiency:

i) Correct mix of outputs.

ii) Technically efficient production process.

iii) Least cost combination of inputs.

Techniques of economic evaluation concerns in achieving these three conditions.

Techniques of Economic Evaluation

Definition

" The quantitative analysis of the relative desirability to the whole community of investing in alternative projects or programmes."

The desirability is assessed in terms of both costs and consequences. Consequences is used as generic term for the beneficial results of the programme.

Essential Features of Economic Evaluation

1) Desirability assessed through comparing costs and benefits (effects)

2) Comparison of alternatives

3) Concerns with costs and benefits to whole society (not just Government)

Forms of Economic Evaluation

There are many forms of economic evaluation but only those forms, which examine both costs and consequences for two or more alternatives can be described as economic evaluation studies. The various forms of economic evaluation are:

1) Cost Minimization Analysis.
2) Cost Effectiveness Analysis.
3) Cost Benefit Analysis.
4) Cost Utility Analysis.

Cost Minimization Analysis

It is based on prior epidemiological findings. The technique identifies the least cost intervention, e.g. if reduction of disability is achieved to the same degree by two interventions than which is the least cost intervention to achieve reduction of disability.

Cost Effectiveness Analysis

It does not question the objective. It finds out the best way of achieving a desired objective by comparing effects with costs. It evaluates either:

1) Which of the number of possible interventions will achieve a given health objective for least cost, or
2) Given a fixed budget, the intervention that maximizes the effectiveness of expenditure.

Results are expressed as costs per unit of output i.e. total cost of intervention divided by total health effect or as effect per monetary unit i.e. total health effect divided by total available resources.

Examples

1) Finding out cost effective methods for shistosomiasis control from amongst chemotherapy and water, chemotherapy alone, water supplies, or molluscicides.
2) To find out most cost effective test for cancer screening.

The problem of cost effectiveness analysis is that it cannot take account of multiple effects or consequences. It also cannot tell how large a programme should be.

Cost Benefit Analysis

It investigates whether the benefits of a project or programme exceeds costs. It involves identifying, measuring and valuing all relevant costs and benefits over an appropriate time period. In cost benefit analysis objectives can be questioned. It values both costs and benefits in monetary terms and is expressed by benefit / cost ratio i.e. benefits divided by costs. If the cost / benefit ratio is more than one, the project / programme is worthwhile, e.g. Cost benefit analysis for three programmes to eliminate severe vitamin A deficiency i.e. Public health intervention or monosodium glutamate fortification or mass dosage.

Cost Utility Analysis

It is a form of cost effectiveness analysis but it measures effects of the project or programme in terms of utilities. Like cost effectiveness analysis it can focus either on minimizing costs or maximizing effects. Results are expressed in terms of Quality Adjusted Life Years (QALY) or QALY's per monetary unit. It permits choice between wider range of options.

The most commonly used techniques of economic evaluation are cost benefit and cost effectiveness analysis.

Problems of Economic Evaluation

- Technical problem due to lack of information and the shortcomings of units of effect.
- "Efficient is not always sufficient" as the sole criterion for decision making.
- The economic evaluation techniques are used inappropriately to impose value judgements of specialists on the community as a whole.

Strengths of Economic Evaluation

- Methods for obtaining the best value for money from the use of available resources.
- It provides framework within which to consider the use of resources.
- They have important role to play in management issues, where the emphasis is on assessing how best to provide services rather than identification of priorities for investment, e.g. services should be provided in health facilities or homes.

Activity 6

Select any recent major buying decision taken by your hospital. On the basis of the information given in the section above undertake the economic evaluation of the decision. What is the type of information you would need to utilise to conduct the evaluation?

3.9 DEMAND, SUPPLY, ELASTICITY OF DEMAND AND SUPPLY

In order to optimize use of scarce resources, an efficient information system is required to bring together the values of the alternative uses of resources (products) with their production cost, and to co-ordinate the many decisions of consumers and producers. The price or exchange system, although imperfect, attempts this difficult task and plays a central role in economic analysis. It influences many health and health care programmes either directly or indirectly (e.g. through markets for personnel, drugs etc.). It is thus important to consider the workings of the price system, through an examination of demand and supply.

3.9.1 Demand

Demand is the desire for a good combined with the willingness and ability to get the desires fulfilled. In economics, the quantity of a particular good demanded is seen as a variable determined by a range of factors.

The *demand function* summarizes this relationship:

$Qd = f(P, RP, Y, T, ...)$

The quantity demanded (Qd) is some function of the price of the good (P); the prices of other related goods (RP); income (Y); and the organisational and institutional structure of society and preferences and tastes of individuals (T) which will depend on many socio-economic and cultural factors. The demand function can represent the demand of an individual demanding a particular good in which case it is simply the sum of individual demands.

Demand Curve

The relationship between demand and price is often portrayed as a *demand curve* (Fig. 3.1). It illustrates how much would be demanded at each price. For most goods, more is bought as the price falls and so the demand curve will slope downwards.

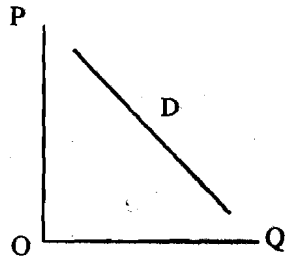

Fig. 3.1

In using a two-dimensional drawing of the demand curve it is assumed that the other factors (RP, Y, T) remain constant. As far as health care is concerned there may be some exceptions to the downward slope e.g. addiction.

3.9.2 Elasticity

The degree of responsiveness of one variable changes into another. If responsiveness is high, it is termed as elastic; if low, inelastic.

Elasticity of Demand

It is the responsiveness of demand to change in variables. It is reflected in the shape of demand curve.

Price Elasticity of Demand

Price elasticity of demand is measured by expressing the percentage change in quantity demanded (Qd) as a proportion of the percentage change in price (P).

$$\frac{\%\text{ change in Qd}}{\%\text{ change in P}} = \text{Ed}$$

If the percentage change in Qd is greater than the percentage change in price, the demand for a good is elastic, Ed > 1. If the percentage change in quantity demanded changes by less than the percentage change in price (Ed < 1) the demand is inelastic. If the percentage change in price evokes a similar change in percentage quantity demanded then the demand is unitary elastic, (Ed = 1). Elasticity will depend upon the ease with which goods can be substituted for one another.

Income Elasticity of Demand

It measures the response in quantity demanded (Qd) which arises from changes in income (Y):

$$\frac{\%\text{ change in Qd}}{\%\text{ change in Y}}$$

Cross-elasticity of Demand

It measures the response in quantity demanded of good A (Qda) which arises from changes in the prices of other goods or services (Pb):

$$\frac{\%\text{ change in Qda}}{\%\text{ change in Pb}}$$

It measures the degree of association amongst goods, i.e. whether they substitute or complement (need to be used with) each other. An example of substitute could be day care/in-patient care and example of complementary care could be diagnostic/curative services.

3.9.3 Supply

In economics, supply is used in a sense symmetrical with demand. The quantity of a good that producers offer for consumption is seen as determined by certain economic variables, of which the most important is the price at which the good can be offered.

Supply Function

It is the function relating to the quantity supplied to the variables likely to affect it.

Qs = f (P, RP, C, RC, T.....)

The quantity supplied (Qs) is some function of the price of the good (P), relative prices (RP), costs (C), relative costs (RC), and tastes (T) which will include socio-economic and cultural factors.

The supply curve (Fig. 3.2) shows the relationship between the price and the quantity supplied. It will normally slope upwards indicating that more will be supplied if prices rise. The notable exception is the supply of labour, which in some situations has a backward bending supply curve above a certain wage level.

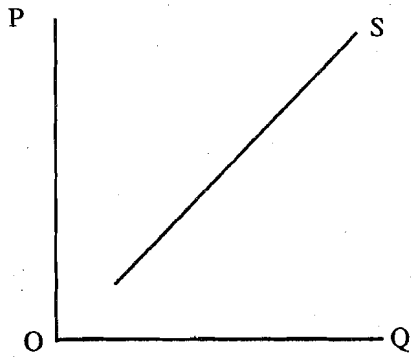

Fig. 3.2

Elasticity of Supply

The ease with which quantity supplied will respond to changes in price is measured by the elasticity of supply, and it is reflected in the shape of the supply curve.

The elasticity or responsiveness of supply is roughly measured by expressing the percentage change in quantity supplied (Qs) as a proportion of the percentage change in price (P):

$$\frac{\%\text{ change in Qs}}{\%\text{ change in P}} = \text{Es}$$

Like the elasticity of demand, supply is described as elastic where Es >1 and inelastic where Es < 1. Elasticity will depend upon the ease with which quantities of goods or services can be produced. In some cases over an appreciable time span it may be difficult to obtain any more goods, irrespective of the price offered, e.g. agricultural crops or production where the scale of activities is fixed in the short term.

Equilibrium

Equilibrium in a market is achieved when supply equals demand (Fig. 3.3). Price and quantity will adjust until the point is reached where buyers and sellers are content to exchange a given quantity (q1) at a given price (P1). The price so obtained will be the equilibrium price i.e. the value of the good of the consumer and producer is in equilibrium.

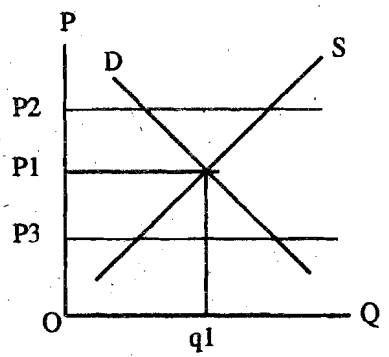

Fig. 3.3

At P2 suppliers will be willing to supply more than buyers are willing to purchase at that price. There will be *excess supply* and pressure to reduce prices. At P3 buyers will be willing to buy more than suppliers are willing to offer and there will be pressure on prices to rise – *excess demand.*

Supply, Demand and Policy

Supply and demand analysis can be used to consider policy changes such as the introduction of a *tax* on production and consumption of a good or *subsidy* on *price* or a policy of *price controls.*

Policy Instruments

Policy instruments used to intervene in the price system are:

a) Fiscal policies – taxes or subsidies

b) Control policies – limiting quantity (quotas) or price

c) Regulations – setting out conditions for exchange – whether, when, where, by whom and of what standard

d) Information/education, advertising to change values

e) Changing property rights

These instruments could be used to correct market imperfections and the demand and supply of a good or services can be controlled.

Taxation

Tax is introduced to raise revenue or change behaviour. Fig. 3.4 shows the effect of a tax. Price has risen and quantity purchased has fallen. The extent of the rise or fall will depend upon the tax change and the relative elasticities of the supply and demand curves.

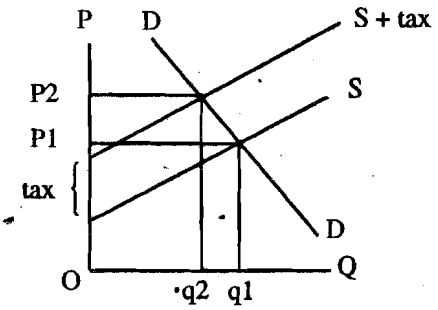

Fig. 3.4

Subsidy

Subsidy is introduced to protect the income of the producers, aid or protect an industry or to encourage use of a product by consumers who otherwise might be deterred by prices.

Fig. 3.5 shows the effect of a subsidy. Price has fallen and quantity purchased has risen. Again the extent to which changes occur depend on the responsiveness of demand and supply.

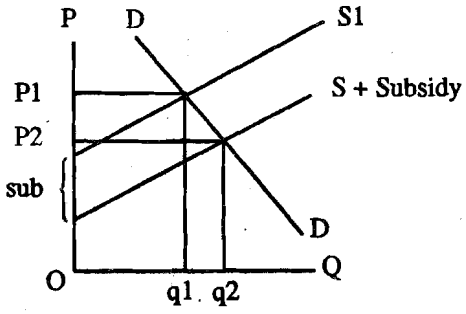

Fig. 3.5

Price Controls

Any Government can by decree fix the prices. The prices so fixed can be equal to, above or below the equilibrium price.

Fig. 3.6 shows the effects of the imposition of a price control (P2) above equilibrium price (P1). Price has risen and quantity demanded has fallen but excess supply (q1-q2) is available; unless this is managed there will be pressure on the market to bring down prices.

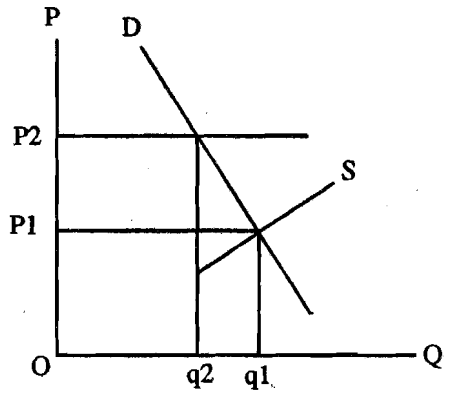

Fig. 3.6

Fig. 3.7 shows the effects of the imposition of a price control (P2) below equilibrium price (P1). Price has fallen and quantity has fallen. At this price there will be excess demand (q1-q2) and pressure to bid up the price unless some form of rationing is introduced.

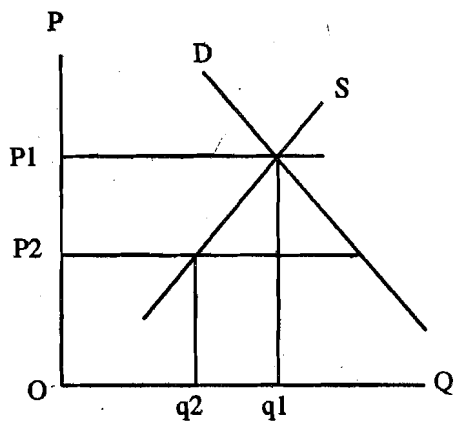

Fig. 3.7

Taxes and subsidies can be used to promote health. For example, taxes can be imposed on health-damaging substances (e.g. cigarettes) or on polluting industries, thus raising their price and reducing consumption/production. The extent of the reduction will depend on the relevant elasticities. Similarly, subsidies can be used to promote consumption or production by in effect lowering the price of health-promoting activities (e.g. zero-priced ante-natal screening or dental and eye checks).

Externalities and Demand/Supply Analysis

Values, as expressed by the amount people are willing to pay, reflect only the private assessment of values and no account is taken of society's values. If there is a difference between the individual's and society's valuation of a good or service, externalities exist, i.e. factors are important that are external to those taking part in the transaction. You have already learnt about externalities earlier.

Demand or Consumption Externalities

If there are positive, external benefits from the consumption of a good or service, society's demand curve will be to the right of the individual demand curve e.g.

immunization, preventive medicine (Fig. 3.8); if there are negative external benefits from the consumption of a good or a service, society's demand curve will be to the left of the individual demand curve e.g. smoking and consumption of fat (Fig. 3.9). In either case, without intervention, over or under-consumption would occur.

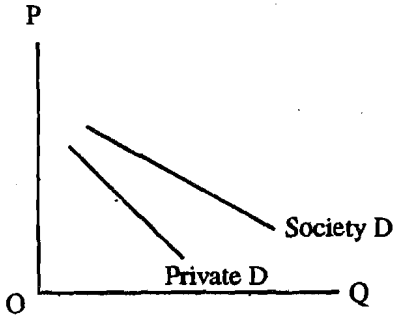

Fig. 3.8

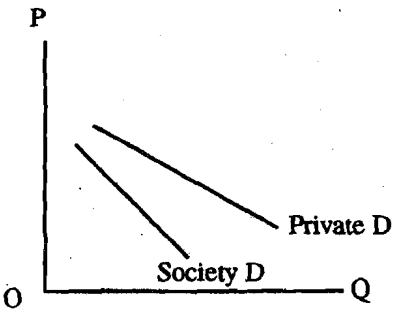

Fig. 3.9

Supply and Production Externalities

A similar situation might occur on the supply side (Fig. 3.10). The costs which underlie the supply schedule only represent the private costs borne by the supplier. There may be costs borne by others as a result of the activity undertaken when producing goods e.g. river pollution, noise pollution or the use of scarce resources.

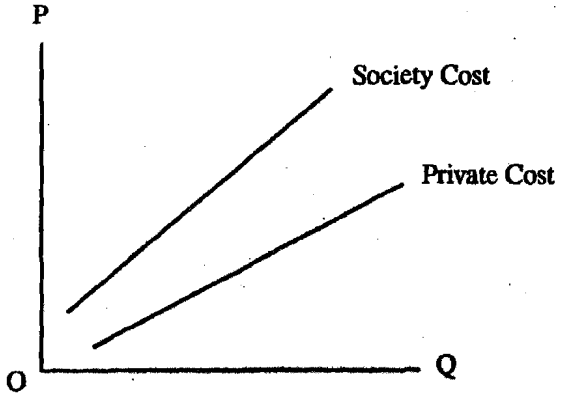

Fig. 3.10

Alternatively, the process may provide benefits in terms of amenities that can be used for other purposes and society's costs would then be below private costs.

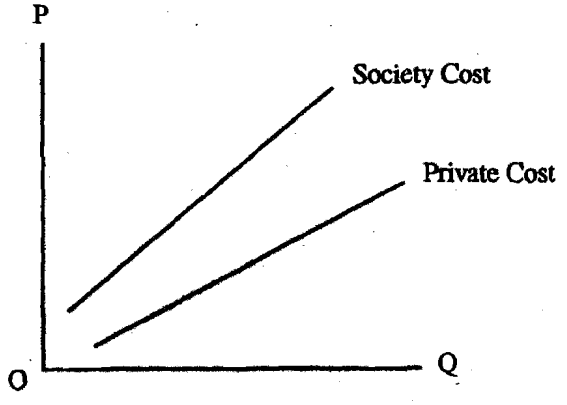

Fig. 3.11

Again, over- and under-consumption would occur if no intervention takes place. Intervention may take the form of taxes or subsidies of services, legislation to control output or price, or direct intervention in production and distribution of services.

3.10 HEALTH SECTOR FINANCING

Finance means provision of money as and when required. Health financing means raising

of resources to pay for goods and services, financing of health care does affects the provision and utilization of health services. Financing of health care is vital not only because of scarcity of resources but also sustainability of resources and resource efficiency considerations. The lack of information about health sector financing has undermined appropriate decision making. The studies of health sector finance have two main purposes, related to health sector problem: to investigate the efficiency of health sector and to provide information for financial planning. The information can be valuable for:

- Identifying who benefits from services?
- Identifying who gets what?
- Identifying current patterns of financing and encouraging discussion on alternative source of finance.
- Identifying and quantifying resource deficiency.
- Analysing resource deployment and identifying possibilities for re-deployment.

Methods of Health Care Financing

Health care financing can be through public or quasi-public sources and private sources. Some of the methods of health care financing are enumerated below.

a) Public and Quasi-public sources of finance:
   - i) General tax revenues
   - ii) Deficit financing
   - iii) Earmarked taxes
   - iv) Social insurance
   - v) Lotteries & betting

b) Private source of finance:
   - i) Private health insurance
   - ii) Employer-financed scheme
   - iii) Charity and voluntary contributions
   - iv) Community financing
   - v) Direct household expenditure

Criteria for Evaluating different Methods of Financing Health Care

1) **Efficiency**: Four aspects of overall efficiency with which financing mechanism raise and use finance are raising adequate sources, stability or reliability of financing sources, net use of the source and freedom and flexibility in the management of the funds.

2) **Equity**: To see the impact of equity of health care financing options it is important to ask 'who pays'? One way is that only those who benefit from the use health care (that is the sick or potentially sick) should pay for it – horizontal equity. The other way is that the distribution of the burden of paying for health care should reflect difference in ability to pay – vertical equity.

3) **Demand/utilisation** : Different financing methods have different effects on the level and type of service used. Some methods of payments influence consumer behaviour by the incentive to provide us to withhold or provide services.

4) **Supply/provision** : The method of financing affects the supply or provision of services. There may be bias with respect to the type of expenditure that they favour i.e., favouring curative rather than preventive services.

5) **Displacement effects** : Instead of generating additional resources new financing methods may displace funding from other sources, e.g. foreign assistance may displace Govt. funding for health care.

3.11 LET US SUM UP

In this unit you have learnt about the basic concepts of health economics and its application in the health sector. You have also learnt about the economic development and its relationship with demographic and health development. Further you have learnt about three forms of economies of scale and monopoly. You also learnt about production function which is the process of producing goods and services that satisfy human wants and have three components namely input, process and output. You have also learnt about equity in health which aims at creating equal opportunity for health and bringing health differentials down to the lowest possible level. You also learnt about the techniques of economic evaluation which include economic efficiency, operational efficiency and allocative efficiency.

You also learnt about four forms of economic evaluation namely cost minimisation analysis, cost effectiveness analysis, cost benefit analysis and cost uitlity analysis. Subsequently you have learnt the concept of demand, supply and elasticity and their application in policy instruments, taxation, subsidy and price control. Towards the end of the unit, you have learnt about health sector financing which is not vital only because of security of resources but also sustainability of resources and resource efficiency consideration. This also includes various methods of health care financing including public and private sources of financing.

3.12 SELF ASSESSMENT QUESTIONS

1) Define health economics.

2) Health economics analyzes ..... and ..... of improving patterns of resource allocation.

3) Name three applications of health economics.

4) What are the three components of production activity?

5) What do you understand by production process ?

6) Define Demand and Supply.

7) What are the different types of Elasticity ?

8) What are your expectations about the impact of tax on tobacco, alcohol, food?

NOTES

UNIT 1 LOGISTICS MANAGEMENT

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- explain principles of logistics management;

- describe functions of logistics management;
- plan and coordinate various activities of materials planning and management catering for optional stock of items;
- outline the systems of storage, distribution, classification, security and disposal of materials/equipment; and
- describe the hospital stores management.

1.1 INTRODUCTION

In this unit, we introduce you to the concept of Logistics Management with particular reference to hospitals. This has been explained by the way of understanding the objectives, principles and functions involved in the logistics management.

Logistics is a broad, far-reaching function, which has a major impact on a society's standard of living. In a health care institution, we have come to expect excellent logistics services, and tend to notice logistics only when there is a problem. Logistics has been called by many names, including the following : Materials management, Supply management, Industrial logistics, Business logistics, etc.

What these terms have in common is that they deal with the management of flow of goods or materials from point of origin to point of consumption, and in some case, even to the point of disposal.

The Logistics/Supply management in any health-care institution is that part of the entire hospital activity which deals with procurement, storage, transportation, distribution, maintenance and evaluation of drugs and equipment. Sufficient stocks of these varied types of items are to be maintained, primarily because it will be too costly to initiate action to procure an item at the time of need. Non-availability of an item when required by the user in a hospital could lead to 'Stock-Out' and adversely affect the treatment of a patient, or even create a life-threatening situation. On the other hand, over-stocking of items could lead to blockage of finance, which in turn would be a costly proportion to any hospital.

Hence, planning of logistics and supplies is a process of deciding what and how much of various items are to be kept in stock at a given time. It is also necessary to determine the lead-time involved and the appropriate quantity to be procured.

1.2 DEFINITION, GOALS AND OBJECTIVES OF LOGISTICS MANAGEMENT

1.2.1 Definition

"Logistics management can be defined as the process of planning, implementing and controlling the efficient, effective flow and storage of goods, services, and related information from point of origin to point of consumption for the purpose of conforming to customer (patient's) requirement."

An integral part of the logistics management process is *materials management*, which encompasses the administration of raw materials, subassemblies, manufactured parts, packing materials, and in-process inventory. Materials management is critical to the total logistics process.

Thus, "materials management is that process of management which coordinates, supervises, and executes the tasks associated with the flow of materials to, through, and out of an organisation in an integrated fashion".

1.2.2 Goals and Objectives

The primary goal is to obtain materials at the lowest possible price, which must go hand in hand with consistency in both quality and continuity of supply. The other goal is to maintain the minimum of inventory of materials so as to free the working capital for other useful purposes. Finally, all activities in this functional area of management process should be carried out at a minimum of cost.

Given the goals, let us now identify the objectives of logistics management, which can ensure the best performance, and use of materials in a hospital. These are as follows:

Primary Objectives

a) Good information system regarding the items
b) Right price of purchase
c) High turnover of the items
d) Low procurement and storage cost
e) Continuity in supply of stores
f) Consistency in quality of the product
g) Good supplier relations
h) Development of personnel carrying out materials management

Secondary Objectives

a) Forecasting requirement
b) Favourable reciprocal relationship between supplier and purchaser
c) Awareness of new materials and products.
d) "To make" or "to buy" decision.
e) Standardization of items.

1.3 PRINCIPLES IN LOGISTICS MANAGEMENT

1.3.1 Principles

Hospital managers must at all times be aware of the seven cardinal principles or elements, which may be utilized individually or in combination to achieve good results, which are enumerated below. These "righteous" elements can be achieved through various Management Techniques marked against each principle. At this juncture, it is sufficient that the students are aware that there are techniques, which can be applied. The gist of the techniques will be touched upon in other units.

Principles	Management Techniques
a) Right item/material	Value Analysis Standardization Codification
b) Right quantity	Purchasing Balancing of Inventories EOQ (how much to buy and when to buy)
c) Right price	Cost Analysis Price Value analysis
d) Right source	Market research Purchasing techniques Selection process
e) Right delivery time	Procurement technique Follow up PERT/OR
f) Right methods/systems and procedures	Work study System analysis Management information systems
g) Right people/attitude oriented towards innovative improvements	Organisational analysis Behavioural sciences Integrity

In addition, seven other supportive elements of procurement strategies include:

h) Right quality
i) Right place of delivery

j) Right transport

k) Right packaging

l) Right handling methods

m) Right materials intelligence

n) Right contract or legal aspects: This should cover all the above purchase parameters.

1.3.2 Essentials in Logistics Management

To follow the principles stated above, it is necessary that the students must understand certain essential values in logistics management of any hospital, to ensure fulfilment of the objectives, which are summarized as:

a) To develop a system of supplies whereby there will be right quantity of stock of items properly stored, easily retrievable, and distributed close to the points of usage, whenever required, at a given time. On the flip side of planning, if there is overstocking of the items, it will block part of the working financial in the hospital.

b) To ensure that the resources available are being used most effectively, and the stores are purchased at the most economical price consistent with the quantity.

c) To co-ordinate the activities amongst the various departments in the hospital, for optional and equitable utilization of the items being procured.

d) To reduce the inventory costs—both carrying costs and ordering costs, and to maintain the same.

e) To ensure that the receipt of stores is timely, and thereafter distribution time is also within a reasonable time frame.

f) To ensure that the inventory of stores is minimized by identifying items of common usage in the different departments of the hospital.

1.3.3 Procedural Planning Sequence

Having understood the essential requirements of logistics management, it is imperative that the sequential events of planning and control must be achieved, as follows:

a) To determine the categories of stock required, both in terms of quantity and quality of each item.

b) To procure the items necessary from the best, reliable and authentic source either from within or outside the country at economical prices.

c) To ensure timely supply from identified sources.

d) To ensure good storage, without loss of potency or deterioration of the item.

e) To carry out effective and judicious distribution of the stores throughout the hospital.

f) To develop an effective and realistic record-keeping system of the medical stores and equipment (manual /computerized).

g) To minimize losses through pilferage and damage, and utilization of the stores within the shelf life.

h) To carry out disposal of waste and scrap which cannot be utilized in the hospital.

i) Employing personnel conversant with logistics management of hospitals.

j) To ensure good performance of the personnel handling the system.

c) Inventory of the stores is minimized by .....

1.4 FUNCTIONS OF LOGISTICS MANAGEMENT

Logistics or materials management, as already defined, is that activity of management, which primarily concerns with the efficient flow of materials, to, through and out of an organisation for optimum use of materials. It, therefore, deals with several activities or functions which are vital for hospital, and covers maximum utilization, conservation, elimination of wastes, avoidance of unnecessary delays and assurance of right quality and in needed quantity of economic costs.

These multifold functions often cut across the classical functional boundaries, so that integrated functional control becomes necessary. This is important for any hospital because logistics costs are a significant part of the total product cost. Conventionally, logistics costs are buried under overheads as indirect charges under our present cost accounting system. Only direct and variable costs are highlighted which receive greater management attention.

In all hospitals, because of increased specialization, variety of items are being purchased in large quantity, resulting in consequent increase in expenditure on material inputs. As the purchasing function becomes critically important, the problem of systematic storage has increased *pari passu*. This requires highly trained professionals, to which the students are being made aware of in this unit. Now, let us identify the set of interrelated activities, which emphasize the entire flow of materials, to, through and out of a medical institution. An integrated functional approach treats each activity as a dynamic one. Each activity is characterized by high sensitivity, since each one influences and in turn is influenced by all others. An objective analysis of logistics management will reveal that it concerns itself with the **total flow of materials**, from forecasting of future demands down to final distribution at end-points. All these sub-functions are individually important, but at the same time it has to be realized that they are not isolated phenomena.

Thus the following functions or activities are listed as logical boundaries of Logistics Management:

a) Materials forecasting, budgeting, planning and procurement.

b) Scheduling, purchasing and procurement.

c) Receiving, inspection (quality and quantity) and forwarding.

d) Inventory control, storage, warehousing and distribution.

e) Materials handling, movements control and traffic, etc.

f) Despatch, shipping and disposals (including wastes, scraps and reclaimed/surplus materials).

In addition, there are also other functions which will need close attention of the logistics manager:

a) Coordination among the above major six activities,

b) Keeping liaison between the various departments of the hospital, and/or with the suppliers/market, and

c) Cost-reduction by variety reduction and value analysis.

1.5 TENDERING PROCEDURES, PROCUREMENT AND INSPECTION

1.5.1 Purchase Activities

Hospitals require supplies of materials and services from outside sources. Therefore, purchasing and procurement are common functions in almost all organisations. *Purchasing*

generally refers to the actual buying of materials and those activities associated with the buying process. *Procurement* is broader in scope and includes purchasing, traffic, warehousing/storage and all activities related to receiving inbound materials.

Purchasing activity starts with the recognition of a need. When materials requisition emanates either from the user department, stores department or materials planning, purchase department has to ensure its timely supply.

The next step is the selection of the right source of supply. Often, the purchase department has to develop alternative sources of supply and arrange for potential substitutes.

The responsibility of the purchase manager is from ascertaining the price of the item, which is a prime factor in source selection, timely delivery, quality assurance, reliability, credit availability, etc. according to the policy of the hospital.

Maintenance of records and files and good vendor-vendee relations are also important phases of purchasing activities.

The main **objectives** of purchasing may be delineated as follows:

a) To ensure uninterrupted flow of materials;
b) To buy economically in a competitive market;
c) To keep inventory investment low;
d) To develop good buyer-supplier relations;
e) To develop alternative and reliable source of supply; and,
f) To act as logistics intelligence information centre with regard to specifications, processes, price, quality, etc.

With these objectives in mind, the **functions** of the purchasing department may be summarized as follows:

a) Selection of supplies
b) Analyzing of bids
c) Price negotiations
d) Issuance of purchase orders
e) Follow-up actions
f) Cost analysis and market study
g) Maintenance of price catalogues, information library, etc.

Checklist of sources of supply

Selection of a potential supplier should be based on:

a) financial capacity,
b) manufacturing capacity,
c) total value of business,
d) service facilities,
e) business reputations and other customers, and
f) production processes and specifications to which the products are manufactured by the supplier.

In addition, a periodic rating of the supplier's performances item-wise should be carried out, regarding: quality, delivery schedule, business ethics, promptness and competitive bids.

Generally, all purchase orders must be covered by a requisition, whether for stock-replenishment or for non-repetitive items. All requisitions must be signed by authorized persons who are competent to do so. It must also have the full and detailed descriptions, specifications, drawings (wherever necessary) as well as estimated cost and expected delivery time. On having all these particulars, the buyer must float tenders or enquiry.

1.5.2 Floatation of Tenders/Enquiries

Enquiries should contain complete specifications, brand or trade names, and date on which tenders are to be received. All governmental buying and purchases in public sector undertakings resort to *Tender buying*. This ensures proper competition among the vendors.

Tenders are floated according to the system prevailing in the respective hospitals. This cannot be standardized since it depends on the size of firm, type of purchase, quantity, etc.

Tender systems may be any one of the following:

a) *Open tender*: By advertising in the requisite media of newspaper, bulletins, magazines, etc.

b) *Limited tender*: Often advertising is costly and increases the lead time, then bids are solicited only from reputed limited pre-qualified parties.

c) *Simple tender*: In case of only a single source, that firm is asked to submit his quotation in writing. Simple tender purchases should be avoided, as it leads to monopoly of proprietary item, which is against the basic objective of purchasing.

d) *Global tender*: When bulk purchase of special articles is involved, global tenders are invited through advertisements both in India and abroad.

The steps involved in Open tender system are:

a) Formulate the requirements clearly,

b) Establish bidder's list,

c) Invite competitive bids through advertisement.

d) Open the tender before the representatives on the notified date.

e) Prepare comparative statements on quality, price, and delivery schedules.

f) Evaluate the bid.

g) Award the contract for the *lowest responsible bidder* by taking a total view of the final product. Lowest implies being below the average standard. Responsible means answerable legally and morally.

h) The quotation should be low, consistent with the quality requirement.

i) The lowest bidder need not be the best bidder from the buyer's view.

j) Discounts such as cash discounts, trade discounts and quantity discount should be familiar to the buyer to ascertain the final price.

1.5.3 Types of Purchases

a) *Rate/Running contracts*: This system is prevalent in governmental buying, public sector enterprises and procurement by direct demanding officers. The rate of the item is fixed usually by the tender system. In rate contract, rate is specified but quantity not indicated. In running contract, the minimum quantity is also specified. Rate contracts reduce internal administration lead time drastically.

b) *Systems contracting*: This is a form of stockless purchasing, under which authorized employees may directly obtain requisition of material from the supplier's storeroom. Useful for low unit price, but high consumption values.

c) *Blanket order*: It is an incomplete contract with a vendor to purchase certain low value items. This becomes effective only when vendor receives a bonafide release requisition order. A typical example is an annual order for stationery items.

d) *Reciprocity*: It involves a policy of buying from one party, who in turn buys from another, so that it promotes good trade relations between the contracting parties. This decision of reciprocal buying and selling is a matter of top-management policy, rather than that of the purchase department.

e) *Bazaar purchase*: Also known as "cash purchase" or "imprest purchase" and is confined to urgently needed small items.

1.5.4 Negotiations

In the purchasing context, negotiation is essentially a discussion between a buyer and a seller with a view to reaching an agreement. The price agreement is a major factor in purchase and sale contracts, but other factors are also determined in such discussions. These parameters may be with regard to: price and payment schedules, delivery, quality and/or performance characteristics, specification variations, accessory benefits, insurance, spares, guarantee, warranty, freight, and other special features.

In any case, negotiation is considered very important in the buying process and when it is actually held, it creates a good buyer-seller relationship. Negotiation is an art, and the hospital purchaser must familiarize himself with the requisite details of the product, prior to the meeting.

1.5.5 Legal Aspects of Purchasing

All purchase orders signed by the purchaser on behalf of his hospital and commitments made therein legally binds his institution. It creates a contractual relationship as to the contract between the buyer and the seller as per the terms and conditions agreed to in the course of a deal. The purchase order or contract is, therefore, a legal document which has a direct bearing on the company as to the performance of the contract.

Law is complicated subject, and, therefore, its application and interpretation must be left to those who are competent to deal with it. As a primary rule, all purchasing personnel should consult competent counsel on doubtful or controversial points.

The students should always be familiar with the basic principles of contract and be aware of certain legal terminology, so as to minimize the area of understanding and conflict, and to avoid litigation.

Law of agency: This states that the acts of the purchaser (agent on behalf of the hospital) done within the apparent scope of his authority binds his hospital with respect to third parties (seller), in respect of any contract concluded.

Law of contract: A formal contract of purchase duly signed by an authorized hospital purchaser binds both the seller and the buyer. An offer becomes a contract only when it is accepted by the seller. A valid contract has four basic elements:

a) An agreement resulting from an offer and acceptance, understood in the same sense by both the buyer and the seller.

b) A consideration or an obligation imposed on both the parties.

c) Parties should be competent to contract.

d) The purpose of the contract should be within the existing laws of the land.

Legal Status of Buyer: The purchase officer while signing a purchase contract does so on behalf of the hospital. The buyer must, therefore, know the extent of his scope and delegated authority, either express or implied, to bind his hospital with the supplier.

1.5.6 Quality Assurance

Quality is the inherent characteristic and distinctive attribute that makes a product different from others. It ensures conformity to requirements. Products and services should be essentially free from defects, thereby becoming cost-effective.

In India, awareness of quality standards began with the establishment of Indian Standards Institution (ISI), now re-named as Bureau of Indian Standards (BSI). The bureau provides certification of quality, and at the same time keeps a check on the quality system.

The International Standards (ISO) with its headquarters at Geneva, maintains standards of manufactured goods and products within and outside the industry. The ISO 9000 series are norms aimed at documentation of procedures which define precepts, guidelines and processes to maintain discipline and quality management practices. Where design of the product is involved, ISO 9001 is required. If the design is already established, then ISO 9002 would apply, which means activity of production, installation and servicing is in conformity

with the requirements. ISO 9003 is applicable only when capability is demonstrated in the field of final inspection. These are various criteria for quality of material, depending upon the buyer's price consideration, availability of the item, their possible substitution and reliable sources of supply. In purchasing the right quality of materials, the following considerations are significant:

a) Determination of the quality

b) Defining it properly and clearly

c) Controlling it through some methods

The consideration of quality of the material has direct relationship to the technical suitability, physical availability and the economic consideration of price. The other two aspects are relative to the procedures of procurement.

Inspection

The role of inspection is to maintain standards of physical measurements and also to provide precise determination of physical constants and the properties of materials. It also provides the necessary methods and instruments of measurements required to utilize these standards. Further, through calibration services, it ensures the accuracy of various hospital equipment and instruments and working standards by comparing them with master standards.

The drugs, intravenous fluids, powders, etc. are also subjected to inspection by physical standards, chemical analysis (qualitative and quantitative) and stability of the items.

Depending on the type of the product and its nature, the amount of inspection is bound to vary. However, that does not reduce the importance of the subject, and more so, when lack of inspection may mean faulty purchases and defective store-holding.

The inspection duties are detailed as follows:

a) interpretation of specification given in the requisition or conforming to identified formulation,

b) measurement of product,

c) checking for conformance to specification,

d) disposition of product, and

e) maintenance of inspection records.

Inspection of stores are carried out in batches, with each batch being tested to thorough Sample Inspection. There are different methods adopted to the type of sampling, depending upon the product and its quantity.

Instruments and accessories have to be functionally checked before these are acceptable to stores. Sample of drugs and other hospital materials e.g. cotton, gauze have to be sent from the lots for confirmatory tests. Any defect or deficiency noted has to be reported to the vendor for corrective action. Reports of chemical analysis (if any) have to be preserved for future reference.

All rejections have to be reported to purchase department so that they know the quality performance of various vendors.

Check Your Progress 2

Fill in the blanks:

a) Purchasing pertains to ....., whilst procurement includes ....., ..., ..., ..., etc.

b) The main objective of purchase is ..... of materials.

c) Periodic check of supplier's performance is related to ....., ..., ..., ... and .....

d) Tender buying is resorted to all ..... agencies and .....

e) Running Contract caters to ..... and .....

f) Negotiation is an art involving ..... between ..... and ....., to reach .....

g) Law of Contract is a formal purchase contract between ..... and .....

h) BSI stands for ....

i) Inspection through calibration services ensures ..... of hospital equipment.

1.6 STORAGE SYSTEM, STANDARDIZATION, AND CODIFICATION AND CLASSIFICATION

1.6.1 Storage System

The process of storage system can be broadly viewed in a three-fold sub-systems i.e. the receipt system, physical upkeep and maintenance and the issue system. In a medical institution bustling with materials needs, the system design should cater not only for the current requirements of existing supplies, but also take care of the future growth potential and demands. The system should, therefore, be flexible to cope with the changing demand and supply environment.

The main objective behind the stores function is to render service to the users. The regular activities of the storage system may be enumerated as follows:

a) Receive the materials, check them for quantity, coordinate for inspection and quality checks, and prepare the stores receipt vouchers.

b) Accept the passed materials, prepare the rejection notes and complete the formalities for payment of bills.

c) Take into stock the accepted materials, store them in respective locations as pre-determined.

d) Prepare issue vouchers, make actual issues for disposal and account for the same.

e) Keep the purchasing team well informed through systematic indents and other reports.

f) Keep the storage place clean for facilitating handling and movements, and observe all safety measures and security regulations.The materials are to be arranged in such a manner so as to enable easy storage, minimized pilferage, proper identification and quick retrievals with minimum wastage of time and effort.

Stores Location and Layout

The storage system has to accommodate the inflow of materials, in-process inventories and outflow to the wards/outpatients departments. It usually takes into account the elements of space requirement, labour, equipment needs and costs to build/maintain the storage area. Any of the specific systems design planned has some advantages in sacrificing the accessibility to stock in favour of getting more stores in less space, or vice versa. It may thus not be possible to arrive at any absolute criterion for the efficiency of one storage system or another. The design, size and location of the storehouse must, therefore, be an integral part of the hospital design and management strategy. Storage of nature and type of the material is a crucial factor to be considered whilst planning the type of building or site. Bulky and slow-moving items in a hospital may be stored in a basement or ground floor level, pharmacy services may be planned on the ground floor or first floor depending on the layout of the out-patient department, dietary and laundry stores are preferable on the lower floor to accommodate the heavy equipment. However, dietary services may often be planned on a higher floor closer to the in-patient areas in a vertical-rise building. Hence, the students will appreciate the need for flexibility of ideas whilst planning the storage areas in conjunction with the hospital plans.

1.6.2 Standardization

Standardization is the orderly and systematic formulation, adoption, application and review of hospital institution standards, which leads to simplification or variety reduction. This implies reducing unnecessary varieties of items and standardizing to the most economical sizes, grades, shapes and colours or type of stores. It reduces the number of types and sizes of items to a minimum, consistent with the needs of the departments / hospital.

Benefits: Standardization has multiple advantages, some of which are:

a) The purchase manager can concentrate on large quantity of fewer items.

b) It is possible to place economic order quantity or orders of staggered deliveries with bulk discount.

c) Reduction of inventory will require lesser amount of working capital commitment of the hospital.

d) Items can be easily identified by all the stores personnel, as the bin location can also be standardized.

e) Reduces the time involved in negotiation process with the vendors, with better communication and prompt delivery schedules.

f) Procurement lead-time gets reduced, as all users know item.

g) Buyer-seller relations improved as purchase dimensions of cost, specifications, etc. are standardized, without scope for disputes.

h) Minimizes obsolescence of variety of items.

i) Possible to have rate/running contracts for standard items.

j) Assists in fewer annual maintenance contracts (AMC) of equipment.

k) Reduces inventory of spare parts of equipment to be stocked, thus giving cost-effectiveness.

l) Enables reduced inspection and quality control burden.

m) Interchangeability of parts is assured.

n) Efficiency of personnel handling stores/equipment is enhanced.

o) Reduces paperwork, improves inter-departmental coordination and ensures better communication between the stores department and end-users in the hospital.

The process of standardization should be entrusted to a task force in the hospital. They should obtain the relevant data/facts from the relevant departments and develop standards. There should be a constant reviewing, updating and monitoring committee to deliver the best benefits to the hospital. The role of standardization and variety reduction in inventory simplification has real significance in hospital logistics management field. This also assists in rationalized codification.

1.6.3 Codification and Classification

In hospitals, often the reason for stocking a large number of drugs and unnecessary items in inventory can be traced to different and misleading nomenclature, faulty numbering and use of trade or brand names used to describe the same item. It would, therefore, be useful to classify them as to their permanent basic or generic characteristics; group together all closely similar materials/items either function-wise or for its utility. This would reduce long, incomplete and ambiguous designations. Standard numerical coding should be evolved for the purpose of use in purchase, stores, issue and other purposes in order to symbolize fundamental and particular characteristics.

One of the pre-requisites of classification and codification is to know the basic nature and characteristics of all materials/drugs used in that hospital, and classify these in broad categories, and then to group and sub-group them in logical progression of types, sizes and functional usage. As for example, bio-medical equipment (department-wise), chemicals, laboratory, office (equipment and supplies), pharmacy (drugs), X-rays (films and chemicals), hospital linen, etc. can be classified, grouped and sub-grouped.

After the broad classifications as to their nature and use, a code or symbol is allotted to each of them.

Systems

There are various systems of codification in use: Alphabetical, Numerical, Decimal, Combined Alphabetical and Numerical, Brisch and Kodak systems. The system to be adopted depends upon the type of stores and organisational set-up.

Examples

a) **Alphabetical System**

Class	Group	Code
Table operating (TO)	Stainless steel (SS), Hydraulic (H)	TO-SS-H

b) **Numerical System**

Class	System	Generic Name with Strength	Family of Drug	Condition	Code
Drug	CVS	Atenolol - 50 mgm	Tablet	New	01-31-02/ 2-1-1
(01)	(31)	(02/2)	(1)	(1)	

c) **Combined Alphabetical and Numerical System**

Class	Sub-group I	Sub-group II	Code
Sulphuric Acid	SP	81	SP-81

d) **Brisch System**

A comprehensive system with usually a 7-digit numerical code assigned to each item with digital significance by virtue of their position and value.

e) **Kodak System**

Developed by Eastman Kodak Company, U.S.A., based upon numerical system and grouping done on purchase category, with 10-digits.

Class		Sub-class		Sub-class of 63		
Material	*Class Code*	*Item*	*Sub-class*	*Class*	*Sub-class*	*Kind of chair*
Furniture	61-70	Chair	63	63	2	Wooden

etc., till tenth digit stage of minor variation is reached.

Therefore, Code : 632-XXXX-XXX

Merits and Demerits of Codification

A rationalized system of codification helps in accurate identification, prevents duplication and reduces varieties. It also assists in recording, accounting, pricing and costing of materials. Locating and indexing for inspection are made simple. However, the demerits are that often codes are misunderstood, and when a mistake occurs, finding out the exact code is rendered difficult. Also when large numbers are coded in one group, this could lead to confusion.

Check Your Progress 3

Fill in the blanks:

a) The arrangement of materials should be planned to enable easy ....., ... pilferage, ... identification and ....

b) Layout of stores should be an ..... part of the hospital design.

c) Standardization ensures ..... in the varieties of items, thereby requiring lesser amount of .... commitment of the hospital.

d) Procurement lead time is ..... as a result of variety reduction.

e) Codification helps in ..... identification, ... duplication and ..... varieties.

1.7 MATERIALS ACCOUNTING AND PHYSICAL DISTRIBUTION LOGISTICS

1.7.1 Materials Accounting

The primary basis for Materials Accounting is cost. Materials are ordered on a continuous basis and there is no prescribed procedure which can be used in the determination of materials cost for accounting purposes. In order to determine the money value of materials on hand at a given point of time, the quality of the materials must be known, and a value must be assigned to those quantities based on one of the several accounting methods.

The records kept by the logistics department have two broad characteristics:

a) Only quantities are shown in the records; and

b) Regular balancing of materials is done.

For this purpose, the following records and documents are kept:

a) **Bin card:** It is a record of movement of materials against each kind of stock in respect of daily transactions, which is attached to each bin or shelf or any other form of containers. It shows daily receipts, issues and balance quantity on hand. The card also shows maximum and minimum and re-order levels.

b) **Stores ledger:** The stores ledger shows the details of the information of each item—i.e. supplier's name and address, quantity ordered, invoice number, price, expected delivery date and stock levels.

c) **Stock identification card:** These cards are kept against each bin/rack to identify the materials. It has the material code number, full description, stores ledger folio and bin-card numbers.

d) **Materials received note:** Materials after inspection are taken into stock through this document. It passes through the Inspection Department to Accounts Department for recording and accounting of materials.

e) **Materials requisition slip:** This document conveys the quantity required of the material from the issue counter. Stores department must ensure that the MR slip is signed by the authorized person, proper code number, and/or description of material is mentioned and the quantity issued must be entered and signed.

f) **Materials returned note:** When materials are not required by a department, these are returned to the stores with this note. Stock and stores records are adjusted accordingly.

g) **Materials transfer note:** Transfer of materials from one department to another is carried out on this note and stores account informed for necessary recording.

1.7.2 Flow of Goods

The flow of **goods** physically in the inventory is directly related to the financial characteristics of flow of **costs**. The flow of costs depends upon the method used, which in general use are as follows:

a) **FIFO method:** "First in, first out" method is in most common use. Materials from the oldest stock is issued, and their unit cost also represents the oldest cost on the stock ledger. However, when prices are subject to change, this method cannot match costs against revenue on a current cost basis.

b) **LIFO method:** "Last in, first out" method assumes that most current cost should be charged to the goods. This however results in unrealistic inventory valuation for the balance sheet.

c) **Average cost method:** This does not take into account which item went out of the inventory first or last, rather it determines the average cost for each item during a period of time.

d) **Specific cost method:** This provides the most realistic valuation of ending inventory as well as flow of costs. Costs flow and physical flow are identical under this method, with proper maintenance of records. It is suitable for physical verification of inventories made round the year.

1.7.3 Physical Distribution Logistics

An efficient distribution system includes:

a) Elimination or reduction of all unnecessary handling and movements.

b) Planning of stores distribution for overall economy.

c) Mechanization, wherever possible, and use of simplest equipment.

d) Standardization of handling equipment.

Distribution System

The distribution of stores may be Centralized or Decentralized according to the hospital management policy, and depending upon the storage location system, which may be as follows:

a) **Spot location system:** Whichever item fits in whichever place. It has the proper utilization of space, but has an admixture of items. Chances of pilferage are high.

b) **Sequence system:** The materials are sequentially arranged and are easy to locate. However, additional space is required for storage.

c) Popularity system: Items which are used more often and are in greater demand are readily available at convenient sites.

d) Size system: The bulky items are placed at distant locations and on lower floors, whilst the smaller items are more easily accessible at decentralized locations.

The physical **distribution system** in the hospitals is usually one of the following methods:

a) **Basket system:** Requisition note from the ward/department approved by the authorized signatory is received by the stores department, and items issued in totality on as required basis. Chances of misuse and pilferage in this system are higher. This system should usually be utilized in specialized departments.

b) **Topping up system or replenishment system:** Here the issues made by the stores are against the number of identified/accountable items utilized in case of disposable, or are exchanged on one-to-one basis in case of non-expendable items. Chances of pilferage are reduced, but there is no buffer/reserve stocks available with the ward/departments.

c) **Unit dose system:** In case of certain operations/procedures, certain identified items are issued as a "unit dose" or single item requirement by the stores.

The hospital management should bring out a "materials handling guidelines" for easy handling and distribution of stores. Some of the recommendations are as follows:

a) Materials should be kept generally at a level at which distribution is most convenient.

b) Materials should be placed on pallets, trays or platforms.

c) Distances for distribution should be as short as possible.

d) When distances are long, attempt should be made to handle as large a quantity as possible on each trip/issue, to cut down frequency of handling.

e) Straight flow layout is ideal.

f) Gravitational use must be encouraged.

g) Belt and roller conveyors should be utilized where load factor is high. Fork lifts/trucks help in facilitating movement of bins/containers/wire baskets.

h) Incoming materials should be received in a covered area, and in-process handling should preferably be in pallets or in suitable container, wherever direct transfer to the respective department is not possible.

Check Your Progress 4

Fill in the blanks:

a) Bin Card is a record of ..... against each kind of stock, on ..... transactions.

b) Stores ledger shows ..... of each item.

c) Materials requisition slip indicates ..... of material demanded.

d) FIFO is ....., ...

e) Large number of pick-up and delivery points affects ..... and ..... requirements adversely.

f) Basket distribution system is based on ..... basis.

1.8 TRANSPORTATION SYSTEM

1.8.1 Transport and Traffic Importance

Transportation and traffic often means the same thing to many people. Transportation is the management of the movement of goods and materials through space and time from their original source to the ultimate destination. Traffic considers only the techniques.

With the necessity of large scale supply of stores to the hospitals, transportation system has always exerted tremendous impact on the supporting activities associated with

marketing/supply of goods, and economic activity. Transportation influences the cost of supply of goods, and may even represent 20 to 40% of the total cost. Material characteristics as well as volume influences the transportation decisions. Its effectiveness, therefore, depends on the knowledge of alternative sources, rates, schedules, etc. The important aspects relate to the choice of mode of transport, route selection, rate verification, claims management for lost materials/damage and auditing.

1.8.2 Modes of Transport

a) **Water transport:** Shipping is generally considered in case of imports. It is the cheapest mode.

b) **Rail transport:** India has the foremost railway system in Asia. However this mode is preferable for raw material transportation, rather than for finished products. Rail transportation has its limitations as regards to time schedules, and freight building-up of a complete firm. However, there are some need based railway transport packages e.g. container service, quick transport service, freight forwarder scheme, and parcel express. Charges are twice that of shipping, but nearly half as compared to lorry transport.

c) **Post parcel:** Available between all essential points in the country, but carriage is limited to small packages and selected commodities only. Primary benefit is door-to-door delivery at relatively low cost.

Each mode of transport has varying service capabilities. The factors enumerated above affect the cost and pricing of transportation. The materials manager in the hospital weighs the various factors, keeping cost in the fore-front before contracting an order.

1.8.3 Miscellaneous

Responsibilities of Materials Manager: The important points to ponder over in this issue are:

a) Arranging adequate insurance cover for materials in transit, storage and warehouse.

b) Management of claims, if any in event of loss.

c) Minimization of annual insurance cost paid as premium.

An adequate insurance value is computed by adding the invoice value, freight charges payable, plus incidental charges and add on percentage to allow for likely increase in market value during total lead time involved. If the cargo is a total loss, the full insured value is collectable.

Open policy insurance: To simplify covering repetitive risks during transportation, a blanket or open cargo contract is resorted to. Under an open policy, an insured party may obtain continuous coverage for all shipments for an extended period of time or until cancelled by the other party. An open cargo policy covering general stores is usually written on "all risks" basis.

The term "marine insurance" is insurance of transit of materials by ocean voyage, air consignments and inland transit by road or other means of transport.

Third parties: These are companies similar to channel intermediaries that provide linkages between shippers and carriers. Often, third parties partner with a number of carriers who provide the necessary equipment to transport their shipments. There are several types of third parties, including transportation brokers, freight forwarders, third party logistics service providers, shippers' associations. With the increasing emphasis on supplies and management, more companies are exploring the third party option. These third party firms handle all or most of the freight offers and dedicated contract carriage.

Carrier pricing related issues: Pricing issues are important in transportation. Rates are developed in general or specific rates are determined by a carrier. These rates are followed by a description of the issues the specific rates carrier charges. The most significant approach is FOB (free-on-board) pricing. Also available are quantity discounts and allowances provided by the carrier to the buyer. The FOB pricing items that are offered have a significant impact on logistics generally and transportation specifically e.g. if a seller quotes a delivered price to the hospital's pharmacy stores at a distant location, the

total price includes not only the cost of the product, but also the cost of moving the product to the distant location store.

Check Your Progress 5

Fill in the blanks:

a) Water transport is the ..... mode of transportation, followed by rail transport which is nearly..... than shipping, but nearly half as compared to ..... transport. ..... transport is the costliest, but the .....

b) Open policy insurance gives ..... coverage for all shipments for an extended ....., or until ..... by either party.

1.9 SECURITY OF STORES

In almost all medical institutions, loss of fittings, linen, instruments, drugs, etc. is a big problem. Some of these losses occur in units which operate in limited hours. In a properly designed hospital, it should be possible for security personnel to lock certain sections, especially relating to stores area. Much of the pilferage is an inside affair. Insistence on all members of the staff having an identity badge, prominently displayed is a help.

Security implies prevention of pilferage and theft by employees, vendor's men and carrier representatives. It also means guarding the assets against burglary and dacoity.

The stores manager by virtue of being custodian of the stores, he is responsible for its security. Some security and safety considerations playing a crucial role are:

a) The security force or watch-and-ward staff should keep vigil throughout the day/night, not only in the stores area but in the entire premises of the organisation. The security staff must be carefully selected with high integrity and sufficient strength. They should be trained in all aspects of security and security checks, and should be headed by a capable officer. The appointment conditions should indicate that these personnel must not be/nor become members of hospital unions or indulge in undisciplined activities. Rotations of shift timings must be worked out, with appropriate handing over overlap.

b) All storage areas are to have proper locking arrangements and periodic checks must be carried out.

c) Personnel entering the stores must be informed that the security staff will check or search them while leaving. The security staff must forbid unauthorized entry or exit of persons.

d) Receipt or disposal of materials should be checked by security personnel for authorized documents like invoice/gatepass etc.

e) The stores premises should be properly fenced, or have high walls or efficient locking devices, depending on the type of storehouse and design of the hospital. Burglar alarms and video cameras are aided assets these days. Powerful lighting must be provided at all strategic areas with automatic switchover to battery lights in the event of power failure.

f) The hospital formulary i.e. variety of items stocked should be reduced.

g) Strict inventory control measures to be enforced, with regular checks.

h) Labeling of containers, linen, furniture, etc. so as to exhibit distinguishing marks of the institution.

i) Indent forms should be printed, not hand-written. Quantity indicated should be in figures and words.

The above guidelines should be written as policies or standing policies or standing operating procedures (SOPs), and circulated to all wards/departments so that all the hospital employees are aware of the same. Appropriate sign-posting cautioning visitors and patients regarding security measures must be exhibited.

Fill in the blanks:

a) In most medical institutions, pilferage is an ..... Identity badges displayed is a .....

b) The security personnel must not be part of .....

c) ..... of hospital formulary ..... changes of pilferage.

1.10 CONDEMNATION AND DISPOSAL OF STORES

1.10.1 Introduction

One of the important areas of materials management is that a hospital must look into the identification and disposal of scrap, surplus, recyclable or obsolete materials. This area has been coined as "Reverse Logistics", and is gaining significant importance because of increased public awareness of the environment, more stringent government legislation, and a better recognition of the opportunities it offers in return.

1.10.2 Obsolete Materials

Obsolescence, particularly technological, is well known especially in the field of electronics. Presence of obsolete items cannot be eliminated but can be controlled by better planning.

Obsolete materials are often those items which are not required at all due to changes in design or model. These materials have economic value for which the need no longer exists. These materials, no longer useful for current needs or anticipated future requirements, nor usable elsewhere in the institution, find a place in stores adding onto valuable storage place and adding to costs. Sometimes, because of the high value of materials, managers are unwilling to authorize their disposal. Disposal is necessary, when it is established as a fact that their holding cost is a real loss to the organisation. Frequent reports should be made by all wards/departments to the stores manager with recommendations for disposal of such obsolete items.

A follow-up procedure should be established so that materials department can negotiate, and expedite disposals and removal of the materials from stocks, either by selling, junking or otherwise. This entails disposal of assets of the hospital, and management must approve of the disposal within the guidelines framed for such purpose.

Identification of Obsolete Items

The stores manager or the hospital administrator has to periodically analyze the movement of items and classify them as fast-moving, slow-moving and non-moving depending on the frequency of the issue from the store. The non-moving items are subjected to the XYZ inventory value analysis. The few "x" items (about 20%) account for the bulk or about 80% of the inventory value, and the large number of "z" items account for a trivial inventory value of about 20%. This list of "x" and non-moving items is circulated to all departments for their opinion and likelihood of usage, before pending them up for disposal. All pending orders for "x" category and non-moving items are correspondingly cancelled.

Reasons for Obsolescence

a) Sudden introduction of new technology, rationalization and design changes, without adequate preparation or planning.

b) Adoption of standardization, elimination of non-standard varieties and introduction of cost-reduction methods, have led to obsolescence of certain categories of items.

c) Initial procurement of spare parts based on supplier's recommendations, leads to dumping of slow-moving/non-moving parts, leading to obsolescence.

d) Cannibalization of spare parts to feed other equipment could lead to obsolescence of denuded equipment.

e) Overstocking of spares present to prevent stock-outs contributes to obsolescent behaviour.

f) Faulty forecast, bulk purchases, faulty store-keeping, improper codification, poor materials handling etc. contributes to obsolescence.

1.10.3 Surplus Materials

Surplus items are those materials which have no immediate use but have accumulated due to faulty planning, forecasting and purchasing. Surplus stock results from overordering and significantly contribute to the quantity of obsolescent and dormant stock, if stored over a period of time.

Surplus is also the state of an item when the stock is likely to last longer than a reasonable period or when it is no longer required for the job for which it was purchased, but the material is in good condition. If the management discards the surplus materials, the inventory turnover will increase but profit will dwindle for the period. The decision to retain or salvage such surplus materials must be based on a cost-benefit ratio. In deciding to discard surplus materials, usually some arbitrary rule is applied. Materials which are not moving for two or three years are declared as surpluses.

1.10.4 Scrap or Process Waste

Scrap or process wastes are defectives which cannot be used in their present condition. Defectives can be re-worked, but the cost of such rework may be uneconomic. It may be more economical to salvage these and get the best value by discarding. Here also, materials control must use the facilities provided by the purchase manager by acting as a coordinator in order that scrap is sold for best value.

1.10.5 Condemnation and Disposal

The above three areas viz. obsolete items, surplus stores and scrap are problematic in materials management, since they are cost-points without any return on investments.

The above items are to be identified, inventory prepared, approved by management, and put up for condemnation, followed by disposal.

Delay in disposing of redundant stock increases the inventory carrying cost, and also creates the risk of deterioration and loss of sale value of the stock.

Before disposal is planned for, a minimum value, to be approved by finance, should be fixed to avoid future audit queries.

Obsolete items should be disfigured before disposal, so that the same item in a new packaging, is not re-purchased by the hospital.

Disposal is effected by:

a) Inviting offers from time to time from possible sources.

b) Entering into annual contracts, and

c) Public auction.

It is necessary to associate the finance and user departments in the process of realizing the highest value from the items being disposed.

Check Your Progress 7

Fill in the blanks:

a) Reverse Logistics involves ..... and ..... of scrap, ... and obsolete materials.

b) Surplus stock results from ..... and contributes towards the quantity of ..... dormant stock.

c) Recommendations for disposal of items must be received from the ...../ .....

d) Surplus is the state of items when stock are likely to last ..... reasonable period.

e) Condemnation of item is approved by .....

f) Disposal is preceded by a ..... value of the item, and is usually effected by ..... auction.

1.11 HOSPITAL STORES

Hospitals are consumers of a great variety of goods; and the problems of storage, inventory, and distribution of these goods are of great importance. Supplies are most often stored and distributed from the department concerned. This is especially so, when the quantity remains small and corresponds to a few days of consumption pattern. However, when the bulk of these goods is great, it becomes necessary to keep them in a central store.

In economically developed countries, where the network of trade centre is highly organized, it is generally not necessary to keep a large amount of goods in the hospital stores, because the suppliers or retail departments are able to provide the hospitals, in a matter of hours, with a great number of items upon a telephonic call. On the other hand, in a developing country or even in a remotely placed town/city in India, if a reliable medical supplies industry is not available; then the health services are dependant upon imports and bulk purchase of items.

The potential hospital administrators must weigh these aspects during planning and forecasting, before placement of the requisite quantity of orders.

It is imperative that a sound administrator must deal with the problem of medical supplies. The chief official must have knowledge and experience in handling of medical supplies. He/ She must have experience in business. It is not necessary that he should have a scientific speciality e.g. speciality of pharmacy is not necessary to fill the post of director of medical supplies, nor this official needs to be a medical practitioner. Basically, he must have a record of successful management in the field. Yet again, a scientific or medical background is an added asset.

1.11.1 Types

Hospital is an industry, has hotel management techniques, and is a health care institution, with a variety of services being rendered and departments being catered for. The types of hospital stores include:

a) Pharmacy services or drug stores
b) Medical equipment (expendable and non-expendable)
c) Bio-medical specialized equipment
d) Laundry services stores include linen (for hospital and staff)
e) Housekeeping services stores
f) Dietary services and kitchen stores
g) Hospital furniture stores
h) Stationery and office equipment stores
i) Hospital vehicles stores
j) Machinery, gas, electrical stores
k) General non-specific stores for other sundry items.

When planning for the hospital stores, these areas should be carefully demarcated, and duties, areas of responsibilities and policies of each sub-division identified.

In this unit, the students will be given a resume on Pharmacy or Drugs services and allied stores affiliated with it e.g. laboratory chemicals, X-ray films and chemicals, gases, etc.

The other type of stores including bio-medical and other medical equipment are being explained in the other units. The endeavour is to generally explain the management principles of any type of logistic stores.

1.11.2 Pharmacy Services

Pharmacy service plays a very important role in patient care. It has to ensure a constant supply of good standard of drugs for the treatment of patients at economical price. Pharmacy in OPD is generally the last place to be visited by the patients coming to the out-patient department, and when they reach there, they are in a tired state, it is natural for them

to expect quick service from the pharmacy. Likewise, availability and issue of drugs for the in-patients admitted in the hospital wards has to be carried out, on as per demand of each department, to bring total efficiency in patient care.

Definition : The hospital pharmacy may be defined as a department which deals with all aspects of drugs except prescribing and administration of drugs, which are exclusive rights of physician and nurses respectively.

Role and Function: The services rendered by the hospital pharmacy can be categorised as:

a) Demand estimation according to formulary; and in the absence of formulary, establishment of specification for drug procurement.

b) Purchasing of stores.

c) Storage and distribution of drugs to in-patients (wards), and dispensing for out-patients.

d) Compounding and manufacturing of sterile and non-sterile products, in some specialized institutions.

e) Quality control of drugs purchased, compounded and manufactured in the pharmacy.

f) Maintenance of formulary system, and implementation of the decisions of the Pharmacy and Therapeutic Committee.

g) Furnishing drugs information to physicians and other professional staff.

h) Control of medical gases services, including piped gases.

i) Maintenance of the facilities of the department.

j) Imparting training to students of school of nursing, and in the medical intern training programme.

k) Preparation and submission of periodic reports on progress of department to the hospital administrator.

Pharmacy and Therapeutics Committee

The pharmacist-in-charge is the member secretary of the Committee, and the members are chosen from the various divisions of the medical staff. The Committee should hold at least two regular meetings annually, and additional meetings as deemed necessary. The purpose of the committee shall be:

a) To develop a formulary of accepted drugs for use in a hospital.

b) To serve as an advisory group on matters pertaining to choice of drugs for stocking.

c) To evaluate clinical data concerning drugs requested for use in the hospital.

d) To add/delete drugs for use in the hospital.

e) To prevent unnecessary duplication of same basic drugs and its preparation in the stock.

f) To make recommendations concerning drugs to be stocked on the nursing units and other services.

1.11.3 Stores Management – Organisation and Staffing

Organisation

The hospital administrator should verify the qualifications of the pharmacists and their registration status with the respective board. The number of pharmacists and staff to be employed in the department varies according to the size and commitment policies of the hospitals.

Duties

The prime duty of the hospital pharmacist is to render good service to the patient. This is achievable by providing medications of the highest standards, promptly available and at reasonable expense. The pharmacist also renders a valuable professional service to the medical staff. This is feasible through regular communication between the staff and pharmacist. The latter is a source of information on merits of different brands of the same basic drug, and could advise on the dosage and strength of innumerable new preparations being marketed today. The pharmacist contributes to the education of nurses in the uses,

actions and dosage of drugs, control of narcotics, proper care of perishable items, and labeling and filling of bottles and containers. A well-organized pharmacy under an efficient pharmacist can prove to be a revenue-producing department, even in small hospitals. The medication cost per patient is reduced by proper management, despite the profitability. An exception to this may be made on the ordinary drugs stocked in the floor medicine cabinets which are often dispersed without charge to the patients. Erroneous medication should be viewed seriously, which are detrimental to patient care and is an economic loss.

Staffing Pattern

This is dependant on the work load i.e. number of items to be served per prescription and hours of service to be given. Further, the number of pharmacists required varies with the programme, policies, responsibilities, services and their utilization for in-patients, out-patients, employees and the public. The workload consists of measurable activities and quantifiable load. Generally, each category of activity requires about one-half of the time of the pharmacist. More readily measured items include filling of prescriptions, issues to patient care areas, including out-patients, compounding and pre-packaging.

On an average, in a 8-hour shift of OPD Pharmacy, a pharmacist can serve 150 prescriptions with a half-hour break. If the items are 3 to 5, then limit to serve will be reduced to 120 prescriptions in one shift. Hospital having more than 200 beds needs a Head Pharmacist, and for more than 300 beds requires one additional Asst. Pharmacist.

Studies in India indicate certain guidelines for the staffing pattern of Pharmacy Service, based on the number of beds in a hospital. These are as follows:

Bed Complement	Number of Pharmacist
Up to 50	3
" 100	5
" 200	8
" 300	10
" 500	15

It is imperative that the personnel department must create scope of promotion avenues to keep the workers motivated amongst the different services/departments.

Supervision and Control

Drug stocks in nursing units should be standardized and kept at a useful minimum level. This should be inspected by the pharmacist, with the nursing supervisor, every month. Old and deteriorated medication are to be removed; unopened original packages may be returnable to the vendor for credit. Containers and labels in poor condition to be replaced. Excess stocking to be curtailed. Some hospital pharmacies work with as two-unit container system, which provides for a full container remaining on the ward floor while an empty container is in the pharmacy being refilled. The Head Pharmacist must process managerial skills, so as to guide the performance of the subordinates towards a common goal.

Purchase and Supplies

The pharmacist's principal function in purchasing is to establish standards and specifications for medication and equipment. He/She alone is responsible for sub-standard or dangerous items reaching the patient. The pharmacist is familiar with the pharmaceutical and chemical manufacturers, their distribution system and discounts. A sound purchase and control system is essential.

Purchase card for each item stocked in pharmacy must indicate date, quantity and price, which will assist in reordering of that product in the requisite quantity. Quantity discounts may be taken advantage of, dependant on business conditions, and over-stocking should be prevented.

Inventory should be worked out on annual basis to further improve efficiency, but it is amply simplified when a purchase record system is already installed. Purchase of drugs and pharmaceuticals should be on a bid basis where practicable.

Manufacturing

In some institutions, manufacturing selective preparations could be profitable and convenient. This includes alcoholic preparations such as elixirs and tinctures, made from tax-free alcohols.

Pharmaceutical Services in Small Hospitals

Rendering quality of care is the same in all hospitals, regardless of size or services. However, hospitals with less than 100 beds, have pharmaceutical services of smaller volume which may not warranty use of full-time registered pharmacist. These are alternatives suggested for such situations. They may be utilized in addition for general administration, such as purchasing. Also, in professional medical fields like laboratory, X-ray services, or supervision of central sterilizing and supply services, pharmacists can be gainfully utilized. He may even be utilized for pharmacy services in two or more small hospitals, if the distances between them are nearby.

These methods which may appear to be feasible locally should be fully explored by the small hospitals.

1.11.4 Physical Facilities of Pharmacy

Location: Wherever feasible, the pharmacy should be located on the first floor of the hospital and readily accessible to lifts to ensure adequate and efficient service to the various nursing stations and departments. In case of out-patients department the pharmacy or a branch thereof, should be located conveniently nearer to it. Space should be provided in the OPD, for seating of patients awaiting issue of medicines.

Floor area: The total area for efficient pharmacy services varies with the layout and service of the hospital, utilization pattern and workload. However, the minimum need for any sized hospital is 27 square meters. From that point basic estimates range from 1.0 square meter per bed in 100-bed hospital; 0.6 square meter per bed in 200-bed institution; and an average of at least 0.5 square meter per bed in larger hospitals. Teaching hospitals require much larger space.

Finishes and lighting: The floors of the pharmacy should be resilient, smooth, easily cleaned and acid resistant. Rubber or asphalt tiles and heavy linoleum are satisfactory material. Walls should have a smooth surface with painted or equally washable finish in light colour. The finish of cabinets and similar items should be light-coloured wood or white enameled. Good lighting and ventilation are imperative. Venetian window blinds could be fitted onto windows, to provide maximum benefit of daylight without glare. In addition to general illumination, fluorescent lamps should be placed immediately above the prescription counter where necessary to assure adequate light. Ample electrical outlets should be provided for in all areas.

Equipment: Equipment lists will be at variance to cater for design and services of individual hospitals. Equipment includes drug stock cabinets with proper shelving and drawers for a large assortment of drugs. Sectional drawer cabinets are ideal to fit into any area. Work tables or counters are required for manufacturing solutions, powers, ointments and for filtering; also for loading of word baskets and checking orders. Counters with drawers has the advantage of providing more storage space. Standard counter height is 0.9 meters, depth 0.75 meters and minimum length of 1.8 meters. The finish of the work top may be acid resistant or of heavy linoleum.

Also necessary are an acid-proof sink with swivel tap and drain board, with a cabinet below to provide space for glass equipment. Refrigerator is a must, especially for stocking items necessitating storage at low temperatures. Space required is variable, but generally at least 0.2 cubic meters (8 cubic feet) in 50-bed hospital, 0.4 cubic meters (16 cubic feet) in 100-bed hospital, and 0.8 cubic meters (32 cubic feet) in 200-bed hospital.

A "cool-room" temperature controlled by air-conditioning is also necessary for storage of antibiotics. Office furniture, computers, communication facilities like telephone and intercoms, file cabinets for records and manufacturers current literature, cord index file system and pharmaceutical library are also to be catered for. Dispensing window/s is a must through which prescriptions are dispensed to out-patients and ward staff/nurses.

General storage: The ideal area for bulk pharmacy stores would be adjacent to the pharmacy itself. However, this may often not be feasible. The next choice would be directly below the pharmacy with dumb-waiters and special staircase connection. Bulk pharmacy stores should be kept with the general stores area, and must have an access enclosure for the pharmacy staff.

Equipment required would be open adjustable metal shelving for reserve stock, raw material, empty bottles, and packaging containers. Separate lockable fireproof room with drum cradle is necessary for alcohol storage.

Check Your Progress 8

Fill in the blanks:

a) In a developing country, reliable medical supplies industry is a must. If not available, then we are dependant upon .....

b) A sound hospital administrator must have a record of ..... in the field of hospital stores.

c) Pharmacy is a department dealing with all aspects of .....

d) Pharmaceutical services caters for ..... and also ..... patients department.

e) The head pharmacist is a member secretary of .....

f) A qualified pharmacist must be ..... with the respective board.

g) A well-organised pharmacy can be ..... producing for the hospital.

1.12 LET US SUM UP

In this unit you have been given the outlines of Logistics Management. We have exposed you to the general principles and functions of logistics management. Planning and coordination of various activities relating to materials planning and purchases have been brought out in the unit. The procedures involved in the tendering process, procurement and inspection, including quality assurance have been explained. The storage system, standardization methods and codification of stores have being outlined. The methods of distribution of stores, accounting of materials, and security of stores, have been touched upon briefly. The various types of transportation of stores have been pointed out. Finally, identification of stores for condemnation and disposal have been explained.

The students should be able to identify the management techniques outlined and aptly apply the same in their respective medical institutions, as managers/hospital administrators. The hospital stores, with detailed reference to the pharmacy service, its organisation, staffing pattern and physical facilities have been illustrated so that the students could utilize the knowledge in their perspective planning.

1.13 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) a) Obtain materials at the lowest possible price, which must go hand in hand with consistency in both quality and continuity of supply.

   b) Maintain the minimum of inventory of materials so as to free the working capital for other useful purposes.

   c) All activities should be carried out at a minimum of cost.

2) Right item/material, right quantity, right price, right source, right delivery time, right methods/systems and right people/attitude.

3) a) optimum level; right time

   b) working capital

   c) identifying items of common usage

Check Your Progress 2

a) actual buying of materials

   purchasing, traffic, warehousing/storage, etc.

b) to ensure uninterrupted flow

c) quality, delivery schedule, business ethics, promptness; competitive bids.

d) governmental; public sector undertaking

e) rate; minimum quantity

f) discussion; buyer and seller; an agreement
g) buyer and seller
h) Bureau of Indian Standards
i) accuracy

Check Your Progress 3

a) storage, minimize; proper; quick retrieval
b) integral
c) reduction; working capital
d) reduced
e) accurate; prevents; reduces

Check Your Progress 4

a) movement of materials; daily
b) details
c) quantity
d) first in, first out
e) manpower; equipment
f) as required

Check Your Progress 5

a) cheapest; double; road; air; fastest
b) continuous; period of time; cancelled

Check Your Progress 6

a) inside affair; help
b) hospital unions
c) Reduction; diminishes

Check Your Progress 7

a) identification, disposal, surplus
b) overordering, obsolescent
c) wards/departments
d) longer than a
e) management
f) minimum, public

Check Your Progress 8

a) import
b) successful management
c) drugs
d) inpatients; outpatients
e) Pharmacy and Therapeutic Committee
f) registered
g) revenue.

UNIT 2 INVENTORY CONTROL

Structure

2.0 OBJECTIVES

After going through this unit, you should be able to:

- define Inventory Control;
- describe aims and objectives of Inventory Control;
- enumerate various classifications of Inventory;
- discuss functions of Inventory and Criteria of Inventory Control;
- describe tools and techniques of Inventory Control.

2.1 INTRODUCTION

In this unit you will learn, what is inventory control and how this is applied effectively in various aspects of materials management particularly when you are dealing with the various consumable items like, drugs, vaccines, gauge-cotton and other disposable items in your daily use in a hospital. Also you shall learn how these consumable items can be scientifically classified and we can have a better control over these items and the drugs/ materials are available whenever required and wherever required.

In financial parlance, inventory is defined as the sum of the value of raw materials, fuels and lubricants, spare parts, maintenance consumables, semi-processed materials and finished goods stock at any given point of time. The operational definition of inventory would be: the amount of raw materials, fuel and lubricants, spare parts and semi-processed material to be stocked for the smooth running of the plant. Since these resources are idle when kept in the stores, inventory is defined as an idle resource of any kind having an economic value. Hence in simpler terms inventory may be defined as list or stock of items in store, which one can count, measure or weigh.

Inventory control is a scientific process by which an organisation is supplied with the goods and services, that it needs to achieve its objectives at optimum cost. Inventory control can be viewed as the attainment of a cost balance between shortage and excess of stock. It is one of the modern management techniques of operations research.

Without proper control over the inventory, serious problems can precipitate, related to manufacturing, marketing, revenue generation and customer satisfaction. Likewise, availability of life saving drugs and other hospital supplies can be crucial to good hospital care and patient satisfaction.

...ntrol means stocking adequate number and kind of stores so that the ...required. This has to be done

at any optimum outlay of financial and human resources. High inventory level lead to high cost of inventories by – a) blocking the finances; b) large storage space; c) large handling and administration charges; d) obsolescence; and e) spoilage etc. On the contrary, low inventories may led to frequent stock outs and high shortage costs. Balancing the cost of carrying high inventories and the cost of shortage is done through a system of scientific inventory control.

Materials management and inventory problems are common to all organisations. The importance of effective materials supplies was first recognized by the profit making industrial sector. Gradually, service organizations like educational institutions, hospitals, etc., realized the value of managing their material supply system on scientific lines. Hospitals require a variety of materials and supplies, which are essential in providing good patient care. These supplies have to be obtained at most economical rates in right quantity and right quality at right time. Effective management of these supplies is possible through the scientific system of materials management.

The goal of a good hospital supply system is to ensure that there is adequate stock of required items, so that an uninterrupted supply of all essential items is maintained taking due care, we do not overstock the supplies which not only locks up the capital, but also gives room to pilferage and obsolescence. We should also ensure that these items are properly stored, controlled, made retrievable and distributed to the points of usage.

2.2 AIMS AND OBJECTIVES OF INVENTORY CONTROL

Inventory Control deals with physical control of inventories. It is the process/techniques of deciding as to when, what and how much of each item is to be kept in stock, minimizing the ineffective stock and optimising the various costs associated with the inventories.

Objectives of Inventory Control are to:

1) maintain availability of materials whenever and wherever required in optimal quantity.
2) minimize the ineffective stock.
3) optimize the various costs associated with inventories.

The basic principle of inventory control is also to contain costs. There are four types of costs involved in the management of material supplies as described earlier. The purchase cost is the direct cost of the material, which is inclusive of taxes and freight. We can reduce this cost without compromising with the quality of the supplies. The techniques followed are bulk buying, rate contract, and combined buying, negotiating purchase prices by assuring long-term business. The carrying cost which consists of costs incurred on money invested storage space, additional manpower, obsolescence, deterioration, breakage and pilferage is difficult to calculate.

It can be generally about 30% of the actual cost of inventory. To control this cost we have to strike a balance between purchase cost and carrying cost by procuring the items in optimum quantity, known as the economic order quantity which is discussed later in this unit. The shortage cost covers the loss of hospital revenue due to the non-availability of critical items other than the extra cost, which has to be paid to procure this item from an alternate source. To contain this cost it is advisable to have two to three suppliers of good reputation for all the critical and vital items. The ordering costs both direct and indirect will go up with more frequent orders. The technique to control this cost is again by effecting economy in materials management:

i) Purchase Costs
ii) Carrying Costs
iii) Shortage Cost
iv) Ordering Cost

Economics

Control of Inventory is an important aspect of Materials Management. If the level of inventory goes up, the carrying costs

the other hand, if we have a smaller inventory, turnover is greater requiring less carrying charge but more of ordering costs, as orders have to be repeated more often. We have to strike a balance between these two costs. By inventory control we can find out optimum quantity to be stocked so that these costs are kept at the minimum. It is necessary to understand the apparent costs and the hidden costs in the management of the supplies.

Purchase Cost

It is the actual cost of the materials whether it is drugs, chemicals, linen or other stores. It is an apparent type of cost, which is easily understood by all. The aim is to reduce this cost without compromising with the quality of suplies, say drugs. The effort should be to reduce this as much as possible by following the simple techniques like 'bulk-buying', buying under generic names and **Not Trade Names** and at negotiated rates by assuring future business over a reasonable period. While having discussions with a General Manager of a large Indian Drugs Public Sector Undertaking, the author was told that the GM shall be very happy to give substantial discount [up to 25 per cent] over and above the hospital, rates if purchased in bulk quantities. But there are some inherent problems, which are associated with bulk purchasing i.e. it may lead to huge stocks/inventory, which in turn increases the 'carrying cost'.

Carrying Costs

This is hidden cost and not amenable to easy calculation. The cost of carrying an inventory can be large if one is not conscious of its implications. Carrying costs are composed of the following elements:

a) Cost of using or borrowing money
b) Cost of storage space
c) Cost of additional manpower
d) Cost of obsolescence
e) Cost of deterioration
f) Cost of pilferage, breakage

Taxes and insurance premiums may add to the above list. Most of these costs can be described as invisible costs. Invisible because they may not reflect in the drugs store budget but add on to the overall budget of the hospital.

Let us discuss in brief about the aforesaid elements of the carrying cost:

a) **Cost of money:** When we purchase the drugs in bulk, we pay also large proportion of the drug budget at one time. Imagine if you were to borrow this money from a financier how much interest would accrue to the hospital. You can look at it in a different way also. An efficient stores manager instead of purchasing in bulk would divide it into small portions and stagger the supply at a quarterly/monthly interval and release the payment only for that small portion received.

b) **Cost of space:** If the annual requirements of drugs were purchased in bulk, additional space/store rooms with fittings and furniture would be required. This would mean additional expenditure.

c) **Cost of additional manpower:** More the material more hands to deal with it. This means more storekeepers/pharmacists, clerks, orderlies etc. Their salaries/wages would add up to the cost.

d) **Cost of obsolescence:** Drugs also go out of fashion. If a drug's annual requirement in toto is purchased in bulk and right at the beginning of the year, there is every likelihood that a better/newer alternative arrives in the market. As and when it happens the demand or prescriptions for the old drug purchased in bulk will either cease or reduce considerably. It happens more often than not. Such dead stocks of medicines are a net loss to the hospital.

e) **Cost of deterioration:** Drugs are sensitive and thermolabile items. When purchased in bulk they are likely to be stored for a very long period and get exposed to hot, humid and hostile weather and storage conditions. This may lead to disintegration, colour changes, growth of fungus in glucose-saline bottles etc. That is, we are not getting the right value for our investment.

f) **Cost of pilferage:** Pilferage is directly related to the level of stock/inventory of a drug. A large stock of a drug (following bulk purchase) will result into more pilferage and vice versa.

Conservative estimates are that the carrying cost may be 25 per cent to 35 per cent of the actual inventory cost. As managers we have to be acutely aware of the carrying cost.

To reduce this cost one should buy in small quantity. But this may increase the purchase cost. The purchase cost and the carrying cost oppose each other. But there is a point/ quantity at which both are minimum/optimum. This quantity is known as economic order quantity (EOQ).

Ordering Costs

It is the cost of placing an order like cost involved in stationery, postage, telephone, fax, manpower etc. This apparently is simple but can assume higher proportions because of the costs on manpower.

Shortage Cost

It deals with the cost of not having a particular material. The direct cost is the higher price we pay for procuring a substitute from an alternate source. The indirect costs in this element are related to the business that we loose, and public criticism etc. For example, you are suddenly told that oxygen is out of stock in the hospital. The functioning of the operation theatre and other sensitive areas of the hospital will be seriously disrupted. The patients will suffer and there will be a public criticism. Arrangements will have to be made to procure oxygen or for that matter another such vital drug, at a premium from market thereby, increasing the cost. On the other hand if tablets B complex, antacid or cough syrup is out of stock hardly anything will happen. Therefore, the shortage cost would vary according to the nature of an item.

2.3 CLASSIFICATION OF INVENTORY

For the better management of inventory one must classify the inventory so that the control of the inventory becomes much more easier and effective. The basic principle of the classification of inventory is based on **Paretos Law**. Pareto a German Economist while studying the income pattern of a given city, found out that 20% of the people have got 80% of the total money and rest of the 80% of the people were having 20% of the money. This finding of Mr. Pareto is equally applicable to so many other spheres of life as well as in the classification of inventory management.

The types of selective inventory control are as follows:

1) ABC – Based on cost criteria i.e. annual consumption cost of the items
– Does not depend on unit price of the item

	–	Hence it is also know as always better control
2) VED	–	Vital, Essential, Desirable
	–	Based on importance, criticality and shortage cost of the item in terms of availability, function, specifications, source of supply, production process, storage etc.
	–	Commonly used for management of consumable items.
3) HML	–	High, Medium, Low
	–	Based on unit price
	–	Does not depend on consumption
4) SDE	–	Scarce, Difficult, Easy to obtain
	–	Based on purchasing terms with respect to availability
5) GOLF	–	Government Ordinary, Local and Foreign
	–	Based on source of supply from which material is procured
6) FSN	–	Fast moving, Slow moving and Non moving
	–	Based on issues from stores
7) XYZ	–	Based on the value of Inventory stored
8) SOS	–	Seasonal, Of seasonal
	–	Based on seasonal requirements

2.4 FUNCTIONS OF INVENTORY CONTROL AND CRITERIA OF INVENTORY CONTROL

The main functions of the Inventory Control are to have the optimal quantity of the items at any time and every time in all the service outlets. Inventory Control will ensure that there will be no stock outs whereas on the same time there should not be any overstocking.

The functions of the inventory control are mainly:

a) stocking of adequate amount, number and range of stores (or kind of stocks or materials) at all service outlet points;

b) provide maximum supply service consistent with maximum efficiency and optimum investment;

c) provide a cushion between the forecasted and actual demand for a material; and

d) gives optimal outlay of financial and human resources.

2.4.1 Needs/Necessity of Inventory Control

A good Inventory Control maintains availability of materials and also controls stock-out and under-stocking. Also by this we can ensure no idling of service providers and dis-satisfaction among the patients. The cost of not having the items sometimes is costlier than cost of having. This in long run improves the image of the Health Centre/Hospital.

On the same time good Inventory Management also controls over-stocking vis-a-vis minimize the ineffective stock. May be that is the reason that the business world says— Inventories are yard of business or the necessary evils as they drain out the company's profit.

A good Inventory Control will have a direct impact on the service provided by the Hospital/ Health Centres, as a result it will enhance the patients' satisfaction and better service conditions.

Inventory Control is also a necessary measure to control the various costs, which are discussed earlier. Larger is the Inventory greater are the problems with respect to investment, planning, procurement, handling, receiving, inspection, storage, distribution, accounting, deterioration, obsolescence, pilferage, damage, shelf life, theft etc. Other than those it also controls the costs arised due to changes in technology i.e. advent of newer drugs and antibiotics, changes in market situation, changes in line of treatments and changes in government policies for various health programmes time to time.

2.4.2 Scope of Inventory Control

An efficient Inventory Control system can:

a) Reduce costs

b) Improve service delivery

c) Increase return on investment

d) Improve liquidity

e) Improve service conditions

f) Increase efficiency of man and machine

g) And hence improve patients, satisfaction and goodwill of the Hospital in the Community.

2.4.3 Factors Involved in Determination of Inventory Policy

The basic questions asked in determination in Inventory Policy are what to order, when to order and how much to order.

1)	Requirement	–	Quantity in stock/in transit
		–	Quantity to be procured keeping in view the consumption pattern, fluctuation in demand and utilization
		–	Seasonal and peak requirements
2)	Lead Time	–	Internal and External Lead-time
3)	Cost Factors	–	Ordering cost
		–	Inventory carrying cost
		–	Under/Over stock cost
		–	Saving in transportation/quantity discounts
4)	Liquidity/Financial Position	–	This will decide capacity to buy and capacity to hold inventory
5)	Availability of Credit		
6)	Obsolescence	–	Change in design of Final Indent
		–	Change in design of Quantity of the item
		–	Advent of newer drugs and antibiotics
7)	Government Policies	–	Imported/channelised items
		–	Change in import duty/custom duty specially before the budget.
8)	Storage	–	Shelf life, inflammable, evaporation, deterioration, bulky items, air-conditioned environment to store etc.
9)	Patient Service Provider Relations	–	Smooth deliveries result in lower inventories
		–	Increase/decrease in quantity in peak/slump season or due to change in indent/consumption rate
10)	Marketing Conditions	–	Items easy to get yesterday may be difficult to get tomorrow and vice-versa

11) Other factors such as single source, multiple sources, proprietary items, location of source of supply, import substitution, make or buy decision etc.

2.4.4 How to Reduce Inventory

1) Fixing up maximum limit of inventory in terms of value.
2) Fixing up responsibility of controlling the inventories with one person preferably at Senior level reporting to top Management.
3) Meticulous materials planning and forecast.
4) A well designed and defined Inventory Control system.
5) Fixing up realistic Inventory levels i.e. maximum, minimum, reorder levels and safety stock Inventory levels should be fixed itemwise/location wise.
6) By reducing lead-time.
7) Adjustment in Inventory levels. Wherever called for Inventory levels should be adjusted as per changes in requirement/consumption, changes in market conditions etc.
8) Strict control on obsolete, slow moving and non-moving items.
9) Reducing the number of stock points.
10) Standardization and variety reduction.
11) Maintaining close co-ordination wth other user Deptts., Store, Quality Assurance, etc. and creating an awareness and positive attitude at all levels in all the Deptts. to reduce the Inventories. Push the idea that Inventories are cash.
12) Computerized the Inventory control system.
13) By improving the buyer seller relationship, selecting the right source of supply in terms of location, quantity/quality etc.

2.5 TOOLS AND TECHNIQUES OF INVENTORY CONTROL

Inventory control is basically a scientific system which indicates as to what to order, when to order, how much to order, how often to order so that the purchasing costs and storing costs are kept as low as possible. The two basic techniques of inventory control are ABC analysis and VED analysis.

2.5.1 Techniques of Inventory Control

ABC Analysis

It is based on cost criteria governed by Pareto's Law where a small number of items consume a big chunk of resources and vice-versa. The ABC principle which is generally applicable to any type of store states that:

- Around 10 per cent of the drugs/store material would cost 70% of the resources. (Group A)

- 20% of the drugs/store material generally consume 20% of resources (Group B).
- Remaining 70% of the drugs/store material would consume just about 10% of the resources (Group C).

The calculations will not be so exact and the range may vary by about 5 per cent.

Methodology for ABC analysis

i) Work out the annual consumption cost of each item/drug.

ii) The list of drugs or items should be arranged in descending value of their cost. The most expensive item is at the top followed by the next less expensive and the cheapest item which has consumed least amount will be at the bottom.

iii) The cumulative cost of the items is worked out on this list. The cumulative cost of the first item will represent its annual cost, whereas, the cumulative cost of the second item will be its annual cost plus the cumulative cost of the item above it. Similarly, that of the third item will be its own annual cost and the cumulative cost of first and second item. The cumulative cost of the last item will be the total annual expenditure on medical store. Refer Table 2.1 for further guidelines.

iv) The list is now ready for undertaking ABC analysis. Mark the figure close to 70% of the total expenditure. All items up to this figure will be A category items. This will be equivalent to only 10-15% of the total number of drugs. The interpretation – about 10% of the items cost as much as 70% of total budgetary expenditure.

v) The next figure to mark will be close to 90% of the total annual expenditure. The items between the two figures i.e., after the A category items and up to the figure close to 90% will be B category. These will be generally around 20% of all the items. The interpretation – about 20% of the items consume 20% of the total expenditure.

vi) The remaining items will be C category, which constitutes around 65-70% of the items. The interpretation – about 70% of the store items cost as little as 10% of the total expenditure.

Following is a convenient example to understand the exercise better in undertaking ABC analysis.

Let us imagine the medical store of a small hospital has 100 items on its inventory and the total annual expenditure is Rs. 10,00,000. The items can be arranged in the descending value of their annual cost in the following manner:

Table 2.1

S. No.	Name of the Items	Annual Consumption in Rs.	Cumulative Total in Rs.	Cumulative Percentage	Category
1)	Inj. Ampicillin	91,000	91,000	9.1	
2)	Inj. Ciprofloxacin	89,000	1,80,000	18	
3)	Inj. Dextrose 5% 540ml	83,000	2,63,000	26.3	
4)	Inj. Normal saline 540ml	81,000	3,44,000	34.4	
5)	Inj. Cefatoxim 1Gm	71,000	4,15,000	41.5	
6)	Inj. Streptokinase	65,000	4,80,000	48	
7)	Tab. Ciproflaxacin	63,000	5,43,000	54.3	
8)	Inj. Haemaccel iv	59,000	6,02,000	60.2	
9)	Fluothane	51,000	6,53,000	65.3	
10)	Inj. Dexamethasone 2ml	47,000	7,00,000	70	A (70%)
11)	–	–	–	–	
12)	–	–	–	–	
30)	Inj. Urograffin	–	9,00,000	90	B (20%)
100)	Acriflavine	300	10,00,000	100	C (10%)

Another method of doing ABC analysis is to pick up approximately first 10% of the items from the list arranged in descending order, which generally consume 70% of the expenditure. This is category A. The next 20% of the items in the list account for 20% of the total expenditure. This is category B. The remaining items (category C) constitute about 70% of the items which consume only 10% of the total expenditure. As mentioned earlier, the percentages will not be exactly identical and the variation may be up to 5%.

Following are the applied benefits of the practice of ABC analysis:

Table 2.2

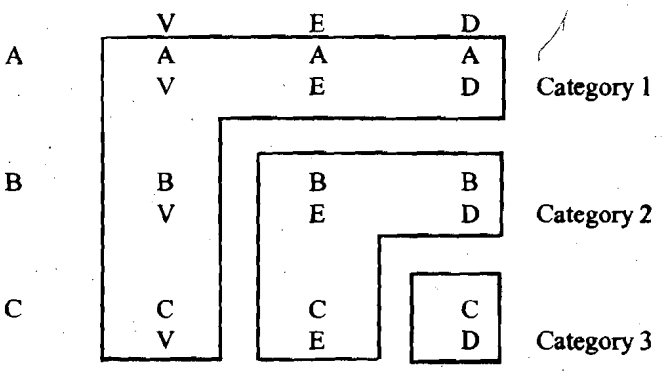
S. No.	Activity	Group A	Group B	Group C
1)	Frequent of Purchase	More Frequent	Less Frequent	Least Frequent
2)	Turnover/Consumption	High	Medium	Low
3)	Level of Control	Tight	Moderate	Routine
4)	Estimates of Requirement	Very Rigid	Rigid	Moderate
5)	Safety Stock	Low	Moderate	High
6)	Management Level	Top	Middle	Lower
7)	Monitoring	Very Strict	Strict	Moderate

VED Analysis

The limitation of ABC analysis is that it is based only on monetary value and the rate of consumption of the items. Sometimes, particularly in a hospital, and item of low monetary value and consumption (e.g. Injection Adrenaline, Anti-Snake Venom etc.,) may be very vital or even life saving. Their importance cannot be overlooked simply because they do not appear in A category of inventory. Therefore, another parameter of the materials is their "criticality". This could be in terms of the therapeutic value of a drug or intrinsic value of the material in achieving the objectives of hospital system. VED analysis is based on critical values and shortage costs of the item. Based on their criticality, the items could be classified into three categories: Vital, Essential and Desirable.

1) **Vital Items:** There are several vital items in the inventory of a hospital, which could make difference between life and death. There can be serious functional dislocation of patient care when such items are not available even for short period adversely effecting the image of the hospital. Such items should always be stocked in sufficient quantity to ensure their constant availability. Top management should control this group of items.
2) **Essential Items:** The shortage of such items can be tolerated for a short period. If these items are not available for a few days or a week, functioning of the hospital can be adversely affected (drugs like Antibiotics etc.). Top/middle level management should preferably control these items.
3) **Desirable Items:** The shortage of these items will not adversely affect the patient care or hospital functioning even if the shortage is prolonged (items like Vitamins). Middle/ lower level management should control desirable items.

As against the cost criteria in ABC analysis the VED analysis is based on subjective analysis by a group of physicians. Such an analysis enables the administrator to give more attention to vital and essential items. A combination of ABC and VED analysis can be gainfully employed to evolve a meaningful control over the material supplies particularly in a hospital system.



ABC and VED Analysis

Category I includes all vital and expensive items. These require close monitoring and strict control.

Category II covers items of essential category and they are less expensive.

Category III comprises the desirable and cheaper group of items.

SDE Analysis

This is based on the availability of items in the market. S items are scarce, D items are difficult to procure and E items are easily available in the market. Such an analysis may be handy when there is a lot of uncertainty or vagaries in the availability/procurement of the items.

Other types of analysis which are not of much significance to a materials manager are: HML analysis (based only on cost i.e., High, Medium, Low cost items) and FMS analysis based only on rate of movement/consumption (Fast, Medium and Slow moving items).

2.5.2 Types of Inventory Control System

There are two basic types of inventory control systems. Several modifications and improvements are based on these systems.

1) **The cyclical ordering system**

Based on the previous year's consumption patterns, the requirement is worked out for all the items. A fixed time base is worked out for ordering the supplies (once in a month, two months, or three months) and orders are repeated in the cyclical fashion. Although the system appears to be simple, some of the disadvantages are that it does not provide for unforeseen variations in the demand/consumption and the ordering quantities may not be economical with risk of overstocking or even going out of stock.

2) **Fixed order size system**

Also known as perpetual inventory system. Fixed number of units are ordered every time. The demand rate is constant but the time between the orders varies according to the fluctuations in use. When the stock reaches a predetermined level, fixed quantity of items is ordered. This system permits ordering the optimum quantity of each item required. Based on price, rate of usage, time taken to replace the stock, the maximum and minimum stock levels are worked out to establish the Reorder level. The ordering point is so fixed that by the time the supplies against the new order are received the stock level will fall to the minimum and when the fresh supplies are received, the stock will rise to the maximum level. This is also known as 'Min-Max' approach.

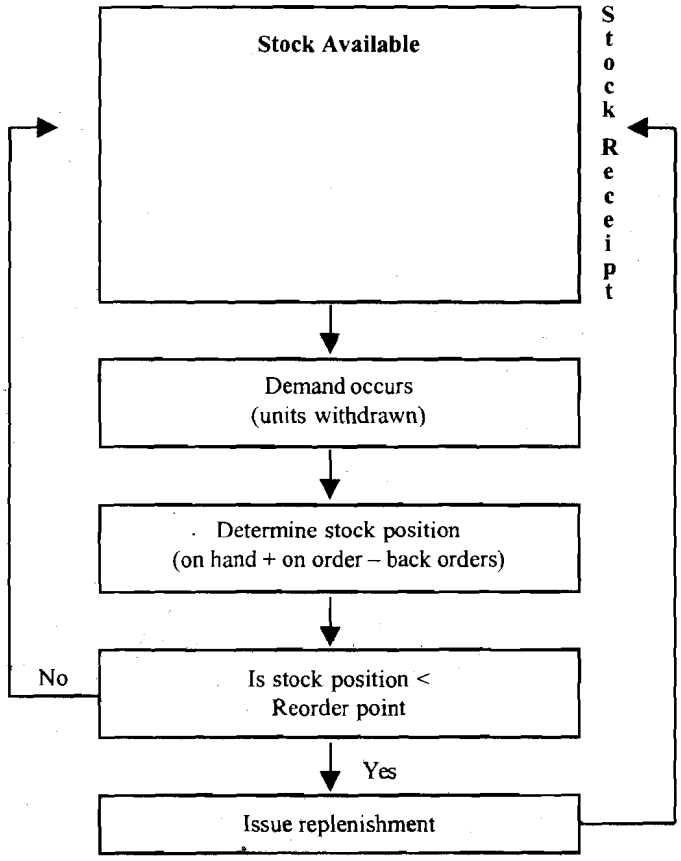
A discussion of the right quantity to purchase would not be complete without a brief summary of the "min/max" (minimum/maximum levels) approach to the "quality factor" as an alternative and comparison to the EOQ approach to quantity determination. Basically the "min/max" approach relies on the combination of two factors: (1) the order point, and (2) the total quantity to be ordered. Thus the order point is the minimum level and the combination of the order point and the total order quantity is the maximum level. The figures can be expressed in days, weeks, and months. A simple illustration of the formula is:

Minimum level	=	2 weeks
Maximum level	=	6 weeks
Supplier lead time	=	1 week
Order quantity	=	4 weeks

Therefore, in order to maintain a maximum level of six weeks supply, the order must be placed when the level on brand is at 3 weeks (one week supplier lead time plus 2 weeks minimum level); but the order must not exceed a four-week supply so that the maximum level will not be exceeded.

When recommendations for improvement are considered, it is impossible that they will exceed the resources available. In this situation, it is wise to develop a min-max strategy that identifies the minimum changes needed to environmentally improve the materials management system and the maximum changes needed to substantially improve performance.

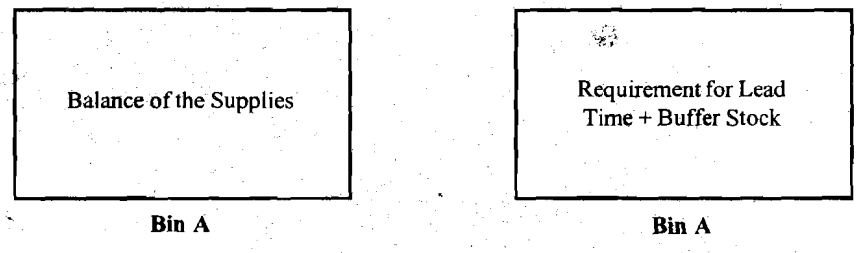
The advantage of the system is that each item can be procured in the most economic quantity. The constraints in this system are that it will function smoothly only when the lead-time (Procurement Time) and the consumption rate are constant. When these two factors are varying fresh reordering levels have to be calculated. Therefore, may be more cumbersome than the cyclical ordering system.



Fixed Order Size System

3) **Double bin or double shelf system**

This inventory control system is a modification of fixed quantity ordering system. Here, no perpetual inventory records are maintained. The stock of each item is kept in two bins or two shelves, one containing quantity equal to the reorder point and the other bin containing quantity equal to the difference between the reorder point and the maximum level. When the stock in the latter bin is used up, the storekeeper places fresh order before consuming the stock of first bin.



Double Bin System

To understand this system on simpler terms let us take a look at the system practiced by a housewife in the management of cooking gas. She acquires two cooking gas cylinders but uses only one at a given time. When one cylinder is exhausted she wastes no time in ordering a refill while connecting the second cylinder to the stove which sees her through till the fresh cylinder is delivered. There is no stock out nor any overstock.

None of the above systems are exclusive or foolproof, particularly when we cannot control the procurement time and the market availability of the items. The hospital requires a large number of material supplies constantly. It may be better to adopt Flow Control System for items required often in large quantities. The long-term contract is entered into with a reputed manufacturer/supplier for supplying a definite quantity of each item scheduled in intervals.

Other Useful Terminology

To grasp the inventory control system fully we have to understand the following terminology and formulae:

1) **Lead Time**

It is the length of time in days between the decision to replenish an item, and its actual addition to the stock. The lead time consists of internal element (time elapsing between decision making and communication of the order) and external element (time elapsing between the receipt of order by the supplier and actual receipt of the material). We can control internal lead time to an appreciable extent but will have no control over the external lead time.

2) **Buffer Stock**

Also known as Safety stock or Reserve stock. It is the minimum quantity of supplies set apart as an insurance against variations in supply and demand. This is greatly influenced by lead-time. This can be calculated by multiplying the average demand for maximum delay or the probable delay. The probable delay (D) is estimated from the past experience and graded as D1 (Least delay), D2 (mean delay), and D3 (maximum delay). If the lead-time requirement is R, the buffer stock (BS) can be calculated by using a formula: BS=D × R. If the item is very critical, value of D3 is taken into consideration to ensure almost 100% availability. The rule of thumb is to calculate the difference between maximum lead-time and average lead-time in days and multiply it by average daily consumption.

There is another method of calculating the Buffer Stock. As we know the buffer stock is the quantity of stores/cushion set apart as an insurance against stock outs. This quantity is kept as an emergency supply. It can be calculated by the following formula:

Buffer Stock = K × D

K = A constant and has three values i.e. K1, K2 and K3.
D = Average estimated consumption during the lead-time. Value of K will change according to the shortage cost or criticality of an item or how vital an item is.

The average estimated consumption during lead-time (D) can be multiplied by K1, K2 or K3.

A buffer stock of :

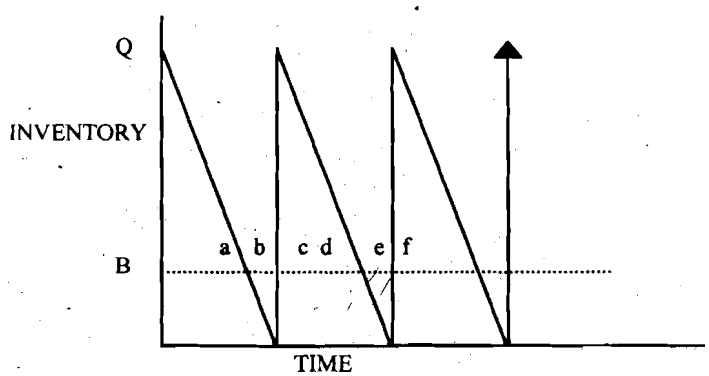
K1 × D will ensure that the drug is available 67 per cent of times when indented from stores.

K2 × D will ensure that the drug is available 95 per cent of times.

K3 × D will ensure that the drug will be almost always (99 per cent) available in stores whenever indented.

The average estimated consumption during lead-time (D) can be multiplied by K1, K2 or K3.
A buffer stock of:

K1 × D will ensure that the drug is available 67 per cent of times when indented from stores.
K2 × D will ensure that the drug is available 95 per cent of times
K3 × D will ensure that the drug will be almost always (99 per cent) available in stores whenever indented.



Key: Q = lot size; Q/2 = average inventory
B = reorder point;
ac = ce = interval between orders;
ab = cd = ef = lead time

Fig. 2.1: Inventory Model

The ideal inventory model is shown in Fig. 2.1. The stock on hand consists of two components, the working stock and the safety stock. Working Stock varies from zero to the order quantity (O) and represents the stock, which is used to satisfy demand between deliveries. Safety Stock (S), also called reserve stock, buffer stock or fluctuation stock, exists to protect against stockouts which would otherwise occur when deliveries are delayed for any reason or the working stock is consumed at an unexpectedly high rate.

In the ideal model, drugs are issued in response to demand and the stock on hand steadily declines until the point at which an order must be placed. Following the lead time period, during which all the activities of the procurement cycle are performed, the quantity ordered (Q) is received and the inventory level is back to its starting maximum point (Q+S).

From Fig. 2.1, it is apparent that the average working stock is one-half of the order quantity.

Average working stock = ½Q.

To reduce the average inventory and, thereby, reduce the inventory holding costs, either the working stock, the safety stock, or both should be lowered.

When drugs are used at a constant rate, the line in Fig. 2.1 representing stock on hand declines with a constant slope. The working stock can be reduced only by placing smaller order (reduce the size of Q) more frequently.

3) **Reorder Level**

This denotes the stock level at which a fresh order has to be placed. This is equal to average consumption per day multiplied by lead time plus the buffer stock. We can avoid stockouts by working out the reorder level of all important material so that immediate action can be taken as soon as the stocks drop to reorder level. In fact, the author advocates simple practice of material management by calculating the reorder level of all stored items to ensure we do not overstock or understock the material. This practice can simplify the store management particularly when we do not want to indulge in complicated mathematical calculations.

4) **Economic Order Quantity (EOQ)**

This is the most economical quantity of the material to be purchased. As mentioned earlier, the ordering costs and the inventory carrying costs are antagonistic to each other, if we keep the ordering costs low (by placing fewer orders) the inventory carrying costs go up as we have to purchase huge quantities which locks up our capital and storage space. The reverse is also true, when we keep the carrying cost low (by ordering smaller quantities). The ordering costs will tend to rise as we have to place more frequent orders. To confront this situation, we have to strike a balance between these two costs. EOQ is a tool for the same.

The formula is $EOQ = \frac{2A \times Oc}{Pc \times Ic}$

A = annual demand of items in units
Oc = ordering cost
Pc = purchase cost of item per unit.
Ic = inventry carrying cost in percentage.

Example: If annual demand (A) of Inj. Ampicillin 1 Gm is 20,000 units, the cost of placing order (Oc) is Rs. 100, the purchase cost (Pc) is Rs. 20 per unit and the inventory carrying cost is 20% of the purchase cost, the calculation will be:

$$EOQ = \frac{2 \times 2000 \times 100}{20 \times 0.2} = 1000 \text{ units}$$

While the industrial sector can precisely calculate these costs the EOQ formula will be very handy for them to buy the most economical quantity. The hospitals may find it difficult to calculate these costs particularly the indirect or hidden costs.

2.6 LET US SUM UP

An inventory can be identified as those goods, which are procured, stored and used for the daily requirement of the organisation. They are sort of lubrication for the supply-production-distribution system that protects it from excessive friction. Inventories isolate one part of the system from the next to permit each to work independently, absorb the stock of forecast errors and permit the effective utilization of resources when demand fluctuations are experienced.

Thus inventory management is the process of deciding what and how much of various items are to be kept in stock at optimum overall costs to the health care system. It is the science and art of weighing the costs of carrying the stock against the losses that may accrue if the material is not available when needed. No one can predict with complete certainty what the demand will be or what the subsequent loss will amount to if the material is not available. Nor is it easy to estimate the costs of following various alternative-stocking policies. However, it must be mentioned here that all systems and organisations must be primarily designed to supply drugs, medicines and other supplies in time in order to provide meaningful and effective service.

When an organisation has material inventory, costs are inevitably incurred. Money that could otherwise be profitably employed elsewhere is tied up, physical storage costs are incurred and there may be losses due to spoilage or pilferage. All these costs added together comprise what is called the cost of possession. Purchase quantity is usually the biggest determinant of inventory investment, and consequently, of average carrying cost. As long as usage is reasonably regular, inventory tends to be increased by an average amount equal to one half the purchase quantity. There is usually an inverse relationship.

2.7 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) Objectives of inventory control:
   i) To maintain availability of materials whenever and wherever required.
   ii) To minimize the ineffective stock
   iii) To optimize the various costs associated with inventories.
2) Various costs involved in Inventory Management are:
   i) Purchase cost
   ii) Inventory carrying cost
   iii) Shortage cost
   iv) Ordering cost

If the purchase cost is lowered by buying in bulk the carrying cost will go up, and vice-versa. Also if the carrying cost is to be minimized the ordering cost will go up as frequent ordering will be required.

3) Various inventory carrying costs are:
   i) Cost of using or borrowing money
   ii) Cost of manpower
   iii) Cost of storage space
   iv) Cost of obsolescence
   v) Cost of deterioration
   vi) Cost of pilferage.

Check Your Progress 2

Various ways of classifying inventories:

i) ABC – Based on Annual consumption cost of items.
ii) VED – Based on criticality or shortage cost of items.
iii) HML – Based on rate of consumption.
iv) SDE – Based on the availability of the items in market.
v) FSN – Based on issues from stores.
vi) XYZ – Based on the value of Inventory Stored.
vii) GOLF – Based on source of supply.
viii) SOS – Based on seasonal requirements.

Check Your Progress 3

1) Functions of inventory control are:
   i) Stocking of adequate amount, number and range of stores at all service outlets.
   ii) Provide minimum supply service consistent with maximum efficiency and optimum investment.
   iii) Provide a cushion between the forecasted and actual demand for a material.
   iv) Gives optimal outlay of financial and human resources.
2) Factors determining inventory policies should be based on what to order, when to order and how much to order:
   i) Requirement
   ii) Lead tissue
   iii) Cost factors
   iv) Financial politics/liquidity
   v) Availability of credits
   vi) Obsolescence
   vii) Government policies
   viii) Storage factors
   ix) Patient service provider relations
   x) Marketing conditions.

Check Your Progress 4

1) In the ABC analysis the items in stock are classified in A, B and C categories based on the Annual Consumption cost of each item. Usually 'A' items are 10% of all items consuming 70% of total budget. 'B' items are 20% of all items consuming 20% of total budget. 'C' items are 70% of all items consuming 10% of total budget. Hence 'A' items to be under strict control of top management. Rest of the 'B' and 'C' categories can be dealt by middle and lower level management respectively.

2) In this analysis the items are classified into Vital (V), Essential (E) and Desirable (D) as per the criticality or shortage cost of the store items. 'V' Items are those, the absence of which cannot be tolerated even for single moment. 'E' items are those, where the non-availability for some time may be tolerated but not for long time. 'D' items are those, the absence even for longer duration will not seriously hamper the normal/general functioning of the hospital.

   VED classification of items will vary from Hospital to Hospital and it will purely depend on the objective of the Hospital.

3) Buffer stock or safety stock is the minimum quantity of supplies set apart as an insurance against variation in supply and demand. Hence it acts as cushion to deal with the unforeseen exigencies or emergencies.

4) This denotes the stock level at which a fresh order has to be placed. This is equal to average consumption per day multiplied by lead time plus the buffer stock. By this it will help the store manager to ensure that there will be no overstocking or understocking of materials.

UNIT 3 EQUIPMENT MANAGEMENT – PLANNING AND PROCUREMENT

Structure

3.0 OBJECTIVES

After going through this unit, you should be able to:

- describe briefly the present state of medical equipment in Indian Health Care Institutions;
- describe the various steps in procurement of hospital equipment;
- understand the concept of utilisation index; and
- describe the various factors affecting equipment utilisation.

3.1 INTRODUCTION

In this unit, you will learn about the essential steps for equipment selection. You will also learn about the various factors which affect equipment utilization. You are aware that hospitals have undergone a quantum change in concept and care provisioning from ancient days to the present era. The information explosion and technological advances have revolutionised the medical care. The sophistication in the medical field has led to the development of specialised care centres in an attempt to provide high quality care. Modern medical technology has contributed immensely in improving the quality of health care and state of health profile of nations. The advancement has been mainly due to:

- improved diagnostic facilities,
- sophisticated equipment, and
- spectacular progress in development in surgical procedures.

Besides surgical and technological advances development of safer anaesthetic techniques has lead to the development of disciplines like Cardiothoracic Surgery, Neurosurgery, Renal Transplant, Radioimaging and so on.

3.2 PRESENT SCENARIO

The resultant of the rapid advances in medical sciences and technology have been:

- The physicians are becoming more and more equipment oriented.
- The patients are much informed of the modern facilities available in our country and abroad. They start expecting and demanding the same.
- There is at present a flair for introduction of computer technology in the medical field.

The introduction of state of the art technology has resulted in metamorphic changes in diagnostic and therapeutic modalities in patient care activities. This has led to enhancement of quality of life and decreased morbidity and mortality rates. However, modern medical technology is not a panacea for all ills. The adverse effects include supplier induced demands, indiscriminate use, duplication and underutilization.

Studies on equipment management have indicated that any given time in most of the hospitals non-functional equipment may account for 40-50% of all equipment procured by the hospital.

Most of the states and other organisations in India have laid down rules and regulations for the procurement of equipment and other supplies in hospitals. The basic rationale behind all these rules, regulations and procedures is to maximise the value of the money invested in the purchase of equipment.

In practice the term purchasing describes the process of buying. It generally involves exchanging money for goods. The procurement should also focus on the cost benefit analysis, replacement and disposal of old existing equipment. Indigenous equipment, if available should be preferred to imported ones. Procurement is described as the total responsibility for buying. It involves choosing the items, specifications, identifying the best source of supply, establishing a delivery date and the acquisition of items at the most favourable cost.

3.3 STEPS FOR EQUIPMENT SELECTION

The following are the essential steps for equipment selection:

1) **Need assessment:** The basic purpose and reason for going in for a particular equipment should be enunciated beforehand. In the hospitals where there is requirement of new equipment, there is a need to do the survey before hand and justifying the need of a particular equipment to be provided. In many countries before a new facility is to come up a team comprising hospital administrators, hospital engineers, epidemologist, financial experts visit the particular hospital and assess the need and thereafter they issue a Certificate of Need (CON) before allowing new facilities to come up.

2) **Use coefficient:** This coefficient is applied to assess the utilisation of an equipment i.e. whether the equipment is optimally utilised or underutilised. Additional demands of the equipment may be assessed by use of the formula:

$$\text{Use Coefficient} = \frac{N}{M} \times 100$$

where, N = Average number of hours the equipment is used per day.

M = Maximum number of hours the equipment can be used per day.

If the use-coefficient is less than 50%, it is considered to be underutilised and hence a bad investment. However, life saving equipment cannot be subjected to this kind of assessment.

3) **Cost consciousness:** While procuring a new equipment the total cost of the equipment must be kept foremost in mind during the entire cycle of equipment planning and procurement. Cost containment procedures may be thought at every stage of the procurement procedures.

4) **Specifications and not the brand:** There should be insistence on exact specifications of the equipment. Tenders floated with the exact specifications will set about a healthy competition which works to advantage. Functional requirements should be known and based on these, technical specifications should be developed. Based on these one shall be able to negotiate sometimes an unimaginative price. The clinicians requirement of equipment may thus be obtained at a lesser cost.

5) **CIF destination:** Normally insurance and freight are covered up to nearest port with customer clearance facility. In case of procurement of very sophisticated, expensive and imported items moving the equipment to the institution with custom clearance may cost an additional 1-2% of the value of equipment. This should be confirmed at the time of negotiation. Most of the suppliers would be willing to absorb the additional cost and the burden of customs clearance.

6) **Installation on turn key basis:** It has been observed that costly equipment installed on turn key basis have better utilisation as total equipment planning considerations like civil, electrical, air-conditioning installation etc. are ensured by the firm. Thus the equipment when handed over to the hospital is normally fully functional. Prior to the commissioning of the facility, adequate number of personnel must be trained by the firm.

7) **Warranty with spares:** It is the age of electronics due to fierce competition in market, the manufacturers are yielding to higher and higher warranty period that too with spares. The cost of spares range from 3-5% of the value of equipment. What used to be a conventional warranty period of one year can now be bargained for 2-3 years without much additional cost.

8) **Continuous supply of consumables:** Some equipment may need expensive consumables to be imported. Every effort must be able to secure as many consumables as possible to last for a minimum period of one year. Sufficient guarantee has to be ensured for continuous supply of consumables thereafter for at least 10 years.

9) **Service contracts/After sale services:** It is important to ensure continuous and an uninterrupted functioning of the equipment. Services contract must be conceived and planned at the time of purchase. The supplier may dictate the terms and price if plan for service contract is done at the end of the warranty period. Accepted norms for the service charged is 1-2% of the cost of equipment for the first year after warranty with a 10-15% increase each year.

10) **Training of staff:** Training of staff to handle the equipment efficiently may range from training at site to training abroad depending upon the sophistication needs of the staff and institution. This should be ensured with the supplier to provide necessary training to the staff free of charge before placing the order. Timely and appropriately training the staff for handling and operating the equipment is a prerequisite for effective and optimum utilisation of an equipment.

11) **Preparation/Selection of site:** It is necessary to consult experts while planning for the site of the equipment. It calls for a team-work to plan for a proper site which does not require any modification later. The team consists of an architect, civil electrical and A.C. engineer, including the installation engineer. Their recommendations can be critically evaluated suitably by the administrator since the expert and engineers are known to be over ambitious in demanding space.

12) **Foreign exchange:** Life saving equipment are exempted from customs duty. Foreign currency value keeps on frequently fluctuating. If it is envisaged that the lead time of the equipment to be procured is more than 3 months, it may be wiser to indulge in forward booking where bank undertakes to take care of fluctuations for a specific period by charging a premium and understanding from the supplier to cover the expenses on extension of letter of credit and exchange fluctuations.

13) **Facility for back up power supply:** As most of the vital and essential equipment are functional on electricity or chargeable battery supply, facility for back up power supply should be ensured. Some arrangement has to be made in the form of stand by generators or if possible Uninterrupted Power Supply (UPS).

14) **Good economics:** There are several other factors to be taken into consideration like cost and availability of consumables, consumption of water, electricity, need for air conditioning, service contract facility and availability of spares at least for ten years. An equipment may be offered at a very low price but the consumables required may have to be imported later at a phenomenal cost. It may be wiser to purchase a more expensive equipment which can be operated with much cheaper consumables available locally.

15) **Supplier selection and purchase procedure:** It is essential that the specifications, other terms and conditions, supplier selection should be done after a careful analysis. A detailed and specific purchase order should be given. The equipment should be received by a responsible person. Board of officers constituted should certify that the equipment is as per specifications and functioning satisfactorily. Technical and users manual should accompany the equipment. The equipment should be adequately utilised and the performance monitored and evaluated.

Check Your Progress 1

1) Mark true or false:

i) Generally in most of the hospitals in India the medical equipment is in a satisfactory state. (True/False)

ii) Imported medical equipment is more reliable and easy to maintain than an indigenous one. (True/False)

iii) Purchasing encompasses the process of procurement. (True/False)

2) Enumerate the various essential steps for equipment selection in health care institutions.

3.4 HOSPITAL EQUIPMENT UTILISATION

It should be the earnest endeavour of the management and users to optimise the equipment utilisation to obtain maximum return for the capital invested. In an era of cost-intensive medicare, every equipment being installed in health care institutions need to be fully and properly utilised.

An optimum utilisation of equipment will result in:

- Optimal patient handling and rapid turnover.
- Minimum possible cost.
- Quality patient care and satisfication.

Utilisation essentially means the use of the equipment to its full potential.

3.4.1 Utilisation Index

Utilisation index is one of the important parameters to monitor the functional status of the equipment or it is the parameter to assess the productivity of service or an equipment.

3.4.2 Important Factors Affecting Utilisation of Equipment

The important factors are:

1) **Training of staff:** Timely and appropriate training of the staff handling and operating the equipment is a prerequisite for effective and optimum utilisation of an equipment.
2) **Equipment installed on turn-key basis:** It has been observed that costly equipment installed on turn key basis have better utilisation as total equipment planning considerations like civil, electrical, air-conditioning installation etc. are ensured by the firm. Thus the equipment when handed over to the hospital is normally fully functional. Prior to the commissioning of the facility, adequate number of personnel are to be trained in their premises.
3) **Preventive maintenance and after sales services:** Insisting on regular after sales services of the equipment and a proper system of preventive maintenance, downtime of costly and essential equipment can be considerably reduced thereby increasing utilisation. Normally the annual maintenance cost of an equipment varies from 1-4% of the capital cost of the equipment. By ensuring availability of repair, maintenance and necessary spares, equipment utilisation can be significantly increased.
4) **Facility for back up power supply:** As most of the vital and essential equipment are functional on electricity or chargeable battery supply, facility for back up power supply should be ensured. Some arrangement has to be made in the form of standby generator or if possible Uninterrupted Power Supply (UPS).
5) **Time scheduling of the hospital:** Hospital timing can be scheduled in such a way that there is optimum utilisation of the costly equipment. Usually in government hospitals the facilities work only 8 hours or one shift which amounts to 33% or practically 25% of utilisation. If these facilities can be made available for two shifts, high cost equipment can be utilised for 50-60%.
6) **Use coefficient:** This is applied to assess the utilisation of an equipment i.e. whether the equipment is optimally utilised or underutilised. Additional demands of the equipment may be assessed by the following formula:

$$\text{Use Coefficient} = \frac{N}{M} \times 100$$

where, N = Average number of hours the equipment is used per day.

M = Maximum number of hours the equipment can be used per day.

If the use-coefficient is less than 50%, it is considered to be underutilised and hence a bad investment. However, life saving equipment cannot be subjected to this kind of assessment.

7) **Awareness of the Facility:** There is a changing trend in health-care delivery system. Hence, it is propised that to ensure optimum utilisation a marketing strategy be evolved where services can be made popular in the community to gain maximum benefit of the capital of the capital investment.

8) **Utilisation of the Special Facility or Skill:** Any facility, the X-ray, ultrasonography, CT scanning if underutilised due to paucity of workload, should be shared with other hospitals. Networking of resources would ensure optimum utilisation of the costly equipment.

3.5 PROCUREMENT OF IMPORTED EQUIPMENT

In this section you will learn about the procedures involved in the procurement of imported equipment. Given below is a sample of tender form for supply of imported equipment. This will help you in understanding the process of supply of equipment of foreign origin.

Sample of Tender Form

From: ..... To: .....

Letter No: ..... Date: .....

Dear Sir/Madam,

1) This hospital is interested in the supply, installation and commissioning of import of the following:

   a)

   b)

2) You are invited to send us a proforma invoice from your principals. The proforma invoice should be in a quadruplicate and in the name of the ..... The documents may please be posted at the address given above. The latest hours and date of receipt of the offer is up to ..... hours on .....

3) **Delivery of Tender**

   Tenderers should submit their tenders in three parts (i) Price bid, (ii) Technical bid and (iii) Bid guarantee, each part in separate sealed covers as under:

   Price bid (in triplicate) should be placed in a separate sealed cover duly superscribed price bid for ..... Similarly technical bid (in triplicate) should be placed in a separate scaled cover duly superscribed technical bid for .... The bid guarantee (Earnest money) should also be placed in a separate scaled cover duly superscribed Bid Guarantee for .....

   All these three envelopes should be placed in a big envelope which will form the main cover. This main cover must be superscribed Tender for ..... due on ..... at .....

   All the other three envelopes should also bear the address of this office as given above. The price bid should be kept valid for acceptance for a period of 180 days after

opening of the tender. The purchaser will not be responsible for any postal delay or any other cause that may lead to delay in the receipt of the documents in this office beyond the stipulated date and time stated in the tender documents. The detailed instructions with respect to bids are given below.

The technical bid shall be opened at hours on ..... It should be submitted in quadruplicate indicating precise details, any limitations or extension of the requirement should be clearly spelt out. Quotations which do not give precise technical information are likely to be ignored. The operating and service manual of the equipment should accompany the technical bid.

4) Only manufacturers or their sole authorized distributors/sole agents are entitled to submit the proforma invoice. The proforma invoice must be from the manufacturers abroad. All offers other than those from the manufacturers should be supported by an authority letter in original from the manufacturers authorizing the firm to tender on their behalf. Certificate to the effect that you are the manufacturers of the equipment/ authorised sole distributors or sole agents for manufacturer on whose behalf you are quoting, must be included in the documents. The said certificate should be duly attested and stamped by the authorized signatory of the firm. The firm should enclose a certificate that they are enrolled with the Directorate General of Supplies and Disposals, Parliament Street, New Delhi to act as Indian Agent.

5) In addition to quoting for the equipment as per para 1 above, tenderer must quote the charges and terms and conditions of service contract for a period of 5 years for maintaining the equipment at this hospital after the expiry of the period or warranty. During the service contract period the firm shall provide preventive maintenance and in addition attend to all emergent and breakdown calls. The service contract charges should be quoted for labour cost only and should not include the cost of any replacement parts/components that may be needing replacement. Thus the charges quoted will be of service only which would include the cost of the engineers time and travel etc. During the contract period replacement of parts/components that may be needing replacement shall be made available by the firm at the hospital's own expense and all import formalities, payment of customs duty etc. shall also be compiled with/ borne by the hospital. The charges shall be paid to after the satisfactory service.

6) The up-time guarantee of 328 days in a block of 365 days of the service contract period should be ensured. The principals or their agents are required to submit a certificate that they have satisfactory service arrangements and fully trained service staff available to support the up-time guarantees. Tenders not containing service contract charges shall not be considered and shall be rejected.

7) Tenderers must attach, along with the Technical Bid a photocopy of the constitution of the firm indicating partnership deed, if any the time of the proprietor/partners.

Foreign firms quoting direct against their tender enquiry should attach, along with the technical bid, a certificate giving the name and address of their Indian Agents or their representative they have in position for servicing the equipment in India.

In case the offer is from other than manufacturers, then a certificate that quantum of Indian Agency Commission mentioned by the firm in the proforma invoice in the same as is being charged from other departments/Institutions for similar items, must accompany the Technical Bid.

A list detailing all places in India where the same equipment or similar equipment has been installed by the Company should be attached. Documentary evidence wherever possible in support of this list and also certificates of its satisfactory working from those mentioned in the list, should also be enclosed.

In case the offer is from other than manufacturers, then an Authority letter from the manufacturers authorizing the firm to tender on their behalf must accompany the technical bid.

Tenderers must furnish along with the technical bid the latest current valid Income Tax Clearance Certificate and Sales Tax Certificate or attested photocopies there of.

Tenderers must furnish along with their technical Bid a certificate that the Indian Agency commission, if any payable has been included in FOB value and that no Indian Agency commission other than that stipulated in the proforma invoice is payable by the foreign manufacturers to the Indian Agent.

8) **Bid Guarantee and Security**

a) The tender must be accompanied with Earnest money for Rs .....

in a lump sum amount in the form of deposit at Call Receipt/Terms deposit valid for one year from any scheduled bank in the name of the ..... Earnest money in any other form will not be accepted.

b) Bids not accompanied by Earnest money as stated above or less than the amount stipulated above shall be summarily rejected.

c) Earnest money/security deposit/any other sums of the tenderers with the hospital in connection with any other tender/case will not be considered against this tender.

d) The successful tenderer shall be required to furnish a contract performance guarantee bond in the shape of Bank Guarantee for an amount equivalent to 5% of the FOB value of the equipment towards the execution of the agreement and the warranty. The Bank guarantee should be valid till the expiry of the warranty period of 24 months. The Bank guarantee for 5% of the FOB value will be submitted within a period of 15 days after the placement of the supply order failing which the order will be liable to be cancelled and the Earnest money forfeited.

e) The hospital would return the Earnest money mentioned in para (a) above to the successful tendering firm on the submission of the Bank guarantee above.

f) The successful tenderer will submit bank guarantee equivalent to 2% of the FOB value to recover the service contract period after the expiry of warranty period of 24 months. Bank Guarantee mentioned in para 8 (d) above will be returned on the receipt of bank guarantee indicated in this clause.

g) The hospital does not pledge itself to accept the lower to any other tender, and reserves to itself the right of acceptance of the whole or the part of the tender or portion of the quantity offered and the tenderers shall be required to supply the same at the rate quoted. The hospital reserves to itself the right to accept or reject any or all the tenders without assigning any reasons thereof.

9) **Customs Clearance**

i) The equipment requiring import from abroad will be imported under the OGL scheme, for which tenderer will ensure before shipment takes place, that the equipment, in question can be imported under the said scheme.

ii) It will be the responsibility of the purchaser to get the customs clearance of the equipment done (however the tenderers will assist in the clearance of consignment as and when required). The tenderer will pursue any claims with the custom authorities/insurance company/cargo operators and transporters as may arise at any stage.

iii) The N.M.I.C. (Not manufactured in India) and the duty exemption certificate and any other documents required for custom clearance will be provided by the hospital.

10) **Insurance**

The manufacturers will ensure that the equipment is properly insured for the full CIF value to cover the transit up to site of installation. If the installation is delayed beyond the agreed date of satisfactory installation commissioning and handing over of the equipment, then in that event any transit and storage damages which come to light after such delays, shall be at the risk and cost of the tenderers. The Tenderer/Indian Agent shall provide to the hospital after the inspection, a detailed list of any loss or damage to the stores that may have occurred so as to enable the purchaser to file appropriate claims with the Insurance Company. However, it shall be the responsibility of the hospital to prepare, lodge and pursue any claims that may arise with the Insurance Company. The manufacturers shall provide all assistance in pursuing any such insurance claims expeditiously. The manufacturer shall make free replacement, if required, in lieu of damaged/lost items etc. regardless of the fact whether the claim is settled by the underwriters or not. The manufacturer's liability shall be restricted to making free replacement/rectification and any local expenses such as custom duty/ clearance, etc. connected with such replacement shall be borne by the hospital.

11) It should be noted that, if, in consideration or offer of earlier delivery, the contract is placed with higher tenderer on preference to the lowest acceptable offer, the tenderer will be liable to pay to the hospital the difference between the contract rate and that of the lowest acceptable tenders on the basis of the final price for destination, including all elements of freight, sales tax, local taxes, duties and other incidentals, in case of failure to complete supplies in terms of such contract within the date of delivery

specified and incorporated in the contract. This is in addition to cover all other losses and damages resulting from delayed supplies and cancellation and risk purchase in case of failure to supply the stores and without prejudice to other rights of the hospital to recover all other losses and damages resulting from delayed supplies and of cancellation and risk purchase in case of failure to supply the stores guarantee/ warranty. The tenderers will be required to furnish guarantee/warranty from the manufacturers as under:

The guarantee/warranty against defects of manufacturer/workmanship and poor quality components for the entire equipment shall be for a period of 24 months starting from the date of satisfactory installation. Commissioning and handing over the equipment in working order..... During the guarantee/warranty period, the replacement of any part(s) of the ..... equipment of rectification of defects of works will be free of cost. In case of any replacement during guarantee period, all formalities such as connected with such import of replacement shall be completed with by the purchaser. Further the defective parts/equipment shall be returned by the purchaser to the supplier, prior to making replacement. During the guarantee/warranty period the up time as defined earlier will be maintained. If the down time exceeds seven consecutive days at the time, the guarantee/warranty period will be extended beyond 24 months to a duration equal to the total of such periods of down time during the period of warranty.

The tenderer should submit a written guarantee from the manufacturers stating that the equipment being offered is the latest model as per specifications and that spares for the equipment will be available for a period of atleast 10 years after the warranty period. The manufacturer should also guarantee that it will keep the hospital informed of any update of the equipment over a period of next 5 years and undertake to provide the same to the hospital at no extra cost.

Guarantee that they will supply regularly any items of spare parts requisitioned by the purchaser for satisfactory operation of the equipment till the life span of the equipment if and when required, on agreed basis for an agreed price. The agreed basis could be an agreed discount on the published catalogue price or an agreed percentage of profit on the landed cost.

Warranty to the effect that before going out of production of spare parts, the manufacturers and/or tenderers will give adequate advance notice to the purchaser of the equipment so that the latter may undertake to procure the balance of the life time requirements of spare parts.

The warranty to the effect that the manufacturers will make available to the hospital the blue-prints and drawings of the spare parts if and when required in connection with the equipment.

The tenderer hereby furnish the following warranty in case the contract is placed on him.

The tenderer hereby declares that the goods/stores/articles supplied to the buyer under this contract shall of the best quality and workmanship and shall be strictly in accordance with the specifications and particulars contained/mentioned in the clause here of and the tenderer hereby guarantee that the said goods/stores/articles conform to the description and quality aforesaid. The purchaser will be entitled to reject the said goods/stores/articles or such portion there of as may be discovered not to conform to the said description and quality. On such rejection the goods/stores/articles will be at the seller's risks and all the provisions have here in contained relating to rejection of goods etc. shall apply. The contractor/seller shall, if called upon to do so, replace with in period of fourteen days or such further period as may be extended from time to time by the purchaser at his discretion on an application made thereof by the tenderer, the goods/stores/articles or such portion thereof as rejected by the purchaser and in such an event the above mentioned warranty period shall apply to the goods/stores/articles replaced from the date of the replacement thereof, otherwise the tenderer shall pay to the purchaser such damage as may arise by reason of breach of the conditions herein contained. Nothing herein contained shall prejudice any other right of the purchaser in that behalf.

Note: If there are any parts of consumable nature which are not covered under the above said guarantee/warranty clause, then details of same with nomenclature etc. must be furnished.

12) **Mode of Despatch, Delivery and Commissioning of Equipment**

The equipment with all its accessories should be dispatched by duly insured, freight and insurance charges pre-paid. The tenderer is required to undertake to deliver and install the commission the equipment within a period of days from the date of opening of letter of credit.

13) **Damage of Delay in Supplies/Installation (Liquidated Damage)**

In the event of delays in supply installation and commissioning of the equipment to the satisfaction of the purchaser beyond the stipulated date, the purchaser shall have the right to recover damages at the rate of 2% of the FOB value of the equipment (including components, spares, accessories and optional items) per month or part thereof, by which the supplies or their satisfactory installation and commissioning is delayed subject to a maximum of 10% damages on this account.

The acceptance of the equipment will be based on demonstration of the satisfactory working of all models of the equipment as tested by the Head of Department. The materials, etc. required for demonstration of satisfactory functioning of the equipment shall be arranged by the suppliers.

14) **Contract**

The successful bidder will be required to enter into an Agreement with the hospital on a non-judicial stamped paper for the supply and satisfactory installation of the equipment as per specfications and terms and conditions listed in this tender document and agreed upon.

15) After satisfactory installation the firm will provide requisite training to the staff of the hospital at site at no extra cost.

16) **Uptime Guarantee**

At the end of the guarantee period of the 24 months the hospital shall enter into a service contract with the firm. The firm will be required to guarantee that during warranty period as well as during the service contract period, the equipment will be maintained in good working condition for a period of 328 days out of a period of 365 days (i.e. 90% uptime), 8 hours non functioning of the equipment may be considered as one day down time. Essential period to shut down the installation entirely or partially shall also be included in the down time while calculating the 90% guaranteed uptime. No deduction or advantage of any kind on account of Sundays, half days on Saturdays, public/Govt. holidays observed by the hospital shall be allowed from the total down time permissible as defined above except that such of Sundays, half days on Saturdays, public/Govt. holidays on which the hospital is not able to provide facilities for service/repairs of the equipment shall not be counted in the downtime. The equipment will thus required to be maintained in satisfactory working conditions for a minimum of 328 days in each period of 365 days which defines the 90% uptime required to be maintained in each such period of 365 days. This guaranteed uptime shall be calculated for each block of 365 days. The firm will be required to pay a penalty of Rs. ..... per day in case the number of days of down time in each period of 365 days in more than the down time, permissible which is to be calculated as defined above and the delay for not bringing the equipment in functioning order is in any way directly, even partially attributable to the firm.

The Penalty will apply only for the number of days the permissible down time as defined above is exceeded. For purpose of calculation of down time, any down time period less than 8 hours shall be excluded. During the service contract period the time taken by the hospital in providing to the firm the spare parts shall not count towards the down time. During the guarantee period the time taken by the hospital to provide the customs duty exemption certificate, Not Manufactured in India certificate, import licence etc. for enabling the tenderers to import any spare part, shall not count towards the downtime.

17) **Opening of Tender**

The bids shall be opened on .....Technical bid ..... hours non price bid ..... hours on ..... You are at liberty to be present, in person or through your authorized representative at the opening of the tender at the time and date specified in the tender notice. In the event of the day of receipt and opening of the tender being a holiday for the hospital then due date of receipt/opening of the tender will be the following working day at the same hour.

18) **Period for which the Offer will remain Open**

The tendering firms should keep their offers valid for acceptance for a period of 180 days from the date of the bids.

19) **Payment**

The hospital will pay 100% CIF value excluding Indian Agency Commission of the goods to the tenderer through an irrevocable Letter of Credit (LOC) against negotiable shipping documents.

Country of origin will be one and not more. Expenditure on release of LOC by the foreign firm will be borne by them. No amendment in LOC will be allowed which is not in the Quotation/Tenders.

The hospital shall make all reasonable and due efforts to pay the Indian Agency Commission out of the FOB value to the Indian Agents at the earliest possible within 30 days after satisfactory installation/commissioning and handing over of the system in good working condition and meeting any other requirements for payment of the Agency Commission. The rate of exchange applicable for converting agency commission into equivalent Indian rupees shall be the T.T. selling rate prevalent on the date of releasing the documents by the Bankers. The Indian Agency Commission out of the FOB value will be paid in Indian Currency (Rupees) to the Indian Agents.

20) **Packing and Marking**

Best trade packing suitable for safe Rail/Road/Air transit shall be used subject to packing and marking being acceptable to the Inspecting Authority.

a) The supplier shall provide such packing of the goods as is required to prevent their damage or deterioration during transit to their final destination as indicated in the contract. The packing shall be sufficient to withstand without limitation, rough handling during transit and exposure to extreme temperature, salt and precipitation during transit and open storage. Packing case size and weights shall take into consideration, where appropriate, the remoteness of the goods final destination and absence of heavy handling facilities at all points in transit.

b) The packing marking shall show the description of quantity of contents, the name of the consignee and address, the gross weight, a distinctive number of mark sufficient for purpose of identification. Each package shall contain:

   i) A packing note quoting the name of the purchaser

   ii) The number and date of order

   iii) Nomenclature of the goods

   iv) Schedule of parts for each complete equipment giving part number with reference to assembly.

   Not withstanding anything stated in this clause, the supplier shall be entirely responsible for loss, damage, deterioration, depreciation of the goods due to faulty packing.

21) **Preparation and Delivery of Tender**

Tender documents must be signed by the tenderers in full along with their stamp.

If any time, any question, dispute or difference whatever shall arise between the two parties (hospital on the one hand and vendor on the other hand) in relation to the purchase, either of the parties may give to the other notice in writing of the existence of such a question, dispute or difference and the same shall be referred to two arbitrators, one to be nominated by the Institute and the other to be nominated by the firm. Such a notice of the existence of any of any question, dispute or difference in connection with this purchase shall be served by either party within 30 days of the beginning of such dispute failing which all rights and claims shall be deemed to have been forfeited and absolutely barred.

Before proceeding with the reference the arbitrators shall appoint/nominate an Umpire. In the event of the arbitrators not agreeing in their award the Umpire appointed by them shall enter upon the reference and his award shall be binding on the parties. The venue of the arbitrator shall be at .....

The provision of the Indian Arbitration and Act Reconciliation Act 1996 and of rules framed there under and any statutory modification thereof shall be deemed to apply and be incorporated for the supply, installation and commissioning etc.

Upon every or any such reference, the cost of any incidents to the reference and award(s) respectively shall be at the discretion of the arbitrators or in the event of their not agreeing, of the Umpire appointed by them who may determine the amount thereof or direct the same to be fixed as between solicitors and client or as between parties and shall direct by whom and in what manner the same shall be borne and paid, venue to the Arbitrator will be .....

Jurisdiction

The courts at ..... alone will have the jurisdiction to try any matter, dispute on reference between the parties arising out of the contract. It is specifically agreed that no court outside and other than Court shall have jurisdiction in the matter.

Force Majeure

Any failure of omission or commission to carry out the provision of the contract by the supplier shall not give rise to any claim by any party, one against the other, if such failure of omission or commission arise from an act of God, which shall include all acts of natural calamities such as fire, flood, earthquake, hurricane or any pestilence or from civil strikes, compliance with any statue and/or regulation of the Government, lockouts and strikes, riots, embargos or from any political or other reasons beyond the supplier's control including war (whether declared or not) civil war or state or insurrection, provided that notice or the occurrence of any event by either party to the other shall be given within two weeks from the date of occurrence of such an event which could be attributed to Force Majeure conditions.

The hospital reserves the right to accept or reject in whole or in part any or all the quotations received without assigning any reasons therefor.

Termination for Insolvency

The purchaser may at any time terminate the contract by giving written notice to the supplier, without compensation to the suppliers, if the supplier becomes bankrupt or otherwise insolvent (which events shall of themselves be a breach of the contract on the part of the supplier), provided such termination will not prejudice or affect any right of action or remedy which has accrued or will accrue thereafter to the purchaser.

Termination for Convenience

The purchaser, may by written notice sent to the supplier terminate the contract, in whole or in part, at any time for its convenience. The notice of termination shall specify that termination is for the Purchaser's convenience, the extent to which performance of work under the contract is terminated becomes effective.

The good that are complete and ready for shipment within 30 days after the supplier's receipts of notice of termination shall be purchased by the purchaser at the contract terms and prices. For remaining goods the purchaser may elect to

a) have any portion completed and delivered at the contract terms and prices; and/or

b) cancel the remainder.

Government Language

The contract shall be written in the language of the Bid (English Language) as specified by the purchaser. All correspondence and other documents pertaining to the contract shall be in English.

Now you procure a tender form for purchase of foreign equipment from a hospital and compare it with the sample tender form. Discuss your findings with the academic counsellor at your programme study centre.

3.6 LET US SUM UP

In this unit you have learnt that the introduction of state of the art technology has resulted in metamorphic changes in diagnostic and therapeutic modalities in patient care activities. This has led to enhancement of quality of life and decreased morbidity and mortality rates. However, modern medical technology is not a panacea for all ills. The adverse effect include supplier induced demands, indiscriminate use, duplication and underutilisation.

You have also learnt about the strategies for hospital equipment which include scientific need assessment, appropriate procurement, maintenance, repairs, optimum utilisation and

timely replacement. Equipment availability, functionality, effectivity, efficiency, utility assessment are the cornerstones in which the stores administrator plays a pivotal role in provision of satisfaction to staff, cost effectiveness to the hospital management and health care to the patients. Towards the end of the unit you have learnt about various issues involved in procurement of imported hospital equipment. Further you have learnt that Efficient equipment utilisation should be ensured to optimise health care facilities. A substantial number of equipment in Indian Health Care institutions is of foreign origin. It is imperative that appropriate steps are taken in the planning, procurement, installation, usage stages of these equipment to maximise utilisation and optimise health care facilities.

   f) Use coefficient
   g) Awareness of the facility
   h) Utilisation of the special facility

UNIT 4 EQUIPMENT MANAGEMENT – MAINTENANCE, REPAIR AND DISPOSAL

Structure

4.0 OBJECTIVES

After studying this unit, you should be able to:

- discuss the existing situation of hospital equipment;
- describe the essential features of timely maintenance and repair procedures; and
- discuss condemnation (discard policy) and disposal of equipment.

4.1 INTRODUCTION

Hospital equipment are based on sophisticated and high cost technology involving huge funds. An average hospital administrator/clinician is least aware about the complexities and technicalities involved in the right selection, procurement, specifications, installation, utilisation, maintenance and repair of these equipment. The situation is even worse when it comes to condemnation and disposal of hospital equipment. As a result of the same, the hospitals end up procuring equipment which may not be the best. Besides, we also end up paying more. The aggressive marketing by the equipment suppliers and agents may lead to various malpractices.

Maintenance and repair of these sophisticated equipment becomes the biggest casualty. Most of the hospitals are ill equipped for any organised and systematic maintenance and repair facility. In fact, even the basic facilities for maintenance and repair of hospital equipment are non-existent. This not only leads to long down time but also gross under utilisation and inefficiency, thus affecting the patient care adversely. Some surveys and studies have indicated that non-funcional equipment is a major contributory factor for wasteful expenditure in hospitals.

Optimum utilisation of equipment requires that the equipment remain in good working conditions for most of their life. Timely maintenance and repair of the hospital equipment, therefore, assumes vital importance. This unit will offer some guidelines on this complex problem and also on the condemnation and disposal of the equipment.

4.2 DEFINITION

Management, per se, is defined as the purposeful and effective utilisation of resources for accomplishing a pre-determined objective. Extending the same to equipment management, it would mean that we not only ensure greater utilisation of the hospital equipment, but also maximise their uptime and ensure the reliability, validity, efficiency and safety in their day to day functioning.

4.3 EXISTING SITUATION

The existing situation of the hospital equipment particularly their maintenance and repair is rather gloomy. Hospitals seldom have 50-60 per cent equipment in usable conditions. According to a survey by the Department of Electronics (DOE), Government of India, hightech medical equipment worth Rs. 50 crore are lying idle in government hospitals in Delhi and nine other States due to lack of spares, and non-availability of funds.

The survey was done in 132 government hospitals in nine states—Delhi, Madhya Pradesh, Orissa, Bihar, Punjab, Uttar Pradesh, Maharashtra, Assam, Haryana, Tamil Nadu. It disclosed that electro-medical equipment worth 48.61 crore out of the total cost of 180.58 crore were not in working conditions. As the survey did not cover all hospitals, except in Punjab, it extrapolated the result to conclude that equipment worth at least Rs. 50 crore may not be in working condition in these states. While presenting the findings of the survey, the then Secretary, Electronics identified some of the reasons for the non-working conditions as a) lack of maintenance policy by the hospitals and lack of provision of budget on this account, b) the non-availability of technical documents for installation, maintenance and safety since these equipment were either received as donations from various developed nations or purchased without having adequate purchase policies. The survey also found that lack of availability of spare parts, particularly for imported equipment, was also creating problems. In addition, the support for maintenance of such equipment was also grossly inadequate. "As imported equipment were also being handled through commission agents and local manufacturers had limited capabilities of providing after-sale services beyond the warranty period particularly in remote locations", the report said.

Table 4.1: Nation-wide Survey of Status of Medical Equipment

State	No. of hospitals visited/survey carried out	Cost of equipment surveyed (Rs. in crores)	Cost of equipment not working (Rs. in crores)
Madhya Pradesh	240	28.00	10.00
Orissa	4	10.50	4.60
Bihar	2	25.00	7.00
Punjab	NA	50.00	10.00
Uttar Pradesh	19	38.00	9.60
Maharashtra	24	3.20	1.14
Assam	39	10.00	2.00
Haryana	15	5.00	2.00
Tamil Nadu	5	10.88	2.27
Delhi	3	24.67	2.00
Manipur	17	0.20	0.04
	Total	**205.45**	**50.65**

The most common factors contributing to this wastage are:

Purhase of sophisticated equipment which is under-utilised or never used due to lack of technical expertise to maintain and use it.	Estimated wastage 20-24 per cent
Reduced lifetime of equipment due to mishandling and lack of maintenance and repair.	Estimated to affect 50-80 per cent of equipment value.
Additional purchases of accessories, extra spares and modification to facilities initially unforeseen due to lack of expertise in choosing appropriate equipment.	Estimated to affect 10-30 per cent of equipment value.

Lack of standardization, increased cost of spare parts or additional purchases and extra workload on limited competent staff.	Estimated to affect cost by extra 30-50 per cent
Excessive down time of equipment due to lack of preventive maintenance inexperience in repairs and lack of spare parts.	Estimated to affect 20-30 per cent of equipment
Shortage of foreign exchange compounds the problem of unfavourable purchasing contracts.	Estimated to add 10-30 per cent of equipment and spares

4.4 MAINTENANCE AND REPAIR FACILITIES

Once a hospital has been planned and provided with required equipment, there comes the need to manage/maintain them scientifically so that the quality service is provided to patients on a continued basis.

There is a large variety and diversity of equipment in a hospital. The nature and type of equipment vary in different hi-tech/mid-tech hospitals depending upon the competence, size, type of hospital. To illustrate, the range varies from a simple B.P. apparatus to highly sophisticated diagnostic and therapeutic gadgets, laboratory equipment, imaging equipment, anaethesia, O.T. equipment etc. This is only to name a few, hospital equipment also include those used in various other services viz., CSSD, mechanised laundry, kitchen, stores, and housekeeping.

In order to provide and establish efficient equipment maintenance service in hospitals, it is important that a written plan be developed, right from procurement and up to disposal of equipment. More so, for the reasons that the equipment are based on high cost and sophisticated technology.

4.4.1 Need for Repair and Maintenance Centre

In order to mitigate the long standing problems of hospital equipment maintenance (preventive and breakdown) which results in non-utilisation or under-utilisation of vast national resources thereby adversely affecting quality of health care delivery. Department of Electronics, Government of India has started a national programme through decentralised repair and maintenance centres in 12 States of the country. These centres are joint venture of DEO with State Electronics Corporations. At present, there are 13 such Electro Medical Maintenance (EMM) Centres in the country.

Objectives

The objectives of setting up of these centres are:

- to render repair and maintenance facility to hospitals, medical institutions and dispensaries in the State;
- to provide consultancy service to hospitals and medical institutions on electro-medical equipment in the area of pre-installation and operation of equipment; and
- to conduct training course for medical and paramedical personnel.

It was proposed to establish regional workshops on equipment maintenance in 6th Five Year Plan. First regional workshop was established at Medical College, Cuttack immediately after the 6th Five Year Plan.

4.4.2 Outline of the Plan of Biomedical Engineering Operations for Maintenance

There are enormous variations between hospitals according to different climate, location, the States size, the form of care provided and the type of patients seeking care. Still there are number of parameters common to almost every institution. In order to provide efficient maintenance services, it is important to develop a routine plan and guidelines. This plan should focus the attention on the common elements in the organisation, related to procurement and maintenance of the medical equipment in order to optimise and get the most out of the limited amount of money and other scarce resources. In planning of the biomedical engineering equipment for use in health institutions the elements involved are discussed below:

a) **Requirement of equipment:** At the every outset a realistic estimation of the requirement of equipment for different medical institutions would be the most important step for all future activities related to equipment. This exercise has not only to identify the bio-medical equipment, but also assess the quantity in which they are required based on estimated patient load needing the equipment. Give the specification of the same and also the sources of procurement of these equipment. Secondly, the bed strength of the hospital and type and range of services provided in the hospital would be other guiding factors for assessing requirements.

b) **Workload in terms of patients:** The need of these equipment would be directly related to the workload i.e. inpatients, outpatients, those attending the emergency services and intensive care units. The workload of patients would also help in assessing the requirement of the equipment in the other diagnostic, therapeutic, supportive and ancillary services.

c) **Budget planning:** The hospital and health care equipment are based on high-tech and are expensive. The meagre resources should take into account not only the purchase of equipment but its maintenance as well. Often ad-hoc grants/donor agency grants are used for the purpose without taking into account the maintenance which causes problem later on. Every hospital should have a part of budget allocated for maintenance of equipment.

d) **Preventive maintenance:** The preventive maintenance is an important aspect of equipment management. It is essential for efficient and effective functioning of equipment as well for increasing the life of equipment. As regards the preventive maintenance is concerned, care should be taken that new equipment are under warranty for a sufficient period to test its performance. Adequate steps should be taken for preventive maintenance of equipment while outlining the plan for equipment operations for maintenance.

4.4.3 Maintenance and Repairs

Maintenance as well as repairs are the two terms which are closely related to each other and also used combinedly. Broadly classifying, the equipment maintenance and repairs would include the following:

1) Preventive Maintenance

2) Master maintenance plan

3) Repair of equipment

a) As regarding the preventive maintenance of all expensive and sophisticated equipment is concerned, care should be taken that the new equipment/machines are under warranty for a sufficient period to test its performance. The essential spares should be obtained along with the equipment as a part of the configuration and the integral part of the purchase contract, to last for sufficiently long period say 5-10 years. The equipment should also be under service contract after 5 years also. Some penalty clause may be included in the purchase contract to this effect. For electronic equipment necessary safeguards should be carefully observed which may include:

   - Voltage stabilizers, built in or othewise
   - In high priority areas like operation theatre, ICU, ICCU, diagnostic services etc. voltage stabilization should be done areawise preferably through an uninterrupted power supply (UPS) system.
   - Separate line should be laid where voltage fluctuation is considerable

- Automatic switchover for emergency should be provided with a generator.

The requirements of electricity, water, space and atmospheric conditions should also be taken into account. For example, for certain life saving equipment, a three-phase supply of electricity should be provided. Such equipment should also be protected from the vagaries of weather in order to minimize the breakdown and also enhance the life of equipment.

b) As regard the routine equipment/instruments such as sphygmomanometer, suction apparatus, centrifuges, incubator, hot air ovens, ECG machine, etc. the maintenance cell (workshop) should have the required facilities in terms of skilled and trained manpower, adequate spares and infrastructural facilities.

c) The preventive maintenance will give rise to the following advantages:
   - Reduction in down-time of the equipment
   - Safety of equipment
   - Effective and economic functioning
   - Increased life of the equipment

The advantages of preventive maintenance can best be illustrated by following two examples.

Illustration I

The illustration is presented from the experience of a medium size trust hospital in Gujarat. Recently, because of non-functioning of simple equipment in the pathology department some very important investigation could not be carried out in time. Following a number of surgical operations a few specimens/excised tissues were sent to laboratory for histopathological reports. The histopathological test could not be carried out for the reasons that the microtome, an equipment which cuts out thin slides of excised tissue matter for microscopial examination, was not in a working order. It was found to be rusted and its blades could not be opened due to the rusting. This happened because this microtome was not washed, cleaned and oiled after its last use. This resulted in delay in reporting and more costs for getting reports from outside.

Illustration II

In another case the ultrasonography used in various departments for getting the image of different body organs could not be used for want of simple maintenance. The transducer (the rounded portion which is placed on the body) of this sonography equipment is always applied on the vairous parts of the body with the help of lubricating jelly. After a couple of months use this equipment stopped working. The reason was that the jelly which was repeatedly applied on the transducer before each use, formed a thick coating all around its surface which transmits the ultrasounds into the human body for getting an image (resolution) of that particular organ for helping in diagnosing the problem. This thick coating interfered with this transmission and gave a very poor resolution. All this could have been prevented if after each use the jelly was cleaned off the transducer with the help of simple normal saline solution and dried with muslin cloth.

Master Maintenance Plan

The master maintenance plan should be drawn in consideration of the load of the user departments including the following aspects of equipment maintenance and repairs:

- Recruitment of skilled manpower
- Arranging regular training programmes on maintenance and repairs of equipment of the technicians and other concerned personnel
- Establishing a bank of spare parts and crucial components
- Establishing detailed records of the purchase, procurement and maintenance of equipment
- Periodic checks and repairs
- Monitoring of the annual maintenance contract for expensive and sophisticated equipment
- Developing a 'maintenance cell' for maintenance and repair
- Establishing a nucleus of communication between this cell and the supplier of equipment
- Follow up of the maintenance and repair services.

Repair of Equipment

It is necessary to have basic in-house facilities for the routine repairs of the common equipment. It has been generally seen that many a times the hospital equipment are not working for want of simple repairs, such as faulty switches and plugs, loose wiring and sparking, fuse problems, lack of spare parts, lack of training in handling the sophisticated equipment and many other factors.

The in-house repair facility should be organized keeping the following in mind:

- Head of maintenance cell (workshop) should be completely accountable and responsible for the task under his control.
- The availability of skilled manpower for the repairs.
- Provision for a bank of spare parts and crucial components.
- All technicians and other workers handling important equipment should be provided with a separate tool kit consisting of all essential items required for repairs and maintenance.

The repair procedures must underline the following:

a) Repairing and servicing of sophisticated equipment only under the guidance of a skilled person.

b) This cell should also evolve and develop the procedures for requisitioning repair services as and when a particular equipment breaks-down or stops working.

c) If in-house facilities cannot repair a particular equipment, then the procedure for its repair from outside agencies should also be developed.

d) The downtime of each equipment should be specified and adhered to by the maintenance cell.

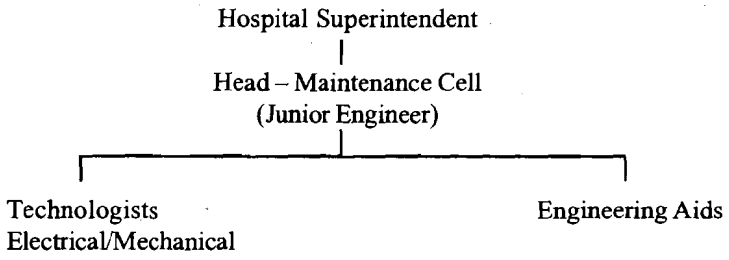
e) The technical personnel involved should be trained either by the established institutions or by the company supplying those equipment.

Staff and Organisational Structure

The staff and organisational structure for equipment management would vary depending on the nature, type size of a hospital. However, for a large district hospital following staff may be recommended:

1) A Junior Engineer (Electrical/Mechanical)
2) Two Technologists (Electrical/Mechanical)
3) Engineering Aids

The organisational structure is given below:



In large hospital the staff working in the maintenance cell would be the integral part of the hospital engineering services which should be under the direct supervision of the designated medical officer or the hospital superintendent.

4.5 CONDEMNATION AND DISPOSAL

It becomes imperative that every hospital must develop proper maintenance and repair facilities for hospital equipment in the manner suggested above to minimize the periodic breakdowns as well as increase the up time of the equipment to its maximum. However, over a period certain equipment either become obsolete or beyond economic repair and occupy precious space in the respective departments or in the hospital on the whole. These equipment need to be condemned and disposed off at regular intervals.

Continuous use and exploitation of equipment and various other factors including environment cause its progressive wear and tear and finally render it unserviceable. Lack of trade support for old equipment and rapid pace of technological development further influence the expected useful life of the equipment.

At present no provisioning action of non-expendable stores can take place unless these are declared unserviceable/BER (Beyond Economic Repair). As the process of provisioning takes at least 2 years, this often leads to serious deficiencies of vital equipment at unit level. It is proposed to remedy this lacuna by initiating programme of periodical phasing out of all equipment in relation to its anticipated life.

Anticipated/expected life of equipment is to be used only as a guide. It is neither a Death Warrant nor an insurance for the life of the equipment. While proper and careful use may prolong the useful life of an equipment, certain unforeseen factors may render it BER/ unserviceable within a few weeks of its procurement. Therefore, the concept of anticipated life and discard policy is to be used with utmost discretion by repair and maintenance agencies.

Frequent and recurring defect, failure of equipment, unreliability of its performance and reduced and unacceptable levels of accuracy in certain cases may lower the confidence of the user in its employability. Unreliable performance and frequent failures may thus render it unusable and necessitate its replacement. Depending upon the nature of the equipment the state of its fitness should be well known to the repair/maintenance agency. When the repair agency is convinced that the equipment is beyond economic repairs, discard action should be initiated. In the meantime all attempts to repair the equipment must be made. The equipment must be declared as unserviceable/BER after all attempts to repair it have failed.

It has also been seen that the condemnation procedures are not being undertaken on a regular and periodical basis for the following reasons:

a) lack of adequate record and other details with respect to date of procurement, purchase cost, source, and cost incurred on maintenance, repair etc.

b) The unwillingness and reluctance on the part of the senior hospital authorities to take decision for condemnation and disposal of equipment.

In view of the above, it is essential that the proper procedures should be laid down for condemnation and disposal of hospital equipment. It is also essential that proper records with respect to every expensive equipment should be maintained to facilitate their effective and efficient use and ultimately justify their condemnation and disposal.

Minimum criteria to be followed for condemnation and disposal of equipment is given below:

The equipment has become:

a) non-functional and beyond economical repair
b) non-functional and obsolete
c) functional but obsolete
d) functional but hazardous
e) functional but no longer required.

Procedure for Condemnation

Purchase and maintenance records of all costly and sophisticated equipments should be maintained in the form of a separate history sheet and logbook for each equipment. The contents and format of the history sheet are given here under:

History Sheet of Equipment to be maintained for every equipment and should incorporate:

- Identification data i.e. make, model and date purchased
- Details of sources and reputation of suppliers
- Availability of spares
- Purchase cost
- Details of breakdown and down time
- Repairs undertaken and expenditure incurred
- If imported details thereof (custom clearance)
- Details of procurement procedure.

The History sheet may have the following tabular format:

Sl. No.	Name of Firm with Address & Tel. No.	Name of Local Servicing Agent	Quantity	Cost	Date of Receipt	Date of Breakdown	Date of Repair	Remarks
1	2	3	4	5	6	7	8	9

A column may be added for determining the life of equipment at purchase.

Items like disposables and I.V. sets, linen, patient cot, and related furniture items, bowels and trays etc. can be condemned on the recommendation of the user department.

Condemnation Committee

A Condemnation Committee should be constituted for assessing whether or not an equipment should be condemned and disposed off based on the history sheet and the recommendations of the user department. This committee should meet periodically at regular intervals, at least twice a year. The condemnation committee may consist of:

1) Designated Medical Officer-in-charge
2) Concerned Head of Department
3) Technologist in-charge of Maintenance Cell
4) Stores-in-charge

However, for condemnation of costly hospital equipment, a special condemnation board may be constituted as per rules of the organisation. Any of the following procedures can be adopted for **disposal** of equipment after condemnation.

a) Circulate within the hospitals, wards and OPD
b) Return to vendor if he is willing to accept
c) Sell to other hospitals
d) Sell to scrap dealers

e) Local destruction

f) Auction

Check Your Progress 3

.....

Equipment Audit

Another requisite for an efficient system of equipment management is to carry out the equipment audit. In other words, there is a need for periodic evaluation of the quality of performance of equipment in a hospital. It is hoped that if such an audit is performed, it will be advantageous to all concerned viz., hospital, professionals, Government and the management so that, better utilisation of scarce resources is ensured and it will also contribute to the improvement of quality of hospital care.

The stages involved in equipment audit are as under:

a) **Procurement:** The steps involve the checking for:
   - Justification for the purchase of equipment including the technical specifications provided, with the help of indents received for the purpose from the user department.
   - Suitability of the specification in the supply order the choice of supplier to whom the order has been placed through tenders floated and quotations received.
   - Receipt of equipment as per the specification in the supply order, and
   - Ensuring availability of the essential spares, after sales maintenance service and the training to be provided by the supplier to the hospital staff for efficient use of the equipment wherever required.

b) **Installation and commission** involves checking with the help of history sheet whether the installation instruction viz. Safety, electrical instructions, etc. has been followed.

c) **Performance:** After having gone through the above steps, the performance aspect of the equipment audit should be checked with the help of the history sheet and logbook. The user department itself should also review the history sheet and logbook periodically.

Equipment Audit Committee

The equipment audit committee may consist of medical officer-in-charge, user department, head of maintenance cell and the matron. The equipment audit committee shall elect its own Chairman and the Secretary from amongst the members in the first meeting and then meet periodically — minimum once in six months — to perform equipment audit based on the history sheet of the equipment. Maintenance of history sheet and its subsequent write-up is essential for performance of equipment audit by the Committee.

Some of the advantages of equipment audit are as under:

a) To evaluate the concurrent performance and utilisation.

b) It provides a satisfactory mechanism to assist the process of condemnation.

c) The equipment audit reports provide an objective method for procurement of equipment in future.

d) To identify inadequacies and recommend remedial measures.

e) Cost per reportable result and cost effectiveness can be evaluated.

Training and Development

There is an urgent need for developing and conducting regular inservice training programmes for technicians and other paramedical personnel who are engaged in the day-

to-day operation of hospital equipment in various departments.

Training in hospital equipment can be broadly classified under the following categories:

1) Training by the supplier of the equipment dealing with its operation.
2) Training within the hospital dealing with routine maintenance/repairs.
3) Training outside the hospital in a recognised institution dealing with maintenance/ repairs for electronic equipment.

Important elements in the training and development of the technicians include:

a) Training the technicians in quality management.
b) Education of technicians on the repair/maintenance policy, objectives and concepts of patient satisfaction.
c) Awareness programmes for new entrants (induction training programme).
d) Procedures for specifying and verifying that technicians received suitable training.
e) Teamwork and communication methods.
f) Assessing carefully the technicians requirements and subsequently providing assistance and encouragement.
g) The performance evaluation of technicians to assess their development needs and potential.

This training may be provided in different modules. Some of which may be of the following types:

a) Use and practice of equipment including proper handling of the equipment.
b) Preventive maintenance and trouble shooting.
c) Following the instructions manual in day to day use of the equipment
d) Use of tool kit
e) Knowledge about common and recurrent causes of breakdown.
f) Identification of common spare parts which are responsible for frequent breakdowns such as fuses, washers, nuts and bolts etc.
g) Inspection and routine maintenance: Daily/periodic check/servicing schedule with information on all aspects of inspection – removing, dismantling, cleaning, examining, lubricating, assembling, adjusting, testing and reassembling of equipment/system where required.
h) Calibration
i) Testing and safety guidelines
j) Basic concepts of physics and electronics as relevant to hospital equipment.
k) Technology upgradation.

To sum up, suitable mechanism should be developed with requisite infrastructure for evaluating the performance of the maintenance cell and other departments relating to procurement, utilisation, maintenance, repair and condemnation/disposal of the equipment. The feedback arising out of such evaluation should be recorded and made use of in improving the quality-related activities of equipment management in future.

.....

2) Fill in the blanks:

a) The Equipment Audit Committee should meet for a minimum of ..... in six months.

b) Proper maintenance of ..... is essential for the proper functioning of Equipment Audit Committee.

4.6 LET US SUM UP

In this unit, you have learnt about the existing status of hospital equipment in the governmental set-up. The non-functioning of a good percentage of the equipment for want of timely and proper repair and maintenance leading to blockage of funds and idle equipment has been explained. This has been used to emphasize the necessity of planning timely and proper preventive maintenance and maintenance in respect of costly equipment in the hospitals.

The need of timely proper condemnation and disposal thereafter of equipment to facilitate early replacement has also been discussed. The necessity of proper training for the staff to improve equipment utilisation has also been touched upon. You have also been exposed to the growing awareness in the use of equipment audit as a management tool.

2) a) Once
   b) History Sheet

NOTES

UNIT 1 BREAK EVEN ANALYSIS

Structure

1.0 OBJECTIVES

After going through this unit you should be able to:

- discuss the major Cost Volume Profit (CVP) analysis technique known as break even analysis;
- apply the break even analysis with a view to determine the level of sales needed to be achieved to avoid losses;
- determine sales level required to earn a target profit;
- determine sale price needed to avoid losses; and
- determine further BEP with the changed conditions to avoid loss.

1.1 INTRODUCTION

During the course of your study, you must have learnt about the importance of Cost Volume Profit (CVP) analysis. You must have also learnt about break even analysis the most widely known form of CVP analysis. In this unit we will firstly revise the basic concept and theory and then work on practical exercises. This will enable you to prepare and present break even analysis in various formats in support of your proposals in the course of your duties as managers. The purpose of this unit is essentially to help you prepare for the actual application of the theory in practical form.

1.2 BROAD CONCEPT OF BREAK EVEN ANALYSIS

An important indicator of an organisation's performance is the profit. An analysis of the effects of various factors on profit is an essential step in financial planning and decision making.

A break even analysis is a specific technique of studying and presenting the inter-relationship between costs, volumes and profits. It is an efficient and effective method of financial reporting and planning.

At the start of any financial activity for profit say introduction of a new facility in a hospital; it becomes logical and essential to analyse with facts and figures to whether the venture would be profitable in near future. However, before the actual profit, one would come to a point of level of operation where there is no profit or loss i.e. the costs and revenues of the activity have become even and further efforts would take the organisation on the profit side. This is a point of equilibrium and is commonly known break even point. Thus the break even point is that point of sales volume for a given project or activity at which there is no profit and no loss i.e. total revenue is equal to total cost. For the purpose of further studies it is essential to know about the fixed costs, variable costs, total costs and contribution. These are briefly explained in subsequent paragraphs before taking up practicals.

Fixed Costs

These are the costs that cannot be avoided and are essential for the business. These remain fixed irrespective of the changes in the volume i.e. the number of units of goods produced. For example, the total rent of hospital facilities may be Rs. 1 lakh a year. This cost will remain the same whether patient traffic is zero or 1,00,000 patients. In nursing home the rent will have to be paid irrespective of number of x-ray images or other clinical tests performed. The other examples are:

a) Depreciation

b) Insurance

c) General administrative expenses like salaries, and maintenance of office

d) Repairs and maintenance

Variable Costs

These are the costs (expenses) which vary in direct proportion to the changes in volume of production. The examples are:

a) Cost of raw materials; say x-ray film the quantity of which will go on increasing in direct proportion to the x-ray images made.

b) Direct labour cost.

c) Direct activity cost say electric power, which will go on being consumed in direct proportion to the number of units of goods or number of units of service provided say with every x-ray image made.

d) Commission payable on unit basis.

Variable costs are those that go on increasing in direct proportion to the production activity. The recovery of this cost is by the way of sales. Each unit of product sold will cover its own variable cost and leave a balance to cover fixed costs and profit.

Contribution

This difference between selling price per unit and variable cost per unit is called contribution per unit or simply unit contribution. The sum total of all unit contribution is called 'Total Contribution'. The total contribution is contribution per unit multiplied by number of units produced. In break even point the total contribution is equal to the fixed cost. Thus at break even point the fixed cost has been overcome by the contribution and any further activity would have additional contribution to generate profit. In a break even analysis we would determine this point break even point (BEP).

Contribution Ratio: The contribution ratio is defined as contribution divided by the selling price. It can also be written as

$$\text{Contribution ratio} = \frac{\text{Selling price} - \text{Unit Variable cost}}{\text{Selling price}}$$

$$= \frac{\text{Sales} - \text{Variable cost}}{\text{Sales}}$$

1.3 APPROACHES TO COMPUTE BREAK EVEN POINT

There are two approaches to determine the break even point. These are (a) the formula approach and (b) the chart approach as described in succeeding paragraphs.

1.3.1 Formula Approach

This approach stems from a very simple logic as under :

Unit selling price – unit variable cost = unit contribution

Unit contribution × units sold = total contribution

Total contribution = total fixed cost + profit

At break even point (BEP), the profit by definition is zero, and hence, total contribution will be equal to total fixed cost. The BEP can be expressed in term of number of units sold, or in terms of rupees of sale or as a percentage of the total estimated/budgeted sales. This is brought in subsequent paragraphs.

1.3.2 Determination of BEP as Number of Units/Events

BEP (units) = (Total Fixed Costs) / ((Selling price) – (Variable costs per unit)) ... (1)
= (Total Fixed Costs) / (Unit Contribution) ... (2)

The above equations will give the units required to be produced and sold so that the break even point is achieved. The following example will illustrate the point:-

Example 1

A nursing home laboratory has priced its x-ray test and report for Rs. 200/- each. The variable cost is Rs. 120/ per test. The annual fixed cost is Rs. 2,40,000/-. Find out the number of x-ray tests to be performed per year at break even.

Solution

Total fixed cost = 2,40,000

Unit selling price = 200

Unit variable cost = 120

Therefore BEP (units) = 240000/(200 – 120) = 3000 as per Eqn. 1

Thus a minimum of 3000 x-ray tests must be carried out so that the nursing home breaks even.

Example 2

A manufacturing firm produces a single product whose selling price is Rs. 100/- per unit and a variable cost of Rs. 60/-. The annual fixed cost is Rs. 10,00,000/-. How many units the firm must produce at BEP.

Solution

Total fixed cost = 1000000

Unit selling price = 100

Unit variable cost = 60

Unit contribution = unit selling price – unit variable = 100 – 60 = 40

Therefore BEP (units) = 100000/40 = 25000 numbers as per Eqn. 2

Thus a minimum number of 25000 must be produced so that the firm achieves breaks even point.

1.3.3 Break Even Point in Rupees Term

In the above examples we have calculated the break even point in terms of number of units of the product. It is sometimes convenient to express the BE point in terms of monetary value i.e. in terms of say rupees of sale. One way would be to calculate in terms of number of units and then multiply with the sales price. In the Example 2 above the number of units at BEP is 25000. The corresponding value of BEP sales can be calculated by simply multiplying by 100 (sales price) i.e. 25000 × 100 = Rs 25,00,000/-.

Alternatively by simple mathematics this value can be expressed with the following formula:

BEP (rupees) = Total fixed cost/contribution ratio ... (3)

The term contribution ratio is defined as (unit contribution/selling price). Thus,

Contribution ratio = Unit contribution/selling price

= (Selling price – unit variable cost)/(selling price) ... (4)

= 1 – (unit variable cost)/(selling price)

= 1 – (total variable cost)/(total sales) ... (5)

Apply Eqn. 4 above

Contribution ratio = (100 – 60) ÷ 100 = 0.40

BEP (rupees) = 10,00,000 ÷ 0.40 = 25,00,000 as calculated above.

1.3.4 Break Even Point as a Percentage of Capacity

Many a time it may be required to compute the BEP as a percentage of the capacity. In this case we need to know additional information about the estimated capacity (units)/ budgeted sales. Assume in the Example 2 above the budgeted income from an ECG equipment is Rs. 40,00,000/- which correspond to the estimate usage of 40,000 times at the assumed selling price of Rs. 100/-. We can summarize the data as under :

a)	Estimated budgeted sales	Rs. 40,00,000
b)	Estimated usage in units	40,000 times
c)	Actual sales at BEP	Rs. 25,00,000
d)	Actual sales units at BEP	25000 nos.
e)	Fixed cost	Rs. 10,00,000
f)	Selling price	Rs. 100
g)	Unit variable cost	Rs. 60
h)	Unit contribution 100 – 60	Rs. 40
j)	Total contribution 40 × 40000	Rs. 16,00,000

BEP (% of capacity) = (BEP (units)/Sales (units)) × 100

= (25000 ÷ 40000) × 100 = 62.5 %. Also

= ((Actual sales at BEP) ÷ (Estimated Budgeted Sales)) × 100

= (25,00,000 ÷ 40,00,000) × 100 = 62.5%

This can also be expressed in a simple formula as under:

BEP (% of capacity) = (Fixed Cost) ÷ (Total contribution) × 100 ... (6)

= (10,00,000) ÷ (16,00,000) × 100 = 62.5 %

Thus you have seen that in the above examples we have calculated the BEP in terms of number of units of sales in rupees term and as a percentage of Budgeted sales or estimated number of units i.e. as a percentage of capacity over a period of time usually a year. Now we will solve Example 2 by means of chart.

1.4 CHART APPROACH

A graphical presentation, which gives a pictorial view, is far more quickly and easily understood by the senior manager whose time is at premium. A break even chart is thus a convenient tool of BEP analysis. The chart basically consists of drawing a two dimensional chart showing costs and revenues Y-axis (vertical) on and volumes on the X-axis (horizontal). We will plot the above data in the chart by drawing the following as under :

a) **Sales volume lines** : Sales volumes are plotted on X-axis. Sales volumes may be expressed in rupees, units or as a percentage of capacity. Convenient equal distances are marked along X-axis to show sales volume at different activity level i.e. 0, 8,16,24,32,40 lakhs, and 0,8,16,24,32,40 in thousand of numbers. We can also mark these in percentage of sales i.e. 0,20,40,60,80,100.

b) **Cost and revenue lines** : The fixed, variable costs and revenues from sales are plotted on the Y-axis, which correspond to the activity level. These can be plotted in Rs. lakhs from Rs. 0 to Rs. 40 lakhs. A similar vertical line may also be drawn on the right hand side of the chart to complete the square.

c) **Fixed cost line** : As the fixed cost does not change in value it becomes a horizontal line parallel to the X-axis at the fixed cost point. In an alternative form this can be drawn marking fixed cost on both sides of the variable cost line and joining the same. The fixed cost is Rs. 10,00,000 (10 lakhs). This can be represented by 10 units.

d) **Variable cost line** : This line can be drawn starting from the origin i.e.point (0,0) rising upto the total variable cost marked on the right hand side corresponding to the budgeted sales in Rs./units. In our case this value is Rs. 24,00,000/- at Rs. 40,00,000 sales/40,000 units. Alternatively the start point of this would be above the fixed cost line and end point Rs. 10 lakhs + Rs. 24 lakhs = Rs. 34 lakhs.

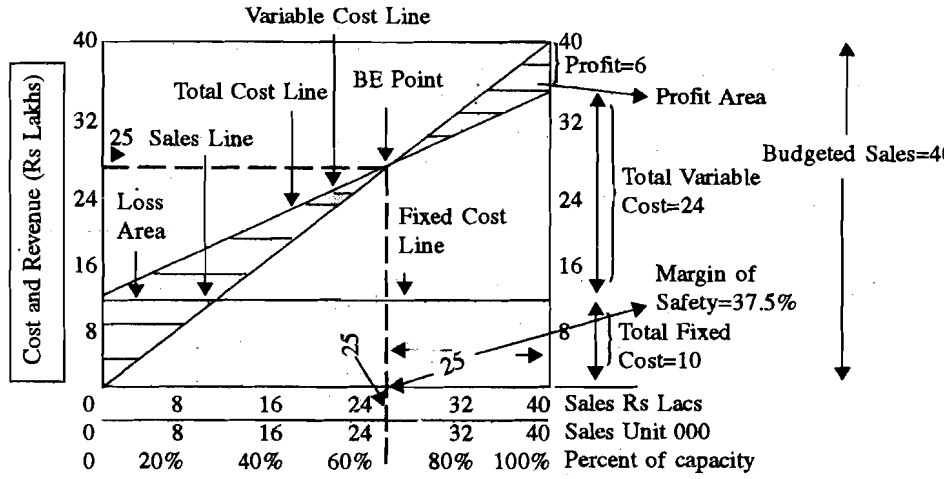
e) **Total cost line** : As the total cost represents sum of fixed and variable costs, this can be drawn either by drawing the variable cost line first and the marking fixed cost over it on both left hand and right hand side or drawing the fixed cost line first and then marking variable cost (0) on the left hand side and Rs. 24,00,000 on the right hand side. In both the cases the final line would be the same. LHS Rs. 10,00,000; RHS 10,00,000 + 24,00,000 = Rs. 34,00,000.

f) **Sales line** : As the name suggests this line shows sales revenue on the Y-axis plotted against the volume at the X-axis. In our case the line will start from the origin and join on the right hand Y-axis at budgeted sales; in our case this is Rs. 40,00,000.

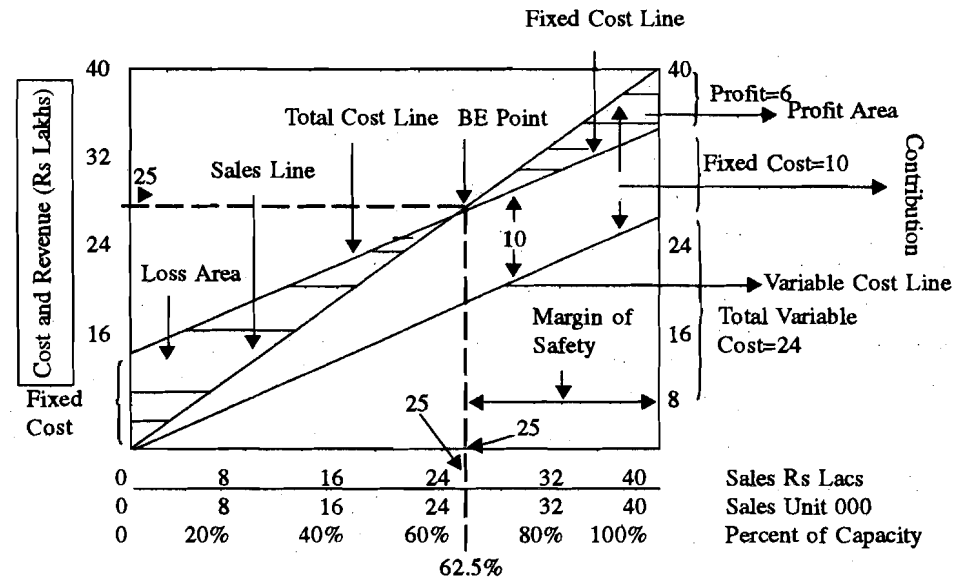
g) **Profit** : The difference between the Sales Revenues and the Total Cost is profit. It would be seen the sales and the total cost lines intersect. At the point of intersection the value total cost is equal to sales revenue thereby meaning that the profit at this point is zero. This is thus the BE point. The BE point can be scaled and easily seen in terms of rupees, units or percentage of capacity.

h) Both alternative forms of charts have accordingly been drawn below.

Alternative Chart 1 with Variable Cost above the Fixed Cost Line



Alternative Chart 2 with Fixed Cost Line above the Variable Cost Line



It would further be seen from these charts that before the BE point the total cost line is above the sales revenue line meaning thereby that the cost is more than the revenue hence there is loss upto this point. However beyond this the sales revenue line is above this point hence there is profit beyond this point. The area on the left of the break even point is the "Loss area" while to the right there is profit area. A comparison of both the alternative charts would indicate that there is no changes in the sales line, total cost line and break even point. Only the fixed and variable cost lines have changed. It would also be noticed that in addition it also indicates the value of contribution at different levels of sale. At BE point the contribution is equal to the fixed cost.

1.5 MORE ON BREAK EVEN ANALYSIS

In examples 1 and 2 consolidated figures for the fixed and variable cost have been given. This was to present a simplified understanding of the break even analysis. Now we will examine the same example in greater detail nearing the practical problems. The same data has been detailed as under:

S.No	Description	Rs.	Rs.	Rs.
1)	Estimated Sales	40,000 units @ Rs. 100		40,00,000
2)	Variable Costs	a) Direct materials	8,00,000	
		b) Direct labour	10,00,000	
		c) Consumption of electric power in manufacturing (E)	3,00,000	
		d) Commission on sales (C)	3,00,000	24,00,000
3)	Fixed Costs	a) Factory rent (R) @ 30,000 pm	3,60,000	
		b) Depreciation (D)	50,000	
		c) Fixed Administrative charges i/c insurance and maintenance (FA)	5,90,000	10,00,000

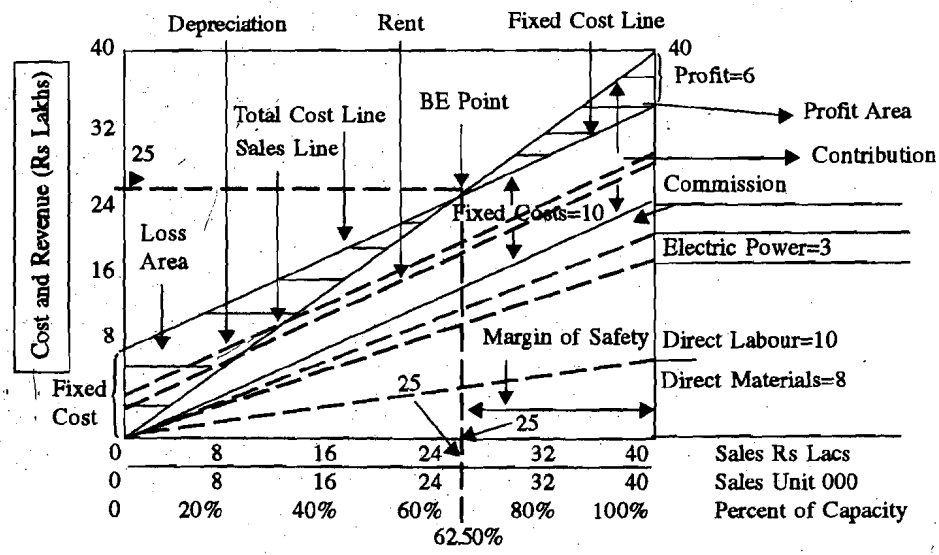
We shall draw a detailed BE chart by the following steps:

a) Draw the sales line as done in the earlier at alternatives 1 and 2

b) Mark variable costs on the Y-axis one over the other and join these points to the origin. The top most line will become the total variable cost line as before.

c) On both sides of the variable cost line mark fixed costs one above the other and join these points. The resultant line would become the total cost line and would intercept the sales line at BEP. This detailed chart 3 is given below :

Chart 3



Even though as expected there is no change in the BE point but detailed graphical presentation gives a direct appreciation of the breakup of costs. You would observe that the above chart shows separate lines for every individual cost and effect of each on the final fixed and variable cost and total cost. On examining this BE chart a manager would visualize the various costs. For instance a reference to the graph he may think of having an own building rather than to go on paying high rent or he may consider to cut down the direct labour or direct materials cost. Additionally the chart above also shows the following:

a) **Profit** : This is indicated by the intercept between the total cost line and the sales line. It would also be seen that before the BEP there is no profit and the profit zone starts only from this point onwards. In case of the above chart the profit in lakhs is 6. By actual measurement you can read the profit at any sale level. It would be observed from the chart that in order to increase the profit, either the sales line should be higher or the total cost line should be lower or a combination of both.

b) **Contribution** : The value of contribution, which is represented by the intercept between the sales line and the variable cost line. A closer look would also indicate that this value is equal to the total fixed cost plus the profit. At BEP this value is equal to the total fixed cost. This has already indicated in the formula approach.

c) **Margin of safety** : The excess of actual or budgeted sales over the break even point is known as margin of safety. In case of the above chart equal to 40,000 – 25,000 = 15000 units, which correspond to Rs. 15,00,000 of sale and 100 – 62.5 = 37.5% capacity. This value is indicative of the extent to which the sales may fail before the firm suffers a loss. It therefore follows that larger the margin of safety, safer would be the firm. In order to increase the margin of safety, it would be seen from the chart above that the BEP be lowered for which again either the sales line should be higher or the total cost line should be lower or a combination of both.

Break Even Analysis for a Target Profit

As already explained, at the BEP the profit is zero. The difference between the sales in excess of the break even sales and the variable cost is the organisation profit. The reason is that the total fixed cost has already covered at break even point; therefore, any extra sales will simply add to the profit (after deducting variable costs). This can also be seen from the charts above that the profit is the vertical distance between the sales line and the total cost line is the profit and at the BEP it is zero. It would also be seen from the chart that Fixed cost + Profit = Contribution.

This equation can be written as under:

Contribution = Fixed cost + Profit

Sales volume × Contribution ratio = Fixed cost + Profit

$$\text{Therefore, Sales Volume (to earn desired profit)} = \frac{\text{Fixed cost + Profit}}{\text{Contribution ratio}}$$

Thus, if the desired profit is to be achieved we can apply the above formula to calculate the same. In our previous example the profit as seen from the chart is Rs. 6 lakh i.e. Total sale – Total cost = 40 – (24+10) = 6. Suppose we target a profit of Rs. 10 lakhs, what should be the increased sales; various cost remaining the same.

Solution

Sale price per unit	=	Rs. 100/-
Variable cost per unit	=	Rs. 60/-
Unit contribution	=	100 – 60 = 40
Contribution ratio	=	$\frac{\text{Unit contribution}}{\text{Sale price}}$ 40 ÷ 100 = 0.40
Fixed cost	=	Rs. 10 lakhs
Sales volume	=	$\frac{\text{Fixed cost + Profit}}{\text{Contribution ratio}}$ (10+10) ÷ 0.4 = 50 i.e. Rs. 50 lakhs

Thus instead of a sale of Rs. 40 lakhs with a profit of Rs. 10 lakhs in the previous case, the sale should be Rs. 50 lakhs for a target profit of Rs. 10 lakhs. This corresponds to a sale of 50000 units instead of 40,000 units in the previous case. The sales must be increased by ((50 – 40) ÷ 40) × 100 = 25%.

Let us now check the above

Total Sale amount for 50,000 units @ Rs 100/- per unit	=	50,00,000
Fixed cost	=	10,00,000

Variable cost for 50,000 units @ Rs 60/- per unit = 30,00,000

Total Cost = fixed cost + variable cost = 10,00,000 + 30,00,000 = 40,00,000

Profit = Total Sale amount – Total cost = 50,00,000 – 40,00,000
= 10,00,000 i.e. Rs. 10 lakhs

Exercise 1

With the revised data of sales draw a BE chart to indicate

a) Cost and sales line

b) BEP in terms of units, rupees, as percentage of sales

c) Profit and loss zones

d) Profit

e) Contribution

f) Margin of safety

Thus we have learnt how to apply break even analysis to determine the sale so as to achieve target profit costs and sales price remaining unchanged. Now we will foresee a situation where it is not possible to increase the production i.e. 40, 000 units and cost and target profit is to be achieved. It now required to determine the Sale price to achieve a profit of Rs. 10/- lakhs.

Solution

Variable cost per unit = Rs. 60/-

Variable cost for 40,000 units @ Rs. 60/- each = 40,000 × 60 = 24,00,000 i.e. 24 lakhs

Fixed cost = Rs. 10 lakhs

Total cost = 24 + 10 = 34 lakhs

Target profit = Rs. 10 lakhs

Total sales = total cost + profit = 34 + 10 = 44 lakhs. Therefore sale price = 44,00,000 ÷ 40,000 = 110 i.e. Rs. 110/- each. The selling price should be increased by 10% to get a target profit of Rs. 10 lakhs.

Thus it would be seen that for the same target profit, the number of units had to be increased by 25% in the first case and the same has been achieved by only 10% increase in the selling price. Increase in selling price does increase the profit faster but the price is determined by the market forces and at higher price the product may not sell.

1.6 A CASE STUDY FOR INSTALLATION OF A NEW FACILITY IN A NURSING HOME BY BREAK EVEN ANALYSIS

A nursing home plans to install ultra sound equipment in their existing complex but have to construct an extension of the building. They have planned to take loan from the bank, purchase and install equipment, recruit staff for this facility. The current price for this test in the area is between Rs. 400-450/-. After studying the various aspects the following data emerges:

S.No	Description	Amount Rs.	Remarks
1)	Cost of equipment	500000	Including installation
2)	Cost of extension of the building	500000	Extension on existing land
3)	Cost of new furniture	30000	
4)	Salary of staff and other incidentals	300000	

5)	Loan from the bank	1050000	
6)	Yearly installment of loan	200000	
7)	Rate of depreciation per year (equipment)	20%	
8)	Rate of depreciation per year (building)	2%	
9)	Rate of depreciation per year (furniture)	15%	
10)	Other incidentals; property tax, maintenance of equipment, building, furniture and administrative expenses.	300000	
11)	Average number of tests that may reasonably be expected to be carried out per day	12	
12)	Average working days in a year	275	
13)	Market price per test	400-450	
14)	Cost of electricity per test	50	
15)	Other consumable and stationery per test	50	
16)	Targeted profit after tax	200000	
17)	Tax rate	20%	

It is proposed to charge @ Rs. 400/- per test. It is required to examine if the price planned is feasible. If not what should be the price per test.

Solution

	Fixed Costs			
1)	Yearly installment of loan	200000		
2)	Depreciation equipment 5,00,000 @ 20%	100000		
3)	Depreciation building 5,00,000 @ 2%	10,000		
4)	Depreciation furniture 30000 @ 15%	4500		
5)	Other incidentals; property tax	300000		
6)	Salary of staff and other incidentals	300000		
	Total Fixed Cost	**914500**		
	Variable Costs			
1)	Cost of electricity per test	50		
2)	Other consumable and stationary per test	50		
3)	Variable cost per test (1) + (2) above	100		
4)	Total number of test per year = no. of test per day × average working days =12 × 300 = 3600	3600		
5)	Total Variable Cost = (3) × (4)	360000		
	Profit			
1)	Targeted Profit after tax	200000		
2)	Profit before tax = 200000 ÷ (1 – 0.2) = 250000	250000		
	Sales Revenue			
1)	Proposed charges per test	400		

Contribution per test = proposed charges per test – variable cost per test = 400 – 100 = 300

Total contribution = contribution per test × No. of tests proposed = 300 × 3600 = 1080000

Fixed cost + proposed profit after tax = 914500 + 250000 = 11,64,500

Against the above figure of 11,64,500, the total contribution expected is only 10,80,000 thus there is a shortfall of 11,64,500 – 10,80,000 = 84500/-

It is seen that the proposals falls short of the expectation and requires additioffal revenue of Rs. 84500/-. This can be met by increase in the proposed price per test. This increase is = 84500 ÷ 3600 = 23.47 say Rs. 24/-

Therefore, the proposed price per test = 400 + 24 = 424/-

Let us now find out the BEP.

BEP units = (Total Fixed Costs)/((Selling price) – (Variable costs per unit)) ... (1)

= (Total Fixed Costs)/(Unit Contribution) ... (2)

With the increase in the price to Rs 424, the unit contribution would be 424 – 100 = 324

Therefore, BEP units = 914500 ÷ 324 = 2882 nos. Thus after carrying 2882 tests the Nursing home would be breaking even i.e. at no profit, no loss situation. This would incidentally after 2882 ÷ 300 = 9.6 months after the yearly plan of 300 test per year.

You are now required to find:

a) BEP in rupee term.

b) BEP as a percentage of capacity.

c) Draw a BEP chart and verify.

1.7 A CASE STUDY FOR COMPARISON OF TWO PLANS FOR RUNNING OF A DIETARY SERVICE IN A HOSPITAL

Break even analysis is a simple tool for financial analysis so as to make a right decision in business proposals when more than one alternative is available. Here is a case study for a hospital that wants to run dietary service by constructing an extension to the existing building. The management has visualized two practical options as under:

a) Purchase, install and maintain costly kitchen equipment with completely running the catering. The furniture and building including its maintenance has also be carried out by them. Further they plan to take loan from a bank and pay fixed annual repayment that includes interest and return of principal.

b) Get into a contract with a firm who is willing to install the kitchen equipment (including the cost of the equipment and cost of installation) and maintain it in good working condition at a fixed commission per meal. The hospital will however make provision of building, furniture including its maintenance as in the previous option.

The problem has to be analysed by break even analysis to select the better option financially.

The data and calculation of profit in both the cases is given in the following tables:

Option 1

S.No.	Description Plan 1	Amounts	Fixed costs	Remarks
1)	Cost of kitchen equipment	5,000,000		
2)	Depreciation of kitchen equipment @ 15% per year		750000	

3)	Cost of extension of the building	1,000,000		
4)	Depreciation of building cost @ 2% per year		20000	
5)	Cost of new furniture	200000		
6)	Depreciation of furniture cost @ 2% per year		30000	
7)	Loan from the bank	7500000		
8)	Yearly installment of loan		1000000	Includes interest and principal
9)	Salary of maintenance staff for equipment	2000000	200000	
10)	Salary of maintenance staff for building	1000000	1000000	
11)	Salary of cooks, waiters and other kitchen staff	1200000	1200000	
12)	Administrative charges	60000	60000	
	Total Fixed cost		**4,260,000**	
	Variable costs		**Variable costs**	
1)	Cost of materials per meal		20	
2)	Cost of electricity, water etc.		3	
			23	
3)	Sale price per average meal = 55	55	**55**	
	Contribution			
1)	Contribution per meal = 55 – 23		32	
2)	Average No. of meals per day = 450			
3)	Total contribution per year = 32 × 450 × 365 =		5,256,000	
	Profit before Tax			
1)	Profit = Total Contribution – fixed cost			
	4260000 – 5356000		996,000	
2)	Tax rate = 30%			
3)	Tax = 996000 × 0.30 =		298,800	
4)	Net profit after tax = 1374750 – 41425=		**697,200**	

Option 2

S.No.	Description Plan I	Amounts	Fixed costs	Remarks
1)	Cost of kitchen equipment	0	0	being supplied by the contractor
2)	Depreciation of kitchen equipment @ 15% per year	0	0	Contractors' equipment
3)	Cost of extension of the building	1,000,000		
4)	Depreciation of building cost @ 2% per year		20000	

5)	Cost of new furniture	200,000	
6)	Depreciation of furniture cost @ 2% per year		30000
7)	Loan from the bank	1,200,000	
8)	Yearly installment of loan		160,000
9)	Salary of maintenance staff for equipment	0	0
10)	Salary of maintenance staff for building	1000000	1000000
11)	Salary of cooks, waiters and other kitchen staff	1200000	1200000
12)	Administrative charges	40000	40000
	Total Fixed cost		**2450000**

	Variable costs		**Variable costs**
1)	Cost of materials per meal		20
2)	Cost of electricity, water etc.		3
3)	Payment per meal to the equipment contractor		10
4)	Total variable cost per meal		**33**
	Contribution		
1)	Sale price per average meal = 55	55	**55**
2)	Contribution per meal = 55 – 23		**22**
3)	Average No. of meals per day = 450		
4)	**Total contribution per year = 22 × 450 × 365 =**		**3,613,500.00**

Profit

Profit before tax = Total contribution – Fixed cost = 1,163,500.00

3613500 – 2450000

Tax rate = 30%

Tax = 1153500 × 0.30= 349050

Net profit after tax = 1374750 – 41425 = **814,450.00**

Summary

	Option 1	Option 2	
Loan from bank	7500000	1200000	
Profit after tax	697,200	814450	
Maintenance of equipment	hospital	contractor	Clearly option 2 is more profitable and logical better option.

Thus we have seen that by break even analysis we can come to logical financial conclusions.

1.8 LET US SUM UP

The break even analysis is a most widely form of cost volume profit analysis. It indicates the level of sales at which the total revenues are equal to the total costs. For the purpose of this analysis the various costs are divided in two parts i.e. fixed costs and the variable costs. The fixed costs are the costs that cannot be avoided and are essential for the business. These remain fixed irrespective of the changes in the volume i.e. the number of units of goods produced such as rent, insurance etc. Variable costs are expenses, which changes in direct proportion to the changes in volume of production like raw materials etc. For every unit of goods produced the sale/activity generate revenue and the difference of the price minus variable cost is called unit contribution. The following simple equations lead to its determination applications to study cost, volume and profit analysis:

Unit selling price – Unit variable cost = Unit contribution

Unit contribution × units sold = Total contribution

Total contribution = Total fixed cost + Profit

At BEP the profit is zero and hence at this point, Total contribution = Total fixed cost. This is known as the formula approach.

Apart from the formula approach the financial analysis can be effectively presented in chart form for easy understanding. A BE chart essentially consists of (a) Sales line, (b) Fixed costs line, (c) Variable costs line. The chart also shows BEP (no profit, no loss point), loss area, profit area, contribution, and margin of safety. Thus a chart becomes specific technique of studying and presenting the inter-relationship between costs, volumes and profits. It is an efficient and effective method of financial reporting and planning and easily understood by the senior executives when compared to accounting data.

You would have also persued two case studies specific to a hospital and learnt how:

- to determine the level of sales needed to be achieved to avoid losses;
- to determine sales level required to earn a target profit;
- to determine sale price needed to avoid losses; and
- to determine further BEP with the changed conditions to avoid loss.

The break even analysis is based on certain assumptions like variable per unit remaining constant and thus being directly proportional to the manufacture or other business activity. Also the cost should be separated into fixed and variable costs. The selling price is also assumed to be constant and the fixed cost remaining fixed. These assumptions may not be valid as the situation may go on changing. Hence constant reviews are necessary. The breakdown of various costs must also be done with great care to represent the actual position. As a final word of caution the decision making cannot be based on this analysis alone in view of the limitations mentioned above.

1.9 EXERCISES FOR THE STUDENTS

Exercise 1

The following data has been collected after analysis of the accounts of a manufacturing firm:

S.No.	Description	Amount (Rs.) (breakup)	Amount (Rs.) (total)
1)	**Sales**		**2000000**
	Variable Costs		
1)	Raw materials	600000	

2)	Direct labour	600000	
3)	Electric power for manufacturing	60000	
4)	Commission for sales	40000	
5)	Total Variable cost		**1300000**
	Contribution = Sale – Variable costs		**700000**
	Fixed Costs		
1)	Rent	60000	
2)	Administrative expenses	100000	
3)	Total Fixed cost		**160000**
4)	Net profit before tax = Contribution – fixed cost		**540000**

You are required to compute:

a) Contribution ratio

b) BE point

c) Revised BEP, contribution ratio and profit due to planned modernization which requires an increase in the fixed cost by Rs. 40000/-. Also as a result of this modernization, the firm is expected to decrease its cost of electricity for manufacturing process by 20% and direct labour by 30%.

d) Draw BEP chart in both cases and mark the BEP in rupees and as a percentage of sales. Also mark profit and loss zones, contribution and margin of safety.

Exercise 2

Two firms A and B, deal in identical diagnostic equipment in the same market. Their budgeted profit and loss accounts for the same year are as follows:

S.No.	Description	Amount (Rs). (breakup)	Amount (Rs.) (total)	Amount (Rs.) (breakup)	Amount (Rs.) (total)
1)	**Sales**		600000		600000
	Costs				
1)	Variable costs	400000		360000	
2)	Fixed costs	50000	450000	90000	450000
	Net Profit = total sales – total cost		150000		150000

You are required to:

a) Calculate the BEP for each firm

b) State what shall be the effect on the profits with increase in demand by 10% and decrease in demand by 10%.

c) Draw BEP charts with changed conditions.

UNIT 2 PREPARATION OF FINANCIAL STATEMENT

Structure

2.0 OBJECTIVES

After going through this unit of practical manual you should be able to:

- gain more knowledge about the main financial statements i.e. Balance Sheet and Profit and Loss statement;
- prepare and present above statements in a prescribed manner with a given data; and
- interpret the above statements.

2.1 INTRODUCTION

During the course of your studies, you must have learnt about the importance of the Financial Statements or accounting reports. You must have also learnt about the two most important financial statements namely:

i) Balance sheet (or the statement of financial position)

ii) Profit and loss account (or income statement)

In this unit you will firstly be made to revise the basic concepts and theory and then to work on practical exercises. This will enable you to prepare, present and interpret these statements in the course of your professional duties as managers. The purpose of this unit is essentially to help you prepare for the actual application of the theory in practical form.

2.2 BROAD CONCEPT OF BALANCE SHEET – ASSETS AND LIABILITIES AND OWNER'S EQUITY

Balance sheet is one of the most significant financial statements. It indicates the condition or state of a business at a particular point of time. The Balance sheet contains information about the resources and obligations of a business entity and about it's owner's interest in the business at a particular point of time. Even though the balance sheet can be made for any date, these are normally made annually as on year ending 31 March to cover the accounting period of the financial year. It is a formal statement of presentation of Assets, Liabilities and Net Worth of the business firm. These are briefly explained in subsequent paragraphs for revision before taking up practicals.

Assets

These are economic resources of an organisation capable of being measured in monetary terms. These are cash, money claims, marketable securities, stock of materials, land, buildings, equipment, furniture, investments and even patents, goodwill, copyrights etc. You will learn more about it as you proceed.

Liabilities

These are economic obligations of an organisation to pay cash or to provide goods or services in some future period. These are creditors, bills payable, wages and salaries payable, interest payable, taxes payable, bonds, debentures, if issued by a corporate hospital, borrowings from banks and financial institutions. You will learn more as you proceed.

Owner's Equity

The financial interest of the owner in monetary terms is called owner's equity. Owner's equity represents owners claims against the hospital as an entity as of the balance sheet date. This is the difference of the assets minus liabilities. Initially owner(s) equity arises on account of the funds invested by the owner(s). But it changes due to the earnings of the hospital and their distribution. The owner's equity will increase when the hospital makes earnings and retains whole or part of it. If there are losses owner's equity (claim) will be reduced. It also known as Net worth of the organisation. In case of the hospital is registered with a company the owners of the organisation are called shareholders and the owner's equity is referred to as "Shareholders' Equity" or "Shareholders' Fund" or "Capital" or simply as "Share Capital".

Shareholder's equity has two parts as under:

a) **Paid up share capital** : Paid up share capital is the amount of funds directly contributed by the shareholders. If shareholders are actually required to pay more than the stated or par value of the share, the amount is separately shown as "share premium". The paid up share capital is shown unchanged in the balance sheet.

b) **Retained earnings or Reserve and surplus** : This is the difference between total earning to date and total amount dividends to date. This represents total undistributed earnings. This part is changed while making a balance sheet.

The broad concept of balance sheet derives from the equation,

$$TA = TL + OE \text{ or } TA - TL = OE$$

$$OE = SF + RS$$

Where, TA = Total assets

TL = Total liabilities

OE = Owner's equity

SF = Shareholder's fund

RS = Reserve and surplus

Thus in a balance sheet you have to balance both sides by the application of the above

equations. A balance sheet always presents liabilities and owners equity on one side and the assets on the other side. The assets are as accounted for in the books at a point of time (when the balance sheet is being made) and to balance both sides, the "Reserve or Surplus" part of the owner's equity or capital is changed.

You will learn more about the same while actually preparing balance sheet later.

2.3 BROAD CATEGORIES OF ASSETS AND LIABILITIES

In order to make and interpret a balance sheet it is important to understand the nature of assets and liabilities.

The assets are classified as current assets and long-term assets as given below:

a) **Current Assets** : These are sometimes also called liquid assets and are either held in the form of cash or are expected to be converted into cash within the accounting period. These are as under:

   i) *Cash* : Actual money in hand and cash deposit in bank accounts.

   ii) *Marketable Securities* : A firm usually invests in marketable securities when in temporary surplus in cash. These are units of Unit Trust of India, or any Mutual fund, which can be converted into cash within the accounting period.

   iii) *Book Debt (or account receivable)* : These are the amounts due from debtors (customers) to whom the goods or services have been sold on credit and are realizable within the accounting period; examples: health care contracts carried out for an organisation and payment is expected within the accounting period.

   iv) *Bills Receivable* : These represent the promises made in writing by the debtors to pay definite sums of money after some specified period of time. Bills are written by the firm and become effective when accepted by the debtors; examples: payments to be made by the organisation every month by say 7th.

   v) *Stock (inventory)* : These include stock of goods kept for serving the customers; examples : stock of medicines, bandages and other consumables required for the patients and for maintenance etc.

   vi) *Prepaid Expenses and Accrued Income* : Prepaid expenses are the expenses of future period paid in advance; examples: prepaid insurance, prepaid rent or taxes in advance. Accrued incomes are benefits that the hospital has earned but they have not been received in cash; examples: pending claims from insurance, accrued interest from the bank etc.

   vii) *Loans and Advances* : These include dues from employees or associates, advances for current supplies and advances against acquisition of capital assets. Except for the advance payment for current supplies, for advances given for purchase of machinery or x-ray items, etc., it is not proper to include loans and advances in current assets.

b) **Long-term Assets** : These are held for a period longer than the accounting period. These are held for the use of business, and are not for the purpose of sale. These are given below :

   i) *Fixed Assets* : These are tangible fixed assets, which include land, building, equipment and furniture etc. These are normally recorded at cost price. As these assets are allocated a fixed life, the value goes on reducing every year. The reduction in amount is called depreciation, which is accounted for every year in the balance sheet.

   ii) *Intangible Assets* : These include patents, copyrights, trade names, if any, and goodwill. Cost of intangible is amortized over their useful life. That is to say these too are reduced every year or in some case like goodwill may enhance every year.

iii) *Gross Net Block* : The term Gross Net Block is used to represent the original of the total fixed asset minus accumulated depreciation. This is thus depreciated cost.

iv) *Long-term Investments* : These represent firms investments in shares, debentures and bonds of other firms or Government bodies for profit and control. These investments are held for a period greater than the accounting period. Usually these are shown at the original cost.

v) *Other Assets* : All other assets, which cannot be included in any of the above categories, are grouped as other assets. Prepayments of services or benefits for a period longer than accounting come in this category and includes advertising expenditure and preliminary expenses etc.

The liabilities are classified as current liabilities and long-term liabilities as given below.

a) **Current Liabilities** : These are debts payable within the accounting period; examples : creditors, bills payable, bank overdraft, outstanding expenses and incomes received in advance. These are as under:

i) *Sundry Creditors* : These represent current liability towards all kind of suppliers from whom purchases have been made. This liability is shown in the balance sheet till payment has been made to the creditors.

ii) *Bills Payable* : These are promises made in writing by the firms to make payment to the creditors at some specific date. Bills are raised by the creditors on the firm and become payable once accepted by the firm. Bills payable have a life less than one year. Therefore, they are shown as current liabilities.

iii) *Bank Borrowing* : Amount borrowed by the firm for a short-term to be paid within the accounting period.

iv) *Provisions* : These include provision for taxes, dividend etc. to be paid during the accounting period. The taxes are calculated and provided for as a short-term liability.

v) *Expenses Payable and Income Received in Advance* : These include provision of wages, rent, commission which is payable within the accounting period. Also organisations can sometimes receive income in advance for services to be supplied. For example, payments made by clients on account of corporate health coverage for an accounting period, the services for which will be rendered in due course. As goods and services have to be provided within the accounting period, such receipts are shown as current liabilities in the balance sheet. Long-term loans are repayable periodically. The portion of loan which has is repayable within the accounting period will form part of current liability.

b) **Long-term Liabilities**: These are some-times also called fixed liabilities and are the obligations or debt payable in a period of time greater than the accounting period as under:

i) *Debentures or Bonds* : When the organisation has to raise large sum of money as debt from the public, it issues "debentures" or bonds. In health services this is a relatively less utilised practice. Interest on these has to be paid by the organisation and principal has to be returned as per the agreement. This is to be accounted for as long-term liability. The portion of the interest to be paid during accounting period will be shown as short-term liability.

ii) *Secured Loan or Mortgages* : These are long-term borrowings with fixed assets, say some building or equipment pledged as security. Mortgages are shown as secured long-term liabilities in the balance sheet.

2.3.1 Exercise 1 : To Distinguish between Assets and Liabilities

You should now be able to distinguish between the assets and the liabilities. In the table given below you may please identify, the asset and liabilities and indicate whether these are classified as long term or short term categories. A few columns have been filled. You may fill in the remaining.

	Description	Asset	Liability	Long Term	Short Term
1)	Actual money in hand	yes			yes
2)	Cash deposit in bank accounts	yes			yes
3)	Amount due from an organisation whose employees have been given medical treatment	yes			
4)	Stocks of medicine, maintenance and other consumable stores	yes		yes	
5)	Insurance which has been prepaid				
6)	Rent paid in advance				
7)	Advance tax paid	yes			yes
8)	Provision of tax		yes	yes	
9)	Accrued interest not yet received				
10)	Accrued dividend on mutual funds and shares etc.	yes			
11)	Commission payable				
12)	Overdraft from the Bank		yes		yes
13)	Advance payment made for supply of medicines, and consumable stores		yes		
14)	Supplies received from suppliers but		yes		yes
15)	Land, building, medical equipment,				
16)	Portion of long-term loan payable within the accounting period				
17)	Mortgaged assets to secure loan from the financial institutions				
18)	Portion of long-term loan payable		yes	yes	
19)	Amount spent on advertisement				
20)	Amount spent on stationery and stamps				
21)	Patents				
22)	Long-term investments in shares				

2.4 TYPES OF BALANCE SHEETS

There are two types of balance sheets namely "Accounts Form" and "Report Form". In the account form, the balance sheet has two sides i.e. Left Hand Side and Right Hand Side. The standard format is shown below:

It would be noted that the column reserves and surpluses is shaded and will have to be calculated as per the basic equation given in paragraph 2.2 to make Total Liabilities and Equity = Total Assets.

Account Form Balance Sheet					
XYZ Hospital As on 31 March 2000					
	Sch*	Rs.000		Sch*	Rs.000
Equity and Liabilities			Assets		
Share Capital			Fixed Assets		
Reserves and Surplus			Less Depreciation		
			Net Block		
Long-term Liabilities			Investments		
Current Liabilities and Provisions			Current Assets		
			Other Assets		
Total Liabilities & Equity			Total Assets		

In the report form the format is changed to give a logical sequence to show the Sources of Funds followed by the Application of Funds. In this statement you would list out, on the basis of the information in the balance sheet, where your money come from (sources of funds) and where was this money utilised (uses or application of funds). This structure is as under:

Report Form Balance sheet		
XYZ Hospital As on 31 March 2000		
	Sch*	Rs.000 (in thousands)
I) Sources of Funds		
Shareholders Funds		
1) Share Capital		
2) Reserve and Surplus		
3) Long-term Liabilities		
Total of 1 + 2 + 3		
II) Application of Funds		
1) Fixed Assets		
2) Less Depreciation		
3) Net Block		
4) Investments		
5) Current Assets		
6) Current Liabilities and Provisions		
7) Net Current Assets 5 – 6		
Total 3 + 4 + 5 + 6		

2.4.1 Exercise 2 : Preparation of a Balance Sheet in Account Form

We will now prepare a balance sheet in account form with the following data:

		Sch	
	Share Capital (SF)	1	
	100000 Shares issued @ Rs 10/- paid up each share		**1000000**
	Long-term Loan	2	
a)	Debentures issued for expansion (unsecured)		100000
b)	From Financial Institutions (bank)		100000
	Total of Long-term loan		**200000**
	Current liabilities and provisions	3	
a)	Provision for interest on debentures		30000
b)	Provision for interest on bank loan		30000
c)	Sundry creditors for goods and services		20000
d)	Provision for unpaid wages and rent		20000
e)	Provision for dividend		60000
f)	Provision for unclaimed dividend		20000
g)	Provision for bank overdraft		30000
	Total of current liabilities and provisions		**210000**
	Long-term Assets	4	
a)	Land, building, equipment and furniture		1500000
b)	Depreciation	5	-150000
c)	Net Block a-b above		**1350000**
d)	Investment in long-term mutual fund		75000
	Total of Long-term Assets		**1425000**
	Current Assets	7	
a)	Cash in hand		10000
b)	Cash in bank		100000
c)	Units of UTI encashable within the accounting period		50000
d)	Book debt from ABC company for health check up of its Employees		50000
e)	Advance tax paid		80000
f)	Accrued interest on investments		12500
	Total of Current Assets		**302500**

It would be seen that the item of reserve and surplus does not figure in the data. This has to be calculated from the basic equation

$$RS = TA - TL - SC$$

Where, TA = Total assets = 1425,000 + 302,500 = 1727,500

TL = Total liabilities = 200,000 + 210,000 = 410,000

SC = Share capital = 1000,000

Hence Reserve and surplus = RS = 1727,500 – 410,000 – 1000,000 = 317,500

Account Form Balance Sheet					
XYZ Hospital					
As on 31 March 2000					
	Sch*	Rs.00		Sch*	Rs.00
Equity and Liabilities			**Assets**		
1) Share Capital	1	1000	1) Fixed Assets	4	1500
2) Reserves and Surplus		317.5	2) Less Depreciation	5	150
			3) Net Block		1350
3) Long-term Liabilities	2	200	4) Investments	6	75
4) Current liabilities and Provisions	3	210	5) Current Assets	7	302.5
			6) Other Assets		0
Total Liabilities and Equity 1 + 2 + 3 + 4		1727 5	Total Assets 3 + 4 + 5 + 6		1727.5

2.4.2 Exercise 3 : Preparation of Balance Sheet in Report Form

We will now reformat the above Balance Sheet in Report Form as under:

Report Form Balance Sheet		
XYZ Hospital		
As on 31 March 2000		
	Sch*	Rs.000 (in thousands)
I) **Sources of Funds**		
1) Shareholders' Funds		
a) Share Capital	1	1000
b) Reserve and Surplus		317.5
2) Long-term Liabilities	2	200
Total of (1) and (2)		**1517.5**
II) **Application of Funds**		
1) Fixed Assets	4	1500
2) Less Depreciation	5	150
3) Net Block 1-2		1350
4) Investments	6	75
5) Current Assets	3	302.5
6) Current Liabilities and Provisions	2	210
Net Current Assets 5 – 6		92.5
Total of 3 + 4 + 5 + 6		**1517.5**

* Reference to schedule which gives details of each category of asset and liability

2.4.3 Exercise 4 : Find Defects in Given Balance Sheet

From the structure of two types of balance sheets it would be seen that the essential elements of the balance sheet are:

a) Heading: This includes the name of the firm (hospital) and type of the statement and specific date to which the statement applies.

b) Listing of all assets and liabilities properly.

c) Total assets (TA) must be equal to total liabilities (TL) + owner's equity (OE)

d) The report must be Audited and signed by the management and auditors.

Given below is a balance sheet. You are required to find defects in the same.

Assets		Rs.	Liabilities and Equity		Rs.
Fixed Assets					
Land and building		1500000	Share capital		1000000
Long-term loans			Investments		500000
a) Debentures		100000	Current liabilities		70000
Loan from bank		100000	a) Creditors		20000
Current Assets		200000	b) Bank borrowing		
a) Cash			c) TDS		
b) Debtors			d) Stock		
c) Provision for tax			e) Provision of		
			Other Assets		30000
Total Liabilities		1900000	Total assets		1600000

Hint on list of defects:

1) Type of statement has not been mentioned in heading.

2) Date: The year of report has not been mentioned.

3) Assets: Shown on left hand side.

4) Liabilities: Shown on right side

5) Depreciation: Not shown and net block not calculated.

6) Long-term loan: Shown incorrectly under Assets.

Find out rest of the defects. Assume 10% depreciation complete the balance sheet.

2.4.4 Interpretation of Balance Sheet

The three important functions served by the balance sheet are:

a) It gives a concise summary of the organisation's resources (assets) and obligations (liabilities and owner's equity), it reflects the economic results and management policies.

b) It indicates the organisation's "Liquidity" i.e. hospital's ability to pay debts as these mature. That is greater the Net Current Assets (current assets – current liabilities), better will be the liquidity.

c) It indicates the organisation's "Solvency" i.e. the hospital's ability to meet its entire short and long-term debts.

For the purpose of interpretation, we should check the following:

a) Check the difference between "Current Assets" minus "Current Liabilities" also known as "Net Current Assets". This figure should be positive and greater its value better is the financial health of the organisation.

b) Compare Total of the "Share Capital" and "Reserves and Surpluses" with "Long-term Loans". In the case of the balance sheet at 2.4.1 above, the total of "Share Capital" and Reserves and Surpluses is Rs. 1317500/- and "Long-term Loans" is Rs. 200000/-. This is good position. Supposing this figure of loans was say Rs. 2000000/- this would be a cause of concern as this figure is much more than the "Share Capital" plus "Reserve and Surpluses". This means should the loans be withdrawn the firm will not be able to even clear its debts. Thus a comparatively high figure of debt compared to its assets would need rethinking on the part of the management.

Notwithstanding the above, balance gives a summary of the organisational resources and obligation. To evaluate the performance over a year's period, the figures must be compared to the last year's figures. In fact a number of Firms publish there Balance Sheet along with figures of last year's Balance Sheet. One such balance sheet is given below.

Liabilities & Equity				Assets			
Particulars	**31 Mar 99**	**31 Mar 98**	**+/–%**	**Particulars**	**31 Mar 99**	**31 Mar 98**	**+/–%**
Capital	2000	2000	0	Fixed Assets	2200	2400	–9
				Less Depreciation	200	210	
				Net Block	2000	2190	–9.5
Reserve and Surpluses	500	400	+25	Investments (at cost)	700	570	37.25
Loan Funds	500	400	–25				
Current Liabilities and Provisions	350	300	0	Current Assets	650	500	+30
Total Liabilities and Equity	3300	3200	+4.47		3300	3200	+4.47

You can now observe the differences and make some interpretations as under which could be said to be performance highlights:

Performance Highlights

a) The total assets of the firm have increased by 4.47%.

b) The reserve and surplus has increased by 25% (good performance).

c) The current assets have increased by 30% but current liabilities have not increased. Also against the current liability of Rs. 3.5 lakhs the current assets are Rs. 6.5 lakhs (more than capable of meeting short-term debts).

d) The investments of the firm have increased by 37.25% (Growing business).

e) Against a long-term loan of Rs. 5 lakhs the shareholders' funds are Rs. 25 lakhs (Good solvency position).

2.5 BROAD CONCEPT OF PROFIT AND LOSS ACCOUNT; REVENUE AND EXPENSES

Whereas Balance Sheet indicates the firm's financial strength as measured by its resources (assets) and obligations (liabilities), the earning capacity and the potential of

the summary of revenues (income), expenses and net income or net loss of a firm for a period of time; generally accounting period of one year for the period ending the financial year. It is also known as income statement.

Revenues

These represent a gross inflow of assets or gross decrease of liabilities that result from certain profit directed activities of an enterprise that change owner's equity. These are cash received or receivable from customers (patients etc. in case of a hospital), rent of a portion of building or equipment rented out, interest on deposits in the bank, dividend on investments, sale of some fixed assets (say old equipment), sale of shares held etc.

Expenses

The cost of earning revenues is called expenditure. Expenses occur when assets are consumed or liabilities are increased to produce revenues. These represent gross decrease in assets or a gross increase in liabilities that result from profit directed activities that change owner's equity. These are cost of goods consumed, salaries, managerial remunerations, interest paid or payable on loans, depreciation, taxes and other expenses.

Net Income

The amount by which the total revenue earned during the accounting period exceeds total expenses incurred during the same period is called "Net Income". If on the other hand total expenses exceed the total revenues, then the difference is referred to as "Net Loss".

2.6 BROAD CATEGORIES OF REVENUE AND EXPENSES

In order to make and interpret a Profit and Loss Statement, it is important to understand nature of Revenues and Expenses.

The revenues are some times classified as operating revenues and non operating revenues. These are explained below:

a) **Operating revenues**: These are the revenues arising from the actual operation of a business firm. In case of a hospital these would be OPD collections, fees for surgery, fees for clinical tests and other hospital charges to be paid by the patients.

b) **Non-operating revenues**: These are revenues which are incidental to the main operations of the business; examples : interest from temporary investments, sale of old equipment etc.

Like revenues, expenses are sometimes classified as operating expenses. These are given below:

a) **Operating expenses**: These are the expenses relating to the main operations of the business firm; examples : cost of stores consumed, general and administrative expenses, depreciation etc.

b) **Non-operating expenses**: These are the expenses incurred in generating the non-operating revenues.

It is also important to know about the following terms in connection with profit and loss account:

a) **Gross Profit (GP)**: This is the difference between the sales and cost of goods and services provided.

b) **Operating Profit (OP)**: This is the difference between the gross profit and the operating expenses (OExp) consisting of general and administrative and selling expenses and depreciation (DEP).

OP = GP – OExp – DEP . The operating profit is also known as Profit before interest and Tax (PBIT), which is a measure of performance of firms operations.

d) **Net Profit (NP)**: This is the profit after paying the taxes. NP = PBT – Tax.

The Account Form of Profit And Loss State has two sides i.e. the left-hand side showing Expenses and right hand side showing Revenues. The standard format is as shown below:

Account Form Profit and Loss Account	
XYZ Hospital	
As on 31 March 2000	
Expenses	**Revenues**
Cost of goods and services provided	Sales of goods and services
General and administrative expenses	Other Income
Interest on loans	
Depreciation	
Non-operating expenses	
Net Profit	
equal	equal
Appropriation	
Provision for dividend *	
Reserve and surplus	

* Dividends are paid if the hospital is a corporate entity and owners are entitled to share of profits and dividend.

2.6.1 Exercise 5 : To Distinguish and Categorize Revenue and Expenses

Based on what you have read in section 2.6, you should now be able to distinguish between Revenues and Expenses. In the table given below indicate whether these are classified as operating or non-operating. A few columns have been filled. You may fill the remaining.

Description	Revenue	Expenses	Operating	Non Operating
1) Receipts from radiology	yes		yes	
2) Interest received	yes			yes
3) Interest paid on loan		yes	yes	
4) Cost of medicines		yes	yes	
5) Depreciation		yes	yes	
6) Rent received for rented out portion	yes			yes
7) Rent paid				
8) Provision of tax		yes	yes	
9) Cost of old furniture				
10) Accrued dividend	yes			
11) Commission				
12) Overdraft from the bank				

13) Advance payment for supply of stores written off as bad debt.				
14) Sale price of old equipment sold				
15) Salary, wages				
16) Maintenance for rented out portion				
17 Maintenance cost for other portion				

2.7 TYPES OF PROFIT AND LOSS ACCOUNT

The Profit and Loss account can be presented in several forms. Two popular forms are: the Account Form and Report Form.

It would be seen that column "Net Profit" is to be calculated from "Revenues" – "Expenses" so that both sides become equal. The Net Profit is then reappropriated to provision of dividend and reserve and surpluses.

The report form of profit and loss account statement is further subdivided into "Single Step Profit and Loss account" and "Multi Step Profit and Loss account". In these non-operating expenses are shown separately. In case of Multi Step form more useful information is displayed. The structure of both these formats is given below:

Single Step Report Form of Profit and Loss Account		
XYZ Hospital		
As on 31 March 2000		
	Rs.000	Rs.000
Revenues		
1) Sales of goods and services		
2) Other income		
Total		
Expenses		
Cost goods and services provided		
General and administrative expenses		
Interest on loans		
Depreciation		
Non-operating expenses		
Provision for Tax		
Total		
Net Profit (after tax)		
Appropriation*		
Provision for dividend		
Reserve and surplus		

Multi Step Report Form of Profit and Loss Account	
XYZ Hospital	
As on 31 March 2000	
1)	Sales
2)	Less: Cost of goods and services sold
	Gross Profit (GP)
	Less : Operating expenses (OExp)
1)	General and administrative expenses
2)	Depreciation (DEP)
	Operative Profit (OP = GP – OExp – DEP)
1)	Less: interest
2)	Plus: other income
3)	Less: Non-operating expenses
	Profit Before Tax
1)	Less: Provision of tax
	Net Profit = PBT – Tax
	Appropriation*
	Provision for dividend
	Reserve and surplus

2.7.1 Exercise 6 : Preparation of a Profit and Loss Statement in Account Form

We will now prepare a profit and loss statement with following data:

Expenses	Rs.000
Operating Expenses	
Cost of medicines and other stores used	1100
General and administrative expenses	120
Interest on loans	40
Depreciation	110
Provision for unclaimed dividend	10
Provisions for taxes	120
Electric, water supply and insurance	50
Auditor's remuneration	20
	1570
Non-operating Expenses	
Book value of the old machinery sold	50
Advertisement charges (for sale)	2
Maintenance charges for room given on rent	10
Revenues	**62**

Operating Revenues	
Services rendered	1500
Sale from pharmacy	200
	1700
Non-operating Revenues	
Dividend from investments made	40
Sale price of old equipment sold	100
Rent received	50
Other Income	10
	200

The profit and loss account in account form is given below:

Accvount Form Profit and Loss Account			
XYZ Hospital			
As on 31 March 1999			
Expenses		**Revenues**	
Operating Expenses		**Operating Revenues**	
Cost of medicines and other stores used	1100	Services rendered	1500
General and administrative expenses	120	Sale from pharmacy	200
Interest on loans	40	**Non-operating Revenues**	
Depreciation	110	Dividend from investments made	40
Provision for unclaimed dividend	10	Sale price of old equipment sold	100
Provisions for taxes	120	Rent received	50
Electric, water supply and insurance	50	Other Income	10
Auditor's remuneration	20		
Non-operating Expenses	0		
Book value of the old machinery sold	50		
Advertisement charges (for sale)	2		
Maintenance charges for room given on rent	10		
Net profit	268		
	1900		**1900**
Appropriations			
Provision for dividend	**160**	Net Profit	**268**
Reserve and surplus	**108**		
	268		**268**

It would be seen that the element of Net Profit was not been given in the data and has been arrived at by subtracting total Expenses from total Revenues so as to make both sides equal. Now we make this report in single step report in exercise 7 given below.

2.7.2 Exercise 7 : Preparation of a Profit and Loss Statement in Single Step Form

The profit and loss account in single step report form is given below:

Single Step Report Form of Profit and Loss Account				
XYZ Hospital				
As on 31 March 1999				
			Rs.000	Rs.000
1)	**Revenues**			
	Operating revenues			
	Services rendered		1500	
	Sale from pharmacy		200	
	Non-operating revenues			
	Book value of the old machinery sold	50		
	Advertisement charges (for sale)	2		
	,Maintenance charges for room given on rent	10		
	Revenues	**62**		
			1900	1900
2)	**Expenses**			
	Operating expenses			
	Cost of medicines and other stores used		1100	
	General and administrative expenses		120	
	Interest on loans		40	
	Depreciation		110	
	Provision for unclaimed dividend		10	
	Provisions for taxes		120	
	Electric, water supply and insurance		50	
	Auditors remuneration		20	
	Non-operating expenses		0	
	Book value of the old machinery sold		50	
	Advertisement charges (for sale)		2	
	Maintenance charges for room given on rent		10	1632
	Net Profit (after Tax) 1-2			268
	Appropriations			
	Provision for dividend			160
	Reserve and surplus			108

It would be seen that we have rewritten the data in continuous form and Net profit has been arrived at by straight subtraction unlike the account form where we had to balance both sides. Now we will make a more detailed form of statement in multi step form as given below in the next exercise.

2.7.3 Exercise 8 : Preparation of a Profit and Loss Statement in Multiple Step Form

The profit and loss account in multi step report form is given below:

Multi Form Report Form of Profit and Loss Account				
XYZ Hospital As on 31 March 1999				
		Rs.000	Rs.000	Rs.000
1)	**Sales of goods and services**			
	a) Services rendered	1500		
	b) Sales from pharmacy	200	1700	
2)	Less : Cost of medicines and other stores used	1100	1100	
3)	**Gross Profit (GP) 1–2**			**600**
	Less : operating expenses (OExp)			
	a) General and administrative expenses	120		
	b) Depreciation (DEP)	110		
	c) electric/water supply and insurance	50		
	d) Auditor's remuneration	20		
		–310		**–310**
4)	**Operative profit (OP = GP – Oexp – DEP)**			**290**
	Less: Interest	–40		250
	Plus other incomes			
	Dividend from investments	40		
	Sale price of old equipment sold	100		
	Rent received	50		
	Other Income	10		
		200		
	Less : Non-operating expenses			
	Book value of the old machinery sold 50			
	Advertisement charges (for sale) 2			
	Maintenance charges for room given on rent 10			
	Total of 4	– 62	**138**	**138**
5)	**Net Profit = PBT – Tax**			**388**
	Less: Provision of tax		120	120
6)	**Net profit after Tax**			**268**
	Appropriation*			
	Provision for Dividend			**108**
	Reserve and Surplus			**200**

2.7.4 Exercise 9 : To Find Defects in a Profit and Loss Statement

From the structure of three types of profit and loss statement it would be seen that the essential elements of the profit and loss statement are:

a) Heading: This includes the name of the firm (hospital) and type of the statement and specific date to which the statement applies.

b) Listing of all revenues and expenses properly.

c) Net Profit =Total Revenues – Total Expenses

d) The report must be Audited and signed by the management and auditors. Given below is a balance sheet. You are required to find defects in the same.

Balance Sheet		
XYZ Hospital		
As on 31 March 2000		
	Rs.000	Rs.000
Expenses		
Operating Expenses		
Cost of medicines and other stores used	1100	
General and administrative expenses	120	
Rent received	40	
Interest on loans	40	
Maintenance charges for room given on rent	10	
Provisions for taxes	120	
Advertisement charges (for sale)	2	
Non-operating Expenses		
Book value of the old machinery sold	50	
Provision for unclaimed dividend	10	
Electric water supply and insurance	50	
Auditor's remuneration	20	**1632**
Operating Revenues		
Services rendered	1500	
Sale from pharmacy	200	
Dividend from investment	40	
Non-operating Revenues		
Sale price of old equipment sold	100	
Provision for rent	50	
Other Income	10	
	1900	1900
Net Profit (after Tax) 1 – 2	268	**268**
Appropriations	200	
Provision for dividend	160	
Reserve and surplus	108	

Hint on list of defects:

1) Type of statement has not been mentioned in heading.

2) Date: The year of report has not been mentioned.

3) Expenses: Shown at top

4) Revenues: Shown after expenses

5) Depreciation: Not shown accounted for in operating expenses.

6) Dividend from investment shown as Operating Revenue instead of Non-operating revenue.

Find out rest of the defects. Assume depreciation as 110 and complete the profit and loss account.

2.7.5 Exercise 10 : Interpretation of Profit and Loss Statement

The three important functions served by the profit and loss account statement are:

a) It gives a concise summary of the firm's resources revenues and expenses during a period of time and reflects the economic results and management policies.

b) It indicates the firm's "profitability", i.e. profits on investments. That is greater the Net profit, better it is.

c) It communicates information regarding the firms activities to owners and others including for calculation of income tax.

For the purpose of interpretation, we should check the following:

a) Check the difference between "Operating revenue" minus "Operating expense" which is also known as "Operating Profit". This figure should be positive and greater its value better is the financial health of the organisation. It indicates that the firm is making good profit from its main business. This figure can be increased either by cutting down expenses or increase revenue or both.

b) Check the amount of Net Profit and examine if it is sufficient as compared to the total expenses.

c) Check whether there is adequate reserve and surpluses generated i.e. whether the firm has been able to add to the reserve and surpluses after payment of dividends so as to reinvest for expansion of the business.

Notwithstanding the above, the profit and loss gives a summary of the organisation's revenues and expenses and profit. To evaluate the performance over a year's period, the figures must be compared to the last year's figures. In fact a number of firms publish their Profit and Loss statement along with figures of last year's statement.

		31 Mar 2000	31 Mar 1999	% +/–
1)	**Sales of goods and services**	**1700**	**1400**	**+21.42%**
2)	**Less:** Cost of medicines and other stores used	–1100	–1000	+10%
3)	Gross profit (GP) 1–2	**600**	**400**	**+50%**
	Less : Operating expenses (OExp and DEP)			
		–310	**–285**	**+8%**
4)	**Operative profit (OP = GP – OExp – DEP)**	**290**	115	**+152%**
	Less: Interest	–40	–40	Nil
	Plus other income	200	150	30%
	Less : Non-operating expenses	–62	–50	24%

5)	Net Profit before Tax	**388**	**175**	**+41%**
6)	Tax	120	53	
7)	Net Profit after Tax	268	122	119%
	Appropriations			
	Provision of dividend	160	80	+60
	Reserve and surplus	108	42	157%

You can now observe the differences and make some interpretations as under which could be said to be performance highlights:

a) Gross profit increased by 50%.

b) Operative profit increased 152%, which indicates that the firm has done well in its business of operations by good policies and operation.

c) The firm has given 60% more in dividend.

d) The firm has been able to increase the reserve and surplus by 157 % thus giving more investment power to the firm.

2.8 LET US SUM UP

The Financial Statements – Balance Sheet and Profit and Loss account – are the basic instruments of financial accounting system and are required to communicate financial information to owners, creditors, managers, employees, customers, suppliers, Government and society.

Balance sheet shows the financial status or state of affairs of an organisation at a particular point of time and contains information about the hospital's assets, liabilities and owner's equity. Although it can be made at any point of time but it is usually made for the end of the financial year and is required both for the purpose of income tax and for the information of the shareholders.

The profit and loss account is actually income statement and shows the profitability of the firm by giving details about Revenues, Expenses and Income (or Loss). The cost of economic resources used in providing goods or services to the customers is called expense. Revenues are the benefits that the customers contribute to the organisation in exchange for goods and services provided by it. Profit is the difference between revenue and expenses. This can also be prepared for any period of time although it is made annually for the financial year ending. This statement is required to be submitted to income tax authority in support of the calculation and justification of tax liability. Both these statements are financial statement of utmost importance have to be made carefully and must contain all material accounting information with complete and fair disclosure both unfavourable or potentially unfavourable. A study of these could give insight to the working of the firm and the corrective actions required as a manager.

UNIT 3 MANUAL : UTILISATION OF EQUIPMENT

Structure

3.0 OBJECTIVES

After going through this unit you should be able to:

- make plan for selection and procure right type of equipment;
- ensure optimum utilization of equipment;
- evolve proper mechanism for timely preventive and breakdown maintenance; and
- forecast and cater for essential spares for imported and indigenous equipment.

3.1 INTRODUCTION

In this unit you will learn about analyzing a given problem systematically and steps in solving a problem being faced by a Hospital.

You may be aware that so many costly medical equipments are lying in the hospitals which are either never installed in time or are out of order for want of spares or proper maintenance. These type of happenings are very common and most of the big government hospitals are plagued with this problem, which not only gives bad publicity to the Hospital Administration but also leads to wastage of scarcely available resources of the country. Proper planning of medical equipment in a hospital will not only economise on resources but will also result in availability of maximum equipment in functional state all the time.

In this study we will systematically try to analyse the problem of equipment management in a hospital and also devise means to minimise such problems.

3.2 REVIEW OF SITUATION

Here is a case of 600 bedded teaching hospital, where medical superintendent wanted to hold an annual meeting of the heads of all departments to discuss the requirements of medical equipment for modernisation of the departmental facilities. Medical superintendent is an experienced administrator and before taking decision he asked all the departments to submit a list of equipment already held by them with their status on serviceability and utilisation. During course of further discussion following facts came to light:

a) Some of the equipment though procured more than one year ago but have not been installed as yet.

b) Some of the equipment was underutilised.

c) Some of the equipment were reparable.

d) Some of the equipment though serviceable but were outdated, as new models were available in the market.

(**Note** : The Medical superintendent is an experienced administrator and he decided to consider the proposal for modernisation after thorough scrutiny of factual position of the equipment already held by the departments. He, therefore, convened a board of officers to survey the costly equipment held by each department and to recommend plans for procurement, installation, maintenance and repair).

3.2.1 Biomedical Equipment

Biomedical equipment: Biomedical equipment are those equipment which are required for diagnostic, therapeutic and monitoring purposes for patient care and for research purposes. Though these may also include house keeping equipment such as testing, data processing and record keeping devices which may have direct patient connection, but may warrant special consideration. Our study will comprise only to first group of equipment.

3.2.2 National and International Regulatory Mechanism for Manufacturers

In America in 1976, the Food, Drug and Cosmetic Act were amended to establish the Food and Drug Administration's Bureau of Medical Devices to regulate medical device manufactures. During this period only, many new professional and institutional standards were generated by groups such as the Joint Commissioner on Accreditation of Health Care Organisations (JCAHO), the National Fire Protection Association (NFPA), Association for the Advancement of Medical Instrumentation (AA MI) to govern hospitals' arrangement and use of equipment.

With the advent of modern technology the dependence on medical equipment is increasing every day and equipment are becoming complex and costlier. It all has resulted in more and more investment on equipment in the health care industry. Before 1970 biomedical equipment was relatively simpler and could be bought, used and maintained with minor on the job training. Between 1970 and 80, sales of medical equipment tripled, its complexity increased and more and more patient safety features were incorporated. In America the Medical device industry of 1970s grew from $ 3 billion to $ 12 billion in total shipments in 1980. In India the health care industry is estimated to be 70,000 crore

rupees (Business India 15 July and 03 August issue). The role of Hospital Administrators in India is more difficult as there are no separate statutory devices available to regulate the production, import, sales or quality of the medical equipment used in the country. We will subsequently know the adverse impact of these serious legislative lacunae in details.

3.3 FACTORS RESPONSIBLE

Every organisation has different purchase procedures, rules and regulations for procurement and maintenance of equipment. Even the person involved in procurement does effect the type and quality of equipment purchased hence to have a fair idea about the real equipment state, it is necessary to see the equipment on ground, to see the documents relating to procurement and the procedure being followed to maintain and repair them. A few explanations are as follows:

3.3.1 Overenthusiastic Projection

Some equipment are procured, but are never used as the existing equipment is running satisfactorily and workload has not increased as anticipated. The anticipated future workload was not estimated scientifically, and requirement was projected for on an empirical basis for procurement.

3.3.2 Improper Coordination of Physical Facility

In some cases equipment have been imported and delivered but the building in which it was to be installed is not ready and by the time building is ready the equipment does not remain use worthy as some parts get rusted, some are stolen and some part go defective due to non use. Firm also does not take responsibility because warranty period is over and no provision was kept in supply order for such contingencies.

In a few cases equipment is delivered in Central Medical Depot from where it is intended to be distributed to some of the hospitals, but by the time it reaches there and installed warranty period is over and firm does not accept responsibility. This type of situation is encountered in larger organisations like Defence, Railways, and ESI where Central procurement is made for number of distant hospitals.

3.3.3 Complicated Procedures

In some cases firm gives sub-standard equipment and claim major part of the cost 90 % or so and leaves the hospital in lunch by not installing it. In such cases firm is willing to forgo the balance of payment as the equipment it supplied was of much lesser value than the cost quoted. Though it happens with the connivance of the purchase/user agency, the firm knows that organisation may not resort to legal action as legal procedures are very complicated and management wants to avoid it.

3.3.4 Fly by Night Suppliers

There are cases where firm does not supply adequate spares and does not have repair/ servicing facility and after a year or so of supply they even change the agencies leaving the hospital high and dry. Hospital purchase authority did not have much control because the firm happened to be the lowest bidder.

3.3.5 Improper Coordination with Infrastructure

Electricity requirement should be well planned, it is invariably seen that equipment has been installed but requisite voltage/power supply is not available. Modern electronic machines are very sensitive to surge and fluctuations in electricity and slight aberration may make the machine non-functional. In some cases machines have been reported to have gone out of order just because earthing was not done properly and firm delivered the responsibility as it was not the part of contract.

Laundry and CSSD plant require adequate amount of water of required quality and if water is hard the Ca&Mg salts get deposited at higher temperature and supply pipe line is

blocked because of chemical deposition. Even the heater coils in a boiler are required to be changed frequently because of salt deposition on them. Thus water treatment plant like ionization filter or reverse osmosis plant is a very important requirement. For facilities using radioactive material like nuclear medicine, there is a requirement of obtaining NOC/License from BARC or such agencies. It has been reported that though facility for such intervention are ready but due to non initiation of license process in time it cannot be used for months.

3.3.6 Selection of Inappropriate Technology

Machines do get defective for various reasons but in the absence of preventive maintenance the down time keeps increasing (down time is the period for which machine remains idle for want of repair). It is not infrequent to see that machines are technologically so advanced and sophisticated that specialist concern will insist for its procurement but when it goes defective, facility is not available there to repair it. Thus selection of appropriate technology is of paramount importance. It is also true that the technicians and their technology level do not support the level of sophistication of the machine. Since recruitment of highly qualified technical staff may not be possible especially in Government set-up, hence machine selected should be user friendly.

3.3.7 Environment Bye-laws

Provision for prevention of environment pollution, with use of Radioactive Material, x-ray installation and the procedures liberating pollutants and infected by-products should be taken care of otherwise the pollution control board authorities may ask for shut down of such facilities and machines are bound to remain unutilized till it satisfies the local bye-laws for environment

3.3.8 Spares and Consumables

More often then not machines remain out of use for want of spares or consumables especially when procuring agencies are different for equipment and consumables. There are more chances of such mismatch for instance in case of Biochemistry or Blood Gas analyses, the consumable kits are machine specific (close end system) and cannot be used with other analysers.

3.3.9 Modification and Upgradation Aspects

Conventional conditions like temperature and humidity also affect the working of a machine, since most of the equipment were imported from Western Countries where temperatures remains subzero to 20°C or so, whereas in India it shoots upto 45°C. Though air conditions are used but only during working hours and it does happen that due to heat the lubricant melts away or the calibration may go haywire. Upgradation of software is an important part as no firm takes responsibility of obsolete software if not mentioned in the contract.

3.4 MATERIALS AND METHOD

The whole process of evaluation and equipment audit has to be in a comprehensive and holistic approach covering aspects like equipment planning, including the electrical, mechanical installations, acquisition process, storage, equipment installation, utilisation, maintenance programme, spares and accessories, cost-effectiveness, safety measures, training of personel, etc. Approach to evaluation should be sequential process as follows:

3.4.1 Visit to Central Equipment Store and other Important Cost Centres

Visit to these areas will give first hand information on various aspects and help to evaluate the bottlenecks in the system. The evaluation process of functioning of equipment may be done on following parameters:

Evaluation of process and functioning of equipment:

a) Direct observation of equipment's operation and functioning

b) Spot evaluation : Making a visit to a particular department can do this, say for example OT. If it is found that only a few are working and others are non-functional or not installed. The following questions can then be asked:

1) Since when are the equipment non-functional?

2) What was the reason for equipment break-down?

3) Were the equipment within warranty period?

4) Has any repair work been carried out so far?

5) Why one equipment is not yet installed? Is it due to inadequate structural design, mechanical and electrical requirements or due to some equipment accessories?

6) What are the preventive maintenance and running maintenance schedule being carried out for two equipment which are working?

3.4.2 Questionnaire Study

A check-list is given at Appendix 'A' to include all the aspects on which a machine or facility should be checked. This feedback will give valuable information about the reasons as to why the equipment have gone out of order and what precautions are to be taken at every level while installing a machine in any department.

3.4.3 Study of Documents

A convenient check list can be followed as follows:

i) List of equipment on inventory and tallying it on grounds for make, date of manufacture, model and number.

ii) History/Log book: Logbook gives complete history of the equipment, about downtime uptime, time log between two breakdowns, type of defect which occurs frequently, type of spare required more often, its maintainability, the efficiency of the firm undertaking repairs etc.

iii) Equipment maintenance manual whether supplier with the equipment or not, is it in the common language like English or Hindi of local language. Does it also give circuit diagram?

iv) Codified list of spares along with cost and place of availability.

v) Local vendor/Service centre list

vi) Copy of supply order: It gives complete details of terms and conditions warranty period, rate of annual maintenance contract, frequency of preventive maintenance and its scope. Another important aspect included in so is the security deposit and Bank guarantee and other payment related terms.

vii) Policies and procedure Register

It is always useful to make policy for initial inspection, checking of document and keeping record of the accessories and consumables required. It can be in the form of standing operative procedures (SCP). It will help the new staff and young specialist as a ready recorder.

3.4.4 Analysis of Critical Incident Reporting

This will bring out the aspects like how is the defective functioning of an equipme reported, what corrective actions are taken and within what interval

3.4.5 Calculations of a Few Indices

a) Use Coefficient $= \frac{\text{Average number of hours eqpt used a day}}{\text{Maximum No. of hours it can be used}} \times 100$

b) Down Time Index $= \frac{\text{Down time hours}}{\text{Service hours}} \times 100$

c) Breakdown Maintenance Index $= \frac{\text{No. of hours spent on breakdown}}{\text{Total man-hours available}} \times 100$

d) Maintenance Cost Index $= \frac{\text{Maintenance cost}}{\text{Capital cost}} \times 100$

3.4.6 Analysis of the Observation Data and Preparation of Report

After going through the above procedures one can have a fair idea about the actual problem stage whether it was:

a) at the selection stage of the equipment

b) due to faulty purchase procedure

c) due to wrong selection of vendor

d) due to shortcoming in tender document or supply order

e) due to incompetent supplier

f) due to improper planning in terms of

- Physical facilities
- Electricity
- Any other intrinsic factor

g) Non existent or faulty maintenance policy

After pinning down the defect the management can always take remedial measure and also take necessary step so that the mistake is not repeated in future.

Discussion

After analysing the equipment state, it is not difficult to find out the reasons as to why equipment remain out of order. More often than not the reason lies with inadequate policies and faulty procedures. Greedy and unscrupulous suppliers with the convenience of gullible officials and users take advantage of loopholes in the procedures. They even interpret the rules in their favour. In public sector undertakings there are so many agencies involved that it is difficult to pinpoint the responsibility for the lapses. More the number of agencies involved in procurement more are the chances of exploiting the loopholes by master interpreting the rules and more difficult it becomes to take remedial action or fire the person responsible.

3.5 RECOMMENDATIONS

Following guidelines are recommended to help in procuring a right type of equipment, at right cost in right time and of right quality.

3.5.1 Need Assessment

A user specialist should ask following questions before projecting a requirement:

a) Is the new equipment really required in terms of case load? How many patients are likely to use it now and as per trend analysis how many patient are likely to use after 6 months, 1 year and 2 years? If equipment is likely to be used to its optimum capacity within 6 months or less it should be procured immediately, if after 6 months to 1 year but procurement process will take more than 6 months, still case should be

initiated now. But if optimum case load is likely to be after 1 year or more it will be wise to wait for 6 months to .

i) confirm the expected trend, and

ii) assessment of alternative models.

b) If the existing equipment has outlived its utility and there is no alternative then it becomes overriding priority to buy a new equipment now.

c) After introduction of new technology does old technology becomes totally irrelevant? This question is very pertinent specially in developing countries where resources are scare, the temptation of buying a new equipment with a few more advanced features should be resisted if the existing equipment is serving the purpose adequately. The wait will be worth as by that time there may be a more sophisticated and relevant equipment may be introduced and also will give time to assess the equipment from other sources. The opportunity cost saved due to such decision can be utilised gainfully elsewhere.

d) Are you familiar with the equipment? It is always advisable to ensure that the equipment being procured has been analysed on following aspects:

i) Have you worked on it and are concerned about the utility?

ii) Any neighbouring institute has use it with satisfaction

iii) The source of information advocating its used is reliable and is not concerned with the supplier/firm.

e) It will be an excellent idea if out of 3 or 4 discarded equipment one can be canalized to take useful spares and put it in other equipment and put it on road.

f) Type of equipment : The technological advancement and its assimilations in medical equipment is so fast that within 1 to 2 years the existing equipment starts appearing obsolete. Though every new equipment manufacturer will claim a few advanced features but there may not be necessarily required.

After assessing the requirement it should also be ensured that the equipment will conform to local requirement like environment laws, emission norms, pressure (boiler) regulations etc. It should also be ensured that building and other infrastructure like water, electricity, ventilation etc. would also be ready before the equipment is likely to be procured.

After satisfying on above aspects the requirement should be forwarded to the management. The case for projection should include:

a) Justification of the requirement

b) Technical specifications, any brand name or manufacturer's name should be avoided rather qualitative requirements should be given.

c) Appropriate cost

d) Names of known supplier with address

e) If it is proposed to procure imported equipment then advantage of imported equipment over the indigenous one should be mentioned.

f) Annual servicing and maintenance cost for a period of 5 to 10 years should also be reflected with the demand note.

3.5.2 Role of Management

Medical superintendent or management after receiving the requirement from various departments should prioritise the requirement and if required a committee should be formed for this which can have members from major specialities. Committee should have a meeting where all the specialists and super specialist will justify their projected requirements. The Committee based on available funds will allocate Prioritised Procurement Plan. It is always advisable to prepare the Prioritised Procurement Plans before beginning of financial year in Public Sector Hospitals. The plan may be given to

Composition of CEPC

Medical Superintendent	Chairman
Specialist officer of concerned speciality	Member*
One Senior Medical Officer	Member
Accounts Officer	Member

* Specialist officer who has prepared the Technical Specifications (Qualitative Requirements) should be co-opted member in attendance for on the spot technical guidance.

3.5.3 Functions of CEPC

i) CEPC will take procurement action for item in Priorities Procurement Plan.

ii) While selecting equipment for procurement, upgradibility, maintenance requirement, cost and availability will be taken into consideration.

iii) It will undertake tender action, technical evaluations and procurement action for all equipment.

iv) In bigger establishments two separate sub-committees can be detailed for technical evaluation and opening of price bid.

v) Technical evaluation committee will give its recommendations for those manufacturers whose bid confirm to the acceptable technical parameters. Preferably minimum three firms should be selected.

vi) Price bid will be opened only for those firm whose product are recommended by the technical evaluation committee.

vii) Price Negotiation*

* (CEPC will carry out price negotiation with the representatives of short-listed firm as recommended by Technical Evaluation Committee. As per Central Vigilance Committee (CRV) guidedlines, price negotiations can only be done with the lowest quotee).

viii) CEPC can also recommend to dispense with the above procedure if item is manufactured by single firm (Proprietary Article) or for any convincing reason item of only particular firm is required.

ix) After price negotiation supply order may be placed on the firm.

x) Earnest money/security money may be deposited from the supplier as per rules. It may be in the form of bank guarantee also.

xi) A clause may be included in the supply order that balance 10 – 25 % of the cost of equipment be paid only after completion of three months period, from the date of installation and final inspection from the user specialist.

xii) Performance bond : Performance bond should be signed by the firm on which supply order has been placed incorporating clause that in case of failure of rectification of error, failure to provide spares, failure to conduct training to staff will render the contract invalid and no payment will be made to the firm and the balance of the cost of equipment/earnest/security money will be forfeited.

xiii) Date of delivery should be within 6 weeks of the date of supply order. Extension of date of delivery may be done only in genuine cases by the CEPC with penalty. Supply order will be cancelled after a period of 6 months from the date of placement of order.

A) As it is difficult to judge the correctness of the price of equipment quoted, the following aspects will be taken into considerations:

a) Imported or indigenous item

b) Distances involved between source and destinations

c) Mode of carriage of the machine

d) Additional cost of installation

e) Application of sales tax

f) Quantitative discount

g) Amount of earnest/security or final payment of balance of cost of equipment.

h) Custom duty, freight charges and insurance.

j) Component of foreign exchange

B) The members of CEPC should preferably carry out independent inquiry about the approximate cost of the equipment.

C) As far as possible supply order by other Hospital may be obtained for comparison of prices.

D) CEPC may consider distributing supply order amongst two lowest quotees for purpose of competition in service/repair and maintenance facility.

Progressing of supplies: CEPC should progress the supply of item and if prospects of supply from a particular firm are bleak, appropriate action should be taken to cancel the order and fresh rate inquiries should be issued limited to only those firms who qualify for quick supply as per technical specifications.

Receipt of Certified Receipt Vouchers (CRV), Satisfactory performance and Final Inspection Certificate:

i) CRVs will be forwarded by the user department after installation of equipment by the firm, that the item is taken on ledger charge, signed by user specialist/inspecting authorities and Store Officer.

ii) Satisfactory Performance Certificate certifying that equipment is working satisfactorily signed by specialist concerned, countersigned by HOD will be prepared alongwith CRV after installation of the equipment.

iii) Final Inspection Certificate: Final inspection will be carried out after three months from the date of installation of equipment.

Clearance of Bill

i) All payment will be made to the firm on receiving intimation about CRV/ Satisfactory Performance. Final Inspection Certificate and payment is approved by CEPC.

ii) 75-90% of the cost of equipment (as per supply order) will be paid to the firm on receipt of CRV and satisfactory performance and balance of 10-25% after final inspection report.

Guarantee/Warranty: The stores supplied against the supply order will be dimmed to have warranty of the firm against defective material, workmanship and performance for a period of 3 years from the date of satisfactory installation at the consignee end. If during this period/the stores/spares supplied are found by the consignee to be defective, the same will be replaced immediately with the serviceable stores by the firm free of cost/charges at site within 30 days otherwise firm will accept suitable penalty as may be decided by the purchaser.

Maintenance/Repair

a) Supply order will also include the undertaking by the firm about maintenance and repair after completion of Guarantee/Warranty period. The Annual Maintenance rate per year should also be mentioned. It may be upto 2% of the cost of equipment per first year after conclusion of warranty period.

b) A clause will be incorporated in the supply order that the spare parts and components will be made available by the firm concerned during next 10 years after installation, in case of non-fulfillment of the clause firm will accept the penalty as decided by the purchaser. The cost of spare and code numbers of the spares will be supplied by the firm along with the equipment.

c) Firm will also supply the chart diagram and maintenance schedule of the equipment.

3.6 LET US SUM UP

With the advent of the new technology more and more diagnostic and therapeutic procedures are becoming equipment oriented. Since equipment increase cost of treatment it is of paramount importance that these are utilised properly. If you can follow the guidelines, we have discussed above, you should be able to project right type of equipment and procure at correct cost, at right time with right terms and conditions.

3.7 REQUIREMENT

You are required to visit a local hospital (200 beds or above) and carry out a study of equipment management system, as per questionnaire attached in Appendix A.

QUESTIONNAIRE

1) How was the need analysis carried out at the time of acquiring the equipment?

   a) Was the equipment required for the hospital after taking into consideration factors like expected workload?

   b) What was the basis of deciding the requirement of the equipment?

      - Cases requiring investigations were sent to other hospital.
      - Facility not available in Town.

   c) Was it considered on a Scientific basis through instituting a committee of more than one user speciality?

   d) Was it decided to go in for latest technology based on subjective consideration or the user specialist had some experience of working on the machine in India or abroad?

2) How was the vendor/supplier selected?

   a) Was it an open tender or limited tender?

   b) Was it a two-bid system i.e. technical and price bid?

   c) What is the credibility of the firm? Was it analysed properly? Where all have the firm installed the equipment earlier than this and what is the report?

3) Is the technology up-gradable?

4) Has a specification audit been carried out meticulously including trial runs at both manufacturers end and hospital location after installing the equipment?

5) When did the warranty period start and how long will it last?

   Ideally the hospital should negotiate for starting of warranty period after 1 month of installation of the equipment and its functioning.

6) Is there an equipment inventory available in the hospital, which includes all details related to technical classification, e.g. electrical, mechanical, electronic, etc.?

7) Are descriptions like make, model, and identification numbers, date of purchase, original cost, date of entering into service contract properly maintained?

8) Is there any penalty clause in case the OEM fails to provide maintenance/repair service within a stipulated time-frame after the equipment suffers breakdown?

9) Whether adequate expertise, spare parts for repairs are available? Is there any specific agency earmarked for repair and maintenance of a particular equipment?

10) What is the level of physical supplies, staff, engineering support system, and expertise required for each item? Is it available with the hospital?

11) What are the measures/support going to be offered or being offered by the OEM, such as,

   a) Is the equipment going to be replaced by another one during the time of repair?

   b) Warranty services and its compliance level.

   c) Provision at spares/accessories/consumables.

   d) Training for the concerned staff : It should be carried out in English or in a language which would be easily understood.

   e) Whether the training package for the staff abroad or within India include their lodging and food apart from training aspect.

12) Is there a continuing training programme running from all concerned technicians?

13) Is there a standby power supply facility with the hospital? What is its reliability and sustenance?

14) In case of an equipment failure, what is the alternative course of action with the hospital, so that there is no deficiency in service?

15) What is the performance level and utilisation of the equipment?

16) How is the critical incident reporting system?

17) How is the overall satisfaction level, i.e., satisfaction of clientele and that of hospital authority?

18) Is there a set of clearly laid down policies and procedures?

UNIT 4 MANUAL : INVENTORY ANALYSIS

Structure

4.0 OBJECTIVES

After reading this unit, you should be able to:

- understand the principles of Inventory Analysis;
- apply the methodology of Inventory Analysis; and
- do the analysis for Inventory Control.

4.1 INTRODUCTION

You have already learnt in Block 3 Unit 2 of Course 3 about the concepts, functions and application of Inventory Control for effective and efficient materials management particularly for the consumable including drug items. Also you have learnt why to classify the consumable items scientifically so that we can have a better control over these items and ensure the availability of these items whenever and wherever required.

In this unit, you will learn the principles of Inventory Analysis. You will also learn the detail methodology of Inventory Analysis including various steps involved in analysis for classifying the consumable items in the various groups so that you can have a better control over the consumption pattern of these items. This analysis will help you in better and more effective and efficient store management particularly for the consumable items and you can ensure the availability of these items whenever and wherever required.

4.2 PRINCIPLES OF INVENTORY ANALYSIS

The term Inventory refers to the stock at hand at a given time [a tangible asset, which can be seen, weighed or counted]. It refers to the material held in an idle or incomplete state, awaiting future sale or use. Broadly, inventory is an idle resource.

Inventory control is an activity with the objective of minimizing the total cost of maintaining inventories and of acquiring them in order to render the stipulated level of service.

Inventory control means stocking adequate number and kinds of stores so that the materials are available whenever required and wherever required. High inventory level leads to high cost through:

a) Locking up of finance

b) Large storage space

c) Large handling and administration charges

d) Obsolescence and spoilage.

On the contrary, low inventories may lead to frequent stock outs and high shortage cost. Balancing the cost of carrying high inventories and cost of shortage is done through a system of scientific inventory control.

For the better management of inventory one must classify the inventory so that the control of the inventory becomes much more easier and effective. The basic principle of the classification of inventory is based on **Pareto's Law.** Vilfredo Pareto, an Italian philosopher and economist while studying the economic status of the population of a given city, found out that 20 % of the people have got 80 % of the total money and rest of the 80 % of the people were having 20 % of the money. This finding of Mr. Pareto is equally applicable to so many other spheres of life as well as in the classification of inventory management. This philosophy helps in classification and subsequently identification of the items, into various categories which enable the store mangers, to manage and control the items more effectively and efficiently. Based on the utilisation pattern and/or some other criteria the store items can be classified as per one or in combination of more than one type of classification given below in Table 4.1.

Table 4.1 : The Types of Selective Inventory Control

Types of Control	Basis	Main Use
1) A-B-C	Value of consumption of item	Control inventory value
2) H-M-L	Unit Price of item	Control purchase
3) X-Y-Z	Value of items in store	Review inventories
4) V-E-D	Criticality of item	Inventory control of spares
5) F-S-N	Consumption pattern of items	Control obsolescence
6) S-D-E	Problems of procurement	Lead time analysis and purchasing strategies
7) G-O-L-F	Source of supply	Procurement strategies
8) S-O-S	Nature of supply	Procurement and holding strategies for seasonal items

Manager of each individual store is required to apply any one or combination of more than one type of the above mentioned classification, as per the requirement of his/her store. Analysis of doing some of these classifications like A-B-C and V-E-D are given in detail in the following pages.

4.3 METHODOLOGY OF INVENTORY ANALYSIS

Inventory control is basically a scientific system which indicates as to what to order, when to order, how much to order, how often to order so that the purchasing costs and storing costs are kept as low as possible. The two basic techniques of inventory control, which can be very effectively used in the medical stores, are A-B-C analysis and V-E-D analysis.

By now you have already learnt that the inventory analysis helps the materials managers to exercise selective control and focus his attention only on a few important items when he is confronted with thousand of store items. For doing this you have already learnt of the various types of classification of the store items in the previous para. In the following pages, we shall learn the two basic and appropriate techniques of Inventory analysis based on A-B-C and V-E-D classification of the items in detail.

A-B-C Analysis

A-B-C analysis is a basic analytical management tool, which enables any store managers to expand his effects and energy where the results will be the best. This analysis is purely

based on Selective Management Principle or Pareto's Law. It is also popularly known as "Always Better Control" or the alphabetical approach, has universal application in many areas of human endeavour. A-B-C analysis does not depend on the unit cost of the items but only on its annual usage and not on their importance because all items are important. Analysts commonly classify inventory into three categories 'A', 'B', and 'C'. The 'A' items have a high annual usage in terms of money investment. 'B' items are average, while 'C' items have a low value of usage. Every item in inventory is ranked and listed in order of items annual value of usage. At the top of the list would be the high value items, followed by a longer list of medium value items and finally a long list of low value items. The dividing line between classes of items is arbitrary. The normal items in most organisations show the following pattern:

1) 10 per cent to 15 per cent of the top number of items account for about 70 per cent of the total consumption value. These items are called 'A' items.

2) 20 per cent to 25 per cent of the number of items account for 20 per cent of the total consumption value. These items are called 'B' items.

3) The remaining 65 per cent to 70 per cent of items account for the balance 10 per cent of the total issue value. These items are called 'C' items.

It is evident that controlling the small number of items amounting to 10 per cent of the total number of items will result in the control of 70 per cent of the monetary value of the inventory held and ordered.

Hence, the main aim of this technique is to distinguish those items that have the most bearing on the inventory costs, so that management can concentrate efforts on those items that promise the highest possible pay offs in terms of savings. Thus, with A-B-C analysis more attention can be paid to few high value items rather than low value ones.

Mechanics of A-B-C Analysis

The mechanics of classifying the items into 'A', 'B' and 'C' categories is described in the following steps:

1) Calculate rupee annual issues for each item in inventory by multiplying the unit cost by the number of units issued in a year. It is assumed that the issues and consumption are the same.

2) Sort all items by rupee annual issues in descending sequence.

3) Prepare a list from these ranked items showing item no., unit cost, annual units issued and annual rupee value of units issued.

4) Starting at the top of the list, compute a running total, item-by-item issue value and the rupee consumption value i.e. cumulative cost of the items.

5) Compute and print for each item the cumulative percentages for the item count and cumulative annual issue value.

Short Cut Method to the A-B-C Analysis

Compute the average usage value and multiply it by 2.25 to get the dividing line between class 'A' and 'B'. The dividing line between class 'B' and class 'C' is taken as half the average usage value.

The average usage value can be obtained by dividing the total number of items by the total usage value per year (or month or week, depending on inventory practices). This data is available with the accounts department. This quick and rough method may have to be adjusted in the light of experience, or when a sample analysis or a complete analysis is made later. However, it will provide a reference value to start with.

Other than this mathematical analysis, A-B-C classification of stores items can be done by a graphical representation also.

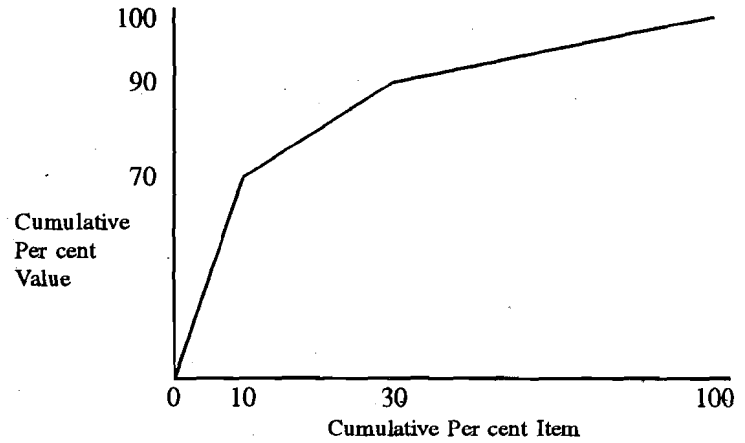


Fig. 4.1 : A Graph on Cumulative Value against Cumulative Percent of Items

A graph on cumulative value against the number of items arranged in the descending order list prepared to visually see the A-B-C categories. Instead of doing A-B-C analysis, as discussed earlier, many drug stores classify items by this graphical representation which is to be done purely on the visual assumption of the interpreter. Here as it is shown in the graph the vertical lines are drawn on the curve of the graph where it is showing the steep bends (as it is shown in Fig. 4.1). From this graphical analysis we classify the items (arranged in the serial order in the X-axis of the graph) into A category, B category, and C category of A-B-C analysis.

Hence, you must remember the basic principles in A-B-C analysis are:

i) the analysis does not depend upon the unit cost of the items but only on its annual consumption value;

ii) it does not depend on the importance of the item; and

iii) the limits for A-B-C categorisation are not uniform but will depend upon the size of the undertaking, its inventory as well as number of items controlled.

Purpose of A-B-C Analysis

The object of carrying out A-B-C analysis is to develop policy guidelines for selective control.

Normally, once A-B-C analysis has been done, the following broad policy guidelines can be established in respect of each categories (Table-4.2) :

Table 4.2 : Broad Policy Guidelines for the Control of Items as Per A-B-C Classification

	A Items High consumption value	B Items Moderate value	C Items Low consumption value
1)	Very strict control	Moderate control	Loose control
2)	No safety stocks (or very low)	Low safety stocks	High safety stocks
3)	Frequent ordering or weekly deliveries	Once in three months	Bulk ordering once in six months
4)	Weekly control statements	Monthly control reports	Quarterly control reports
5)	Maximum follow-up and expediting	Periodic follow-up	Follow-up and expediting in exceptional cases

6)	Rigorous value analysis	Moderate value analysis	Minimum value analysis
7)	As many sources as possible for each item	Two or more reliable sources	Two reliable sources for each item
8)	Accurate forecasts in materials planning	Estimates based on past data on present plans	Rough estimates for planning
9)	Minimization of waste, obsolete and surplus (review every 15 days)	Quarterly control over surplus and obsolete items	Annual review over surplus and obsolete material
10)	Individual postings	Small group postings	Group postings
11)	Central purchasing and storing	Combination purchasing	Decentralized purchasing
12)	Maximum efforts to reduce lead time	Moderate	Minimum clerical efforts
13)	Must be handled by senior officers	Can be handled by middle management	Can be fully delegated

V-E-D Analysis

The limitation of A-B-C analysis is that it is based only on monetary value and the rate of consumption of the items. Sometimes, particularly in a hospital, an item of low monetary value and consumption (e.g. Injection Adrenaline, Anti-Snake Venom etc.,) may be very vital or even life saving. Their importance cannot be overlooked simple because they do not appear in A category of inventory. Therefore, another parameter of the materials is their criticality. This could be in terms of the therapeutic value of a drug or intrinsic value of the material in achieving the objectives of hospital system. V-E-D analysis is based on critical values and shortage costs of the item. Based on their criticality, the items could be classified into three categories – Vital, Essential and Desirable.

Mechanics of V-E-D Analysis

V-E-D classification is applicable to a large extent in spare parts management. Stocking a spare part is based on strategies different from those of raw materials. While the consumption of raw materials depend directly and definitely on the market demand, the spare part demand, on the other hand, depends on the performance of plant and machinery. Therefore, the method of classification designed for one type of inventory may not be compatible with another type of inventory. Statistically too, it has been noted that the demand for spares follows a Poisson distribution. Spare parts are classified as vital, essential and desirable to the operation of the equipment. This implies that 'V' class spares have to be stocked adequately to ensure continuity in the operations of the plant. Vital spares can cause havoc and bring the wheels of the machines to a grinding halt, if they are not available. Some risk can be taken in the case of 'E' class spares. Stocking of desirables, 'D', can be done away with if the lead time for procurement is low. It is important that this classification should be done with the assistance and concurrence of those who are responsible for maintenance of stores. Hence for the management of the drug stores also the same classification can be applied for the drug items. Applying the following principles can do the classification of the drug items as per V-E-D analysis:

1) **Vital items**: There are several vital items in the inventory of a hospital, which could make difference between life and death. There can be serious functional dislocation of patient care when such items are not available even for short period adversely effecting the image of the hospital. Such items should always be stocked in sufficient quantity to ensure their constant availability. Top management should control this group of items.

2) **Essential items**: The shortage of such items can be tolerated for a short period. If these items are not available for a few days or a week, functioning of the hospital can be adversely affected (drugs like Antibiotics etc.). Top/Middle level management should preferably control these items.

3) **Desirable items**: The shortage of these items will not adversely affect the patient care or hospital functional even if the shortage is prolonged (Items like Vitamins). Middle/lower level management should control desirable items.

As against the cost criteria in A-B-C analysis the V-E-D analysis is based on subjective analysis by a group of physicians. The group is required to sit together and decide/classify the store items according to its critically into **vital, essential and desirable category.** The criticality of the item will be depending upon the objective and the functioning of the hospital in general and the various service departments in specific. Hence, the V-E-D classification will vary from hospital to hospital and even within the hospital, department to department.

Such an analysis enables the administrator to give more attention to vital and essential items.

Combination of A-B-C and V-E-D Analysis

A combination of A-B-C and V-E-D analysis can be gainfully employed to evolve a meaningful control over the material supplies particularly in a hospital system.

There are two models of this combination, which are generally in use (as shown in Fig. 4.2):

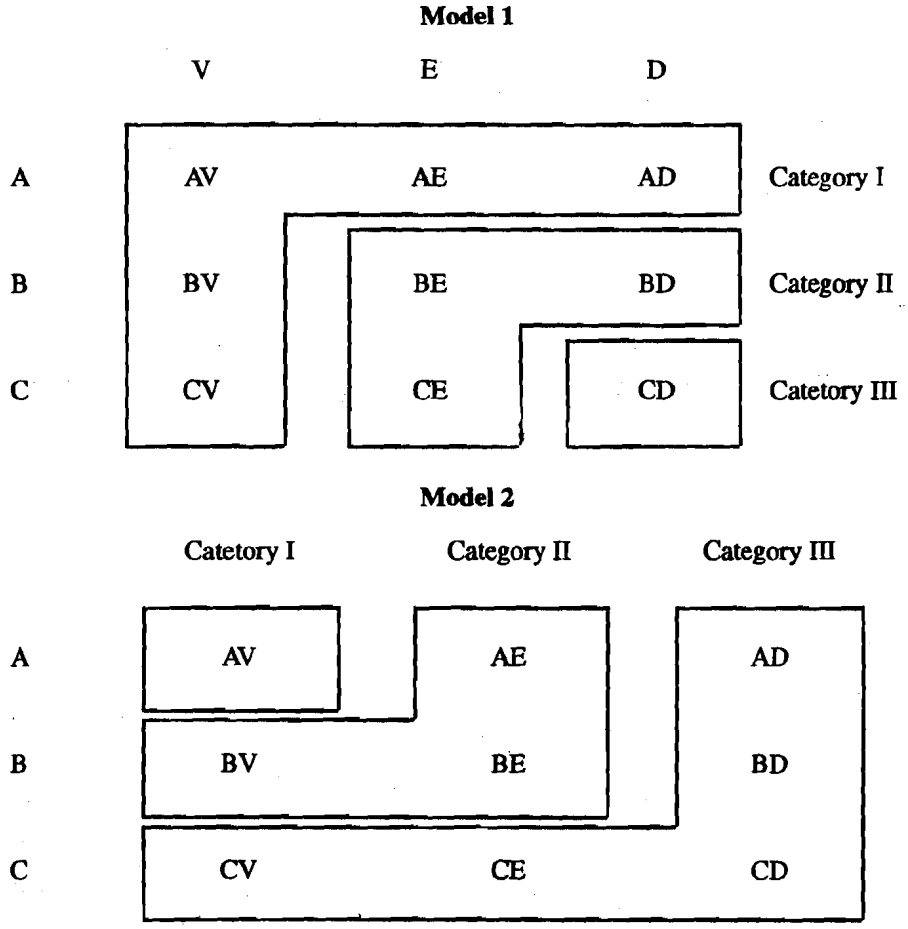

Fig. 4.2 : Models of A-B-C and V-E-D Combinations

Category I includes all vital and expensive items. These require close monitoring and strict control.

Category II covers items of essential category and they are less expensive.

Category III comprises the desirable and cheaper group of items.

A high degree of control on inventories of each item would neither be practical considering the work involved nor worthwhile since all items are not of equal importance. It is desirable to classify them into groups of items to control, which is commensurate

with its importance (Table 4.3). These analyses are based on the principle of "Vital few Trivial many", and a higher degree of attention is focussed on vital few which affects the results significantly. The service levels of various items should take into account of these classifications and from the overall objective point of view.

Table 4.3 : Control of Items by A-B-C and V-E-D Combination

Classification	V-Items	E-Items	D-Items
A Items	Constant control and regular follow-up	Moderate stocks	Nil stocks
B Items	Moderate stocks	Moderate stocks	Very low stocks
C Items	High stocks	Moderate stocks	Low stocks

X-Y-Z Classification

In contrary to A-B-C classification, which is based on value of annual consumption, X-Y-Z classification is based on value of inventory available on a particular date in the store. This classification is required to be done at least once in a year. X items are those items whose stock value is high, while Z items are those whose stock values are low. Understandably Y items fall between the two categories. This classification helps in identifying the items, which are being extensively stocked. If this is not properly done in time one may find C items in the X category. Therefore, controls should be developed for A-B-C items in conjunction with X-Y-Z items.

As V-E-D classification is based on the criticality of the item, at times it can be used in the case of some special materials, which are difficult to obtain. A combination of V-E-D and X-Y-Z methods may give some indication about the items that should be disposed off so as to trim the inventories.

Procedure to Carry out X-Y-Z Analysis

After annual stock-taking is over, arrange the closing stock values of items in descending order, enter the respective cumulative values against each item; the descending number of item is computed as a percentage of the total of all items in stores; the cut-off points are set depending on the distribution.

F-S-N Classification

The classification of the items is based on the consumption pattern or the movement of the items from the store. Items are classified as **fast moving, slow moving and non-moving** based on their consumption pattern. If there is rapid change in technology, this classification should be updated more often.

F-S-N analysis is specially useful to control obsolescence, spillage and deterioration in all kinds of items. Cut-off points for fast-, slow- and non-moving items usually depend on the characteristics of the items, their value and utility for operations. For example, zero issues may be placed in the non-moving class, as many as 10 issues in the past two years may be placed in the slow-moving category, and more than 10 issues in the fast-moving category.

Combination or X-Y-Z and F-S-N Classification

The combination of X-Y-Z and F-S-N classification can be more successfully applied to control the piling up of obsolete items. Disposal of obsolete items becomes important to prevent building up of the inventory over the years. Organisations have to choose between obsolete items as dead investment or prevent obsolescence by timely and appropriate control. The X-Y-Z and F-S-N classification exercise (Table 4.4) will help in timely prevention of obsolescence.

Table 4.4 : Combination of X-Y-Z and F-S-N Classification for Control of Store Items

Classification	F Items	S Items	N Items
X Items	Impose tight inventory control	Reduce stock to low level	Dispose of items at the best price
Y Items	Apply normal inventory control	Keep low level of stock	Dispose of as quickly as possible
Z Items	Increase stocks to reduce clerical work	Keep low level of stock	Dispose of even at low price

4.4 INVENTORY CONTROL ANALYSIS

You have already learnt the principles and the methodology of Inventory Analysis. Also you have understood the importance and significance of the classification of store items in various ways and in combinations to get the better result for management of inventory. Now let us see how we can classify the commonly occurring drug items available in our drug stores so that we can have a better control over these items.

Steps to do A-B-C Analysis

For this refer to the list of hundred drug items given in the annexure. The list of these drug items shown in the Annexure is taken from the actual drug list of a medium size hospital. The steps do the A-B-C analysis from this list is as follows :

Step 1

Identify all the drug items given in the list and check the estimated quantity to be consumed during a year and also the unit cost of each of these items. Then you are required to calculate the annual consumption cost of each item. You can drive the annual consumption costs by multiplying the unit cost of the item and estimated quantity to be consumed during a year.

Annual consumption cost = Unit cost of the item × Total quantity consumed per annum

Step 2

Once you have calculated the annual consumption cost of each of the items, arrange the same in the descending order list i.e. the costliest item (as per the annual consumption cost) at the top followed by next and so on and at the bottom will be the least costliest item. Exactly in the similar way the drug items are arranged in the list given in the annexure.

Step 3

After arranging the drug items as per the descending order list, we have to calculate the cumulative amount of each item. The cumulative cost of the first item is the annual consumption cost itself. The cumulative cost of the second item will be the cumulative cost of first item plus the annual consumption cost of the second item. Similarly, the cumulative cost of the third item will be the cumulative cost of the second item plus the annual consumption cost of the third item. In this manner you are required to calculate the cumulative cost of each item separately and the figure is to be mentioned against that item as it is shown in the drug list given in the annexure under the column cumulative amount.

Step 4

Once you have done the cumulative cost of each item separately, you will find that the cumulative cost of last item is also the total expenditure incurred in procuring all the drug items of the hospital for a year. Now as we know that 70% of the total cost takes care of around 10-15% of the drug items, which are shown in the descending, order list. Hence, if you calculate the 70% of the final cumulative amount of Rs. 2,54,51,234 as given in the

drug list, you will find the value of Rs. 17815864. Now in the column of the cumulative amount of the drug list, try to find where this value is lying. In our drug list you will find that this value is lying between item no. 12 and item no. 13, because the value calculated above is more than the cumulative amount of item no. 12 is less than the cumulative amount of item no. 13. Hence this is the dividing line which demarcates that all the items above this line i.e. all the drug items upto item no. 12 of the re-arranged list are Group 'A' Items as per A-B-C classification.

Step 5

Once you have identified the Group 'A' items, next step is to identify the Group 'B' items. For this we already know the 70% of the expenditure spent on Group 'A' items. Also as per ABC analysis, 20% of the expenditure will be on about 20-25% of the items. Hence, for the calculation we add up 70% + 20% i.e. 90% and find out the value of 90% of Rs. 25451234. If you calculate, you will find a value of Rs. 22906111. In our drug list you will find that this value is lying between item no. 33 and item no. 34, because the value calculated above is more than the cumulative amount of item no. 12 is less than the cumulative amount of item no. 13. Hence all the items from Sr. No. 13 to 33 of the drug list i.e. 21 in no. are Group 'B' Items as per A-B-C classification. Rest of the 67 items of this drug list is the Group 'C' items as per A-B-C classification.

Step 6

Hence from the above A-B-C analysis of the given drug list consisting of 100 drug items, you have seen :

Group 'A'	12% items	70% of the total expenditure
Group 'B'	21% items	20% of the total expenditure
Group 'C'	67% items	10% of the total expenditure

This is how the A-B-C analysis is done for classifying the items of any drug store into Group 'A', Group 'B', and Group 'C' items.

Steps to do V-E-D Analysis

As you have already learnt for doing the V-E-D analysis, we don't have any mathematical calculation. The V-E-D analysis is to done through discussion and arriving at a common consensus among the experts or the users of the drug items. In the given list also the same exercise is done by some of the doctors of that hospital according to their priority for each drug item. The result of the V-E-D analysis done by these doctors are given along with the drug list. But it must be remembered that this V-E-D analysis of the given drug items are not to be universally accepted by all the doctors and all the hospitals whereas the A-B-C analysis which we have already done will be universally acceptable.

4.5 LET US SUM UP

In this unit, you have learnt about the practical aspects of the Inventory Analysis. You have learnt how to classify the store items by various methods and apply the same for controlling the items as per their use. Also you have learnt how to combine more than one type of classification and apply them to control the items in the store for better management of the store items. You have also learnt how to do the mathematical calculation of store items as per the A-B-C classification.

UNIT 1 EVOLUTION AND CLASSIFICATION OF HOSPITALS

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- define a hospital;
- discuss the evolution of hospitals;
- classify the various types of hospitals; and
- describe the hospital as a system.

1.1 INTRODUCTION

You must be fully familiarised with the hospitals as you are professionally brought up in the hospital environment while undergoing graduation courses. But to become a full-fledged Hospital Administrator, you must know how the hospitals are organised and what are its expected functions. To understand these aspects you must be knowledgeable that how the hospitals evolved from early civilisation to modern era and also the classification of hospitals by various ways. In this Unit, you will learn all about the above mentioned aspects i.e. definition of hospitals, history and evolution of hospitals, classification of hospitals and hospitals as a system.

1.2 DEFINITION OF HOSPITAL

The Hospital is an organisation that mobilises the skills and efforts of widely divergent group of professionals, semi-professional and non-professional personnel to provide highly personalised services to individual patients. Like other large organisations, hospital is established and designed to pursue certain objectives through collaborative activity. The main objective of the hospital is, of course, to provide adequate care and treatment to its patients (within the limits that may be imposed by the scarce resources and by extra-organisational forces). Its principal product is medical, surgical and nursing service to the patient, and its central concern is the life and health of the patient. A hospital may, of

course, have additional objectives, including its own maintenance and survival, organisational stability and growth, financial solvency, medical and nursing education and research and various employee-related objectives. But, all these are subsidiary to the key objectives of service to the patient, which constitutes the basic principle that underlies all activities in a hospital.

Various literatures while describing the origin of hospitals stated that religious forces and institutions was the main force behind the development of hospitals rather than the development in the medical services. It is at times difficult and complex task to dissociate development of hospitals from religion as in some cases like early Roman or Greek civilisation, temples of Gods were utilised as hospitals. But in 400 BC Hippocrates made it possible to separate medicine from religion on rational grounds.

Modern hospitals are very complex socio-economic, scientific and highly labour-oriented organisations. Still they owe their origin to the sufferings and ailments of people and to the compassion and zeal amongst some philanthropers, to relieve these sufferers from agony of suffering and discomfort.

Today hospital means an institution in which sick or injured persons are treated. A hospital is different from a dispensary because hospital being primarily an institution where in-patients are received and treated while the main purpose of a dispensary is distribution of medicine and administration of out-door relief.

There are many definitions of hospital available in literature and dictionaries, but not a single definition is perfect in defining a modern hospital and its multifarious services. Even with WHO, there is no proper definition available. The WHO expert group has defined the role of hospital as:

WHO Definition of Hospital

Hospital is an integral part of a social and medical organisation, the functions of which are to provide the population, complete health care both curative and preventive with out-patient services reaches out to the family in its own environment and also to carry out training of health workers/functionaries and the bio-social research.

Other than this WHO definition, the definition given in the "Directory of Hospitals in India, 1988" is to some extent simple and short. According to this definition, "A hospital is an institution which is operated for the medical, surgical and/or obstetrical care of in-patients and which is treated as a hospital by the Central/State Government/Local Bodies or licensed by the appropriate authority".

Check Your Progress 1

1) Fill in the blanks:

   i) The term 'Hospital' is derived from the word .....

   ii) As per WHO definition a hospital is a ..... and ..... organisation.

2) Write True (T) or False (F):

   i) The main objective of the hospital is to provide adequate care and treatment to its patients. (T/F)

   ii) Modern hospitals are not labour oriented organisations. (T/F)

   iii) A hospital and a dispensary serves the same purpose. (T/F)

1.3 HISTORY OF HOSPITALS IN INDIA

The Hospitals in India have a long history in its development starting from the ancient time i.e. from the Era of Emperor Ashoka or may be much earlier than that of Vedic Era to the more recent modern hospitals. The brief accounts of the same are as follows:

1.3.1 Development of Hospitals in Ancient India

In India, the history of hospitals can be traced back to the times of Emperor Ashoka (273-232 BC), who not only built the most outstanding of the early hospitals for human beings, but also for animals with the motive and intention to spread Buddhist ideology of sympathy for the sick and every creature in his kingdom should be healthful without 'soka' (i.e. without lamentation and depression). Charaka and Sushrutha of ancient India were famous physicians. Medicines based on the Indian system (basically Ayurveda) was taught in the University of Takshilla and Nalanda, which probably contributed to the advances in Arabic medicine. The "Upakalpa-viyam Adyayam" of Charake Suthresthanam gives specifications for hospital buildings, labour rooms and children wards. The qualifications for hospital attendants and nurses as well as specifications for hospital equipment, utensils, instruments and diets have also been given. There is evidence to show that there were many hospitals in South India in the olden days, as observed in Chola and Malakapuram edicts.

The historical account of the ancient Indian medicine cannot authentically be described for want of inscription and manuscripts or other records as are available of other system of medicines such as of Egypt. But we do find from the books written by Arabian and European travellers (about 600 A.D.) that the study of medicine in India was in its bloom. Every major city had a medical school. The decline of Indian medicine started from the Mohammedan invasion in the 10th century A.D. which was a period of unrest. The zeal of the native "Vaidyas" for the investigation of the Indian flora slackened for want of encouragement. The invaders brought with them their own physicians called "Hakims" who followed Greek system of medicine generally worded as "Unani". Under imperial patronage, the "Hakims" began to prosper at the expense of "Vaidyas". The maintenance of hospitals in India declined during this period considerably but it gained impetus only in British period in the 16th century A.D.

Thus, in ancient period, roughly up to 18th century, system of medicine and practice known as "Ayurveda", "Siddha" and "Unani" were in practice. Except these practices and functions the ancient hospital did not cater to the acute and serious sickness as do the hospitals of modern times. But they were mainly concerned with the care of the sick for the balance of their lives.

The use of "Allopathic" system of medicine commenced in the 16th century with the arrival of European missionaries in South India. It was during British rule that there was once again progress in the building of hospitals. Though the first hospital in India was probably built in Goa, as mentioned in Fryer's Travel, the East India Company established its first hospital in 1664 for its soldiers and another in 1684 for civilians at Madras. The establishment of a hospital in Bombay was under discussion in 1670 but apparently it was not actually taken up till 1676. The earliest hospital in Calcutta was built in 1707-1708 and in Delhi in 1874.

During 17th and 18th centuries, there was a slow but steady progress in the growth of the modern system of medical practice in India and the indigenous system was pushed to the background. In the 19th century, modern medicine took firm root. Medical care based on this system spread all over India, mainly through the efforts of the missionaries.

The Portuguese organised hospitals of the European type at Calicut (Kerala), Goa and Santhome (Madras) through missionary organisations. They set up treatment centres and trained local men and women as dressers, nurses etc. In the early stages, missions were financed by foreign sources but later on when the people realised their value, local support and subsidies were available.

Organised medical training started in the 19th century and precisely in 1822, the East India Company established a medical school at Calcutta and in 1835 made it a medical college, followed by one in Madras. In the beginning both the modern system and Ayurvedic system were taught. Later on when the universities were started, some of the medical schools were taken over and converted into medical colleges. At the end of the 19th century, there were four medical colleges in India in addition to a number of medical schools with lower levels of instructions i.e. L.M.P. etc.

By the end of 19th century, the attitude of community towards hospital system also began to change. They started realising that hospitals are not meant for the terminal stages of disease and life, and hence the dumping place for the patients of chronically ill or at the terminal stage of the disease. As a result of this, importance was given to the hospitals and the

volume of work increased and the whole picture (i.e. structure, administration, functionary etc.) greatly changed.

In the early years of 20th century, more efforts were made to remove the stigma on the performance and a bad image of the hospitals by transferring their administration from "Public Assistance Powers of Local Administration" to the "Health Committees", and these hospitals, later were named as "Public Health Hospitals". Many hospitals and dispensaries, originally started to treat army personnel, were handed over to the civil authorities for treating the civilian population. Local governments were encouraged to start hospitals at the taluk and district levels and gradually they were taken over by the states or provincial governments and run as taluk and district hospitals. The members of the Indian Medical Service ran many of these district hospitals at the provincial headquarters. Some hospitals at the provincial headquarters were converted into teaching hospitals and attached to medical colleges.

Between the World War I and II much thought had been given to the reorganisation of hospital services by the constitution of number of Commissions of Inquiry on the subject. Further, after the wars, the civilian hospitals were encouraged to adopt the methods of "rehabilitation" or "fitness" centres as a means of restoring the lives of patients to working capacity. Thus, these centres, really and undoubtedly did valuable work, not only in surgical conditions, but in a wide range of medical treatment as well.

1.3.2 Development of Hospital Services after Independence

After attaining freedom, there was rapid industrialisation in the country; but at the same time there was continuous growth of population which caused a number of medical and health problems. On the eve of independence, there were 7,400 hospitals and dispensaries in India. There were 1,13,000 beds, giving bed population ratio of 0.2 per thousand population. There were 19 medical colleges and 19 medical schools. It was also realised that due to rapid increase in population which was unable to cope up with the limited availability of resources in all forms i.e. man, money and materials, the poverty went on increasing. Also as a consequence the various medical and health problems started cropping up in a big way for whole of India. Special efforts were, therefore, made to solve those health problems and various committees were set up from time to time with definite terms of references. These Committees as per their objectives and terms of reference, gave their recommendations about health care, medical care and hospital administration. Some of these important Committees were: Bhore Committee, Mudaliar Committee, Jain Committee, Shrivastava Committee, Sidhu Committee, Rao Committee, Bajaj Committee etc.

According to Health Information India (1995-96), as on 1st January 1996, India had 146 medical colleges, also more than 15,097 hospitals with over 6,23,819 beds admitting about 30 million patients each year (with a bed population ratio of about 0.67 beds per 1000 population) and giving treatment to an un-estimated number of out-door patients.

Out of all these hospitals and beds, there are 4621 rural hospitals with over 1,22,453 beds available. In the urban areas there are about 10,416 hospitals with the number of beds around 5,01,368. When these hospitals are divided into the Government, local bodies and private and voluntary, 4473 Government hospitals have 3,75,987 beds, 335 local bodies' hospitals have 19,677 beds and 10,289 private and voluntary hospitals have 2,28,115 beds.

Since independence, though lot of advancement has been made in the field of medical sciences in the country, still the availability of beds for the general population is far below than its actual requirements. The total number of beds available at the time of independence was roughly about 0.25 per 1000 population. Though this figure has increased to 0.75 beds per 1000 population till 1991, but again in 1995 this figure has come down to 0.67 beds per 1000 population (Refer Table 1.1). Still all these figures are far below the national target of atleast 1 bed/1000 population that was recommended by Mudaliar Committee way back in 1961. Even to maintain this current bed/population ratio with the existing trend of need population growth, require that 6000-7000 beds still need to be added every year. If this much number of beds are not added then the availability of the beds will go on decreasing and will result to over crowding and further mis-management of the existing Hospitals.

Table 1.1 : No. of Hospitals, No. of Hospital Beds and No. of Beds all types along with ratio

Years (As on 31/12/92)	No. of Hospitals	No. of Hospitals per 1000000 population	No. of Hospital Beds	
			Actual	Ratio per 1000 population
1951	2694	7	-	-
1961	3054	7	-	-
1971	3862	7	-	-
1981	6804	10	476226	68
1982	6897	10	486805	68
1983	7189	10	500628	69
1984	7369	10	514989	69
1985	7474	10	535735	71
1986	8067	10	555264	72
1987	9803	12	585889	74
1988	10840	13	598059	74
1989	11079	13	602490	74

1991	11174	13	642103	75
1992	13692	16	596203	70
1993	14867	17	615156	69
1994	15033	17	621250	69
1995	15097	16	623819	67

* Figures are provisional

Source: Directorate of Health Services (1995-96)

Even this ratio of 1 bed/1000 population is far below than the bed/population ratio available in other developed and developing countries. The figures in some of these countries are:

US/USA/Europe	:	About 10-15 beds/1000 population
Scandanevian Countries	:	About 18 beds/1000 population
Erstwhile USSR	:	About 20 beds/1000 population
Sri Lanka	:	About 3-5 beds/1000 population
Thailand	:	About 3 beds/1000 population

Also another striking feature observed over the last one decade was that the number of hospitals/beds available with the Government set-up is decreasing considerably in comparison to the number of hospitals/beds available with private and voluntary set-up. (Refer Table 1.2)

Table 1.2 : No. of Hospitals and Beds Available with Government set-up and with Private and Voluntary Organisations in Various Years

Sl. No.	Year	No. of Hospitals and Beds in		Total
		Govt. (Including Local Bodies)	Pvt. & Vol. Organisations	
1.	1983	3879/352539	3022/134266	6901/486805
2.	1989	4504/421025	5641/177034	10145/598059
3.	1992	4757/435215	6417/206888	11174/642103
4.	1993	4579/385216	9113/210987	13692/596203
5.	1995	4808/395664	10289/228155	15097/623819

Source: Health Information India 1983, 1989, 1992, 1994 & 1995-96

To begin with more number of hospitals and their beds were available with Government set-ups. The private and voluntary organisations were not that much involved. But over the years with the change in policy of the Government the trend is gradually changing. Now, as

it is shown in Table 1.2, more number of Hospitals and their beds are available with private and voluntary organisations. Government is investing proportionately less for construction of hospitals and increasing the number of beds in its existing infrastructures. The main reasons for this may be:

i) Lack of resources and trained manpower available with Government.

ii) Recent change in policy with the Government i.e. to induct and encourage the private and particularly the voluntary and non-governmental organisations to be involved in health care delivery system and mainly in the secondary and tertiary level of health care in which hospitals are one of the important aspects.

1.4 CLASSIFICATION OF HOSPITALS

As you know, there is no universally accepted method for classification of hospitals available. In the year 1988 for the first time an effort was made and it was published in the Directory of hospitals in India. The Directory of Hospitals in India—1988 lists the various types of hospitals and the types of management. Based on this the hospitals can be classified in many ways. They can be classified according to their objectives or according to the type of patient treated or according to ownership and control. The various commonly accepted criteria for classification of the modern hospitals are as follows:

1.4.1 According to Directory of Hospitals

a) ***General Hospital***: All establishments permanently staffed by at least two or more medical officers, which can offer in-patient accommodation and provide active medical and nursing care for more than one category of medical discipline (e.g. general medicine, general surgery, obstetrics, paediatrics etc.).

b) ***Rural Hospital***: Hospitals located in rural areas (classified by the Registrar General of India) permanently staffed by at least one or more physicians, which offer in-patient accommodation and provide medical and nursing care for more than one category of medical discipline (e.g. general medicine, general surgery, obstetrics and paediatrics).

c) ***Specialised Hospital***: Hospitals providing medical and nursing care primarily for only one discipline or a specific disease/affection of one system (e.g. tuberculosis, ENT, eye, leprosy, orthopaedic, paediatric, cardiac, mental, cancer, infectious disease, venereal diseases, maternity, etc.). The specialised departments, administratively attached to a general hospital and sometimes located in an annexe or separate ward, may be excluded and their beds should not be considered in this category of specialised hospitals.

d) ***Teaching Hospital***: A hospital to which a college is attached for medical/dental education.

e) ***Isolation Hospital***: This is a hospital for the care of persons suffering from infectious diseases requiring isolation of the patients.

1.4.2 According to Ownership and Control

Hospitals can also be classified on the basis of ownership and control. The hospitals classified according to this are shown in Fig. 1.1. Few of these types are discussed below:

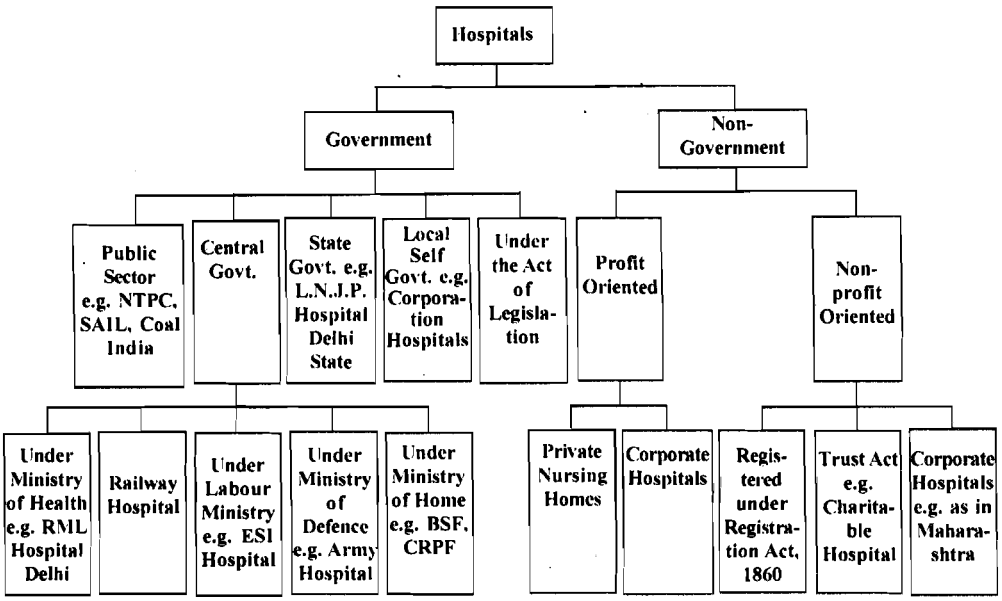

Fig. 1.1: Classification of Hospitals on Ownership Control Basis

a) ***Public Hospitals***: Public hospitals are those run by the Central Government, State Governments, Local Bodies and public sector undertakings etc. on non-commercial lines. The hospitals may be general hospitals or specialised hospitals or both. General hospitals are those that provide treatment for common diseases, whereas specialised hospitals provide treatment for specific diseases like infectious diseases, cancer, eye diseases, psychiatric ailments, etc. General hospitals can diagnose patients suffering from infectious diseases, but refer them to infectious disease hospitals for hospitalisation, as general hospitals are not fully equipped to treat infectious disease patients.

b) ***Voluntary Hospitals***: Voluntary hospitals are those which are established and incorporated under the Societies Registration Act, 1860 or Public Trust Act, 1882 or any other appropriate Acts of the Central or State Governments. They are run with public or private funds on a non-commercial basis. No part of the profit of the voluntary hospital goes to the benefit of any member, trustee or to any other individuals. Similarly, no member, trustee or any other individual is entitled to a share in the distribution of any of the corporate assets on dissolution of the registered society. A board of trustees, usually comprising prominent members of the community and retired senior officials of the government, manages such hospitals. The board appoints an administrator and a medical director to run such voluntary hospitals. These hospitals spend more on patient care than what they receive from the patients. There is, of late, a trend among voluntary hospitals to charge reasonably high fees from rich patients and very little from poor patients. Whatever they earn from the rich patients of the private wards is spent on the patients of general wards. However, the main source of their revenue are public and private donations, and grants-in-aid from the Central

Government, the State Governments, and from philanthropic organisations, both national and international. Thus, voluntary hospitals run on a 'no profit no loss' basis.

c) ***Private Nursing Homes***: Private nursing homes are generally owned by an individual doctor or a group of doctors. They accept patients suffering from infirmity, advanced age, illness, injury, chronic disability, etc. or those who are convalescing. They do not admit patients suffering from communicable diseases, drug-addiction or mental illness. There is, however, no uniform definition for nursing homes. The phrase may refer to out-of-home care facilities that offer a range of services similar to many found in a hospital. These nursing homes are run on a commercial basis. Naturally, the ordinary citizens usually cannot afford to get medical treatment there. However, these nursing homes are becoming more and more popular due to the shortage of government and voluntary hospitals. Secondly, wealthy patients do not want to get treatment at public hospitals due to long queues of patients and the shortage of medical as well as nursing staff leading to lack of medical and nursing care.

d) ***Corporate Hospitals***: The latest concept is of corporate hospitals which are public limited companies formed under the Companies Act. They are normally run on commercial lines. They can be either general or specialised or both.

Some of the other criteria for classifying the hospitals are as follows:

1.4.3 According to the Systems of Medicine

The hospitals in very broad terms may also be classified according to the system of medicine that is been practiced there. Hence the hospitals are named as "Allopathic", "Homoeopathic", "Ayurvedic", "Naturopathic", "Unani", and "Siddha" etc.

1.4.4 According to the Bed Strength

Arbitrarily the hospitals can be classified into large, medium and small, depending upon the number of beds available in that hospital. Roughly any hospital having more than 500 beds is a large hospital, one having the bed strength between 200 to 500 is a medium hospital, and a hospital having less than 200 beds is a small hospital.

1.4.5 According to Clinical Basis

A clinical classification of hospitals is another basis for classification. Some hospitals are termed as "General Hospitals" whereas others are "Specialised Hospitals" according to the speciality it is dealing with. In a general hospital, patients are treated for all kind of diseases but in a specialised hospital, patients are treated only for those diseases for which hospital has been set-up, such as heart disease, cancer, eye, maternity, gastro-enterology, neurology, psychiatry etc.

1.4.6 According to Length of Stay of Patients

Hospitals can also be classified according to the length of stay of patients. A patient may stay for a short-term in a hospital in the diseases like gastro-enteritis, fever etc. or may stay for long-term for the treatment of diseases such as tuberculosis, cancer, schizophrenia, etc. Therefore, a hospital may fall either under the category of short-term or long-term (now known as acute and chronic-care hospitals respectively) according to the period of stay in the hospital.

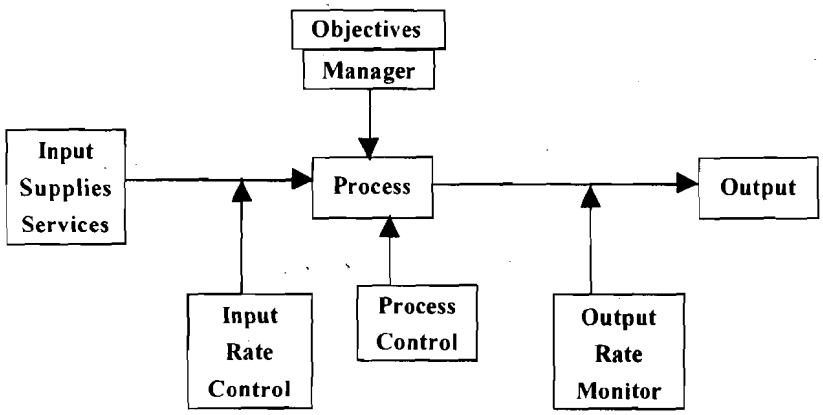
1.5 HOSPITAL AS SYSTEM

The hospital system has its external environment and linkages. Therefore, to understand the hospital system, one has to look at the hospital as an open system. A general hospital, within the immediate environment of health care organisation and the larger environment of the community are interdependent. The hospital services have to be considered as a socio-technical system within the health care system that copes with the constraints from both the internal and external environment.

Definition of System

A system has been defined in the Oxford English Dictionary as simply "a set or assemblage of things, connected, or interdependent, so as to form a complex unity; a whole composed of parts in orderly arrangement according to some scheme or plan." To be more precise a system is a hierarchical chain of systems and sub-systems, interconnected and interdependent, having clear objectives at each level of the system or subsystem, obtains enough inputs from its environment to offset its output, and operates with varying processes or methods to achieve the ultimate objective of the system. As per Katz and Khan social systems are anchored in the attitudes, perceptions, beliefs, motivations, habits and expectations of human beings.

The system as defined is illustrated below:



The above figure represents a model of a system or a subsystem, which has a clear objective, and consists of three basic elements, i.e. input, process and output. Each component of a system is controlled in a manner as to achieve the ultimate objectives of the system or subsystem.

In hospital patient is key input, but human resources, personnel of various categories and other resources like drugs and supplies, equipments, information, research findings and feedback from the output also constitute part of the total output.

In the systems approach, quality of output is an important variable that affects input in any part of the hospital. With increased concern for sick patients or beneficiaries, attention has also to be directed towards external environment outside hospital organisation. This complicates the problem because under the circumstances hospital has become the impact point because when patient enters a hospital, a great many groups get involved both inside and outside the hospital to treat him and help him to recover.

Inside, patient is concerned with admissions, diagnosis, treatment and provision of ancillary house-keeping services. Outside, he is involved with relatives, hospital rules and regulations and the community. This makes hospital a much more complicated system and the character of the hospital would much depend on the patient's flow in the hospital. Thus patient system becomes basic to the hospital system.

1.5.1 Functions of Hospital

The size of a hospital, the patient flow and the community needs also determine the nature of sub-systems required for effective functioning. The main functions of the hospitals are:

a) **Restorative or Curative**

This includes diagnosis, treatment, rehabilitation and to provide emergency medical care.

b) **Prevention of Diseases and Promotion of Health**

Supervision of MCH and family welfare includes immunisation, control of various communicable and non-communicable diseases, health education. Also hospital is a centre where the health education activity for the community can be done very effectively. As the patients and their relatives are in a right frame mind to accept and subsequently practice the preventive and health promotive measures for the diseases from which they are suffering.

c) **Surveillance Centre**

Surveillance centre for both communicable and non-communicable diseases can also generate most reliable mortality and morbidity data for the area or community to which this hospital is rendering its service.

d) **Education and Research**

Basic education, various inductions and in-service training programmes for graduate and post-graduate doctors, nurses and other paramedical staff.

e) **Professional Support**

Intellectual and professional support need to be provided to medical practitioners at stipulated cost.

f) **Early detection of epidemics**

Hospitals particularly the outpatient departments play a very important role in early detection of the epidemic along with the definite geographical mapping of that area and the population at risk. As the OPDs are the places where the first patient of the potential epidemics usually arrives well before the epidemic is actually breaking out.

g) **Primary Health Care (PHC) Programme**

To become a part of primary health care (PHC) programme, every hospital need to take some role such as:

i) To provide support to PHC.

ii) To promote community health development action.

iii) Basic and continuing education to workers engaged in PHC.

iv) Research on PHC (How to remove various socio-cultural barriers) etc.

The hospital should regard health as a value and focus on prevention, use of appropriate technology, community involvement and multi-sectoral approach. The strengthening of co-ordination through improved exchange of information collected through passive surveillance by the hospital is an important aspect. The value of information feedback with regard to referrals and communicable diseases from the field to hospital and hospital to field is essential. Moreover it is important for undertaking epidemiological measure and saving the community from lots of serious diseases.

1.5.2 Hospital Organogram

Hospital organisation is unique because of the various complexities involved therein. These complexities have been varying with increasing interest of all sections of society within the hospital. The complexity of the modern hospital results from a number of attributes:

1) There is a wide diversity of objectives and goals for different personnel and sub-system.

2) The diversity of personnel ranges from highly qualified and skilled physicians to unskilled and uneducated employees. Enabling them to work as a team is a challenge.

3) In many areas of hospital operation, there are dual lines of authority. Administrators are responsible for solving a wide variety of management problems and physicians are responsible for patient care education and research. Often, these two seemingly distinct areas of activity overlap, and, in fact, some employees may have two or more persons to whom they are responsible.

4) The problems of life and death put tremendous pressure on administration and functioning of hospitals.

5) The patient care rendered in the hospital has eluded precise measurements.

6) Simple management principles like unity of command, order, unity of objectives etc. become difficult to apply in different situations.

All these factors coupled with the special importance of hospital, make it difficult to fit it into any of the traditional organisation structures like line, line and staff or functional organisations. In view of the fact that hospital functionaries cannot avoid duality of controls at different levels and the fact that simultaneous vertical and horizontal controls are necessary for achieving the objectives of the hospitals.

In the following pages the terms of references and recommendations about health care, medical care and hospital management specifically contained in the reports of some significant committees are described briefly.

1.5.3 Role of Hospitals in Primary Health Care

Hospitals can play and should play a very important and vital role for providing primary health care to the community. Even to the extent, it can give a leading role for providing primary health care in a given area. The role of hospital in primary health care could be better understood by knowing the health systems operating in that area. It is based on the following factors:

1) The extent to which population served by that hospital is well demarcated.

2) The number and size of other hospitals available in the area.

3) The type of ownership of the hospitals and the interaction between them.

4) The level of development of hospital services in relation to community health needs and comprehensiveness of the services.

5) The level of adequacy of referral arrangements.

The situation in the country is such, that so far development of other health care sub-systems are weaker than the hospitals. This situation to some extent is universal in all health systems. The hospitals are too dominant, secondly too little attention is paid to the

links between hospitals and primary health care and its workers in the field. The institutions still lack co-ordination and clearly defined role boundaries.

The situation is further complicated because most of the hospitals in Government sectors are facing the most severe financial and manpower problems, whereas the hospitals in private sectors though by and large are not having any such problems to a great extent, still they are not committed for providing primary health care. Hence, the question, for the Government hospitals, who are the main providers for primary health care, is not how they take newer roles but rather how they can contain the cost and quality of services and survive in their present crisis.

However, the experiences of different countries of the world can provide certain insights into the possible roles which hospitals like to pursue to fulfil the goals of Health For All through primary health care. Those experiences have shown that:

1) Hospitals have played their part in health education and health promotion and their example will be of significance to health promoters.

2) Community involvement is fundamental to the primary health care and it applies to hospitals as much as to any other parts of the health system.

   But the key issues of community participation are:

   a) The kind of participation to achieve the specific goals.

   b) Who should participate from community?

   c) The type and method of participation.

   It requires radical change in the thinking of the medical professionals in the hospital and close interaction with health care providers in non-governmental and private voluntary organisations too.

3) Hospitals can play a role in planning, co-ordination and even implementation of at least such health programmes as:

   a) Mother and child at risk.

   b) Programmes requiring surgical assistance.

   c) Single disease care programmes throwing cases for hospitalisation.

   d) Referral load of cases detected during follow-up.

   e) Diagnostic back-up services.

   f) Specialist back-up services.

   g) Sentinel centre for immunisation programmes.

   h) Passive surveillance centre for many diseases.

   i) Logistic support for drugs and other equipments.

4) In developing referral system as an integral part of the district health care system, referral is a critical problem. The movement of patients between the different levels of health care is one of the aspects that effect the population most directly. The effectiveness of the system will depend on people's confidence in the hospital system and in other levels of the system and the personnel working therein.

5) Providing technological support to different levels of health care.

6) Extending specialist consultation services to out-reach areas in order to understand and prioritise community health problems and screen cases for future health camps and referral.

   Thus, hospital as an institution might benefit from being redefined as a community health-oriented institution which means that it is not only disease-oriented but has responsibilities in the field of health prevention and promotion as well as acquires skill and perspective about more developmental aspects of primary health care and its management.

1.6 LET US SUM UP

In this unit you have learnt about the evolution and classification of the hospitals. Right from the vedic era and era of Emperor Ashoka how the hospitals have slowly and steadily developed to this era of modern medicine. Also you have seen how many types of hospitals are there and their classification according to various ways. After more than 50 years of Independence, with lot of pride we can claim that this country has made tremendous development in the field of Medical Care. Thanks mainly goes to the latest advent of technology in the field of Medical Care particularly the Tertiary level care. Also honour goes to the specialists in this field who are considered one of the finest in the world. This development also is possible for the policy decision taken by the Government regarding privatisation of the Secondary and Tertiary level of health care which is primarily taken care by the Hospitals only. With the combined effect and efforts of all these, India is becoming one of the top most country in the world, where the best quality of hospital services will be available.

You have also learnt that, even after 50 years of Independence an average Indian Hospital continues to be primitive and underdeveloped. Incidentally these are the Hospitals mainly used by majority of the common people and are run by the Government or Public Sectors. Whereas though above mentioned private hospitals are providing quality services but they are so costly hence are practically beyond the reach of a common citizen of the developing country like India. Further you have learnt about the post independence seenario of hospitals.

After independence, the medical care through the hospitals was mainly in the government sector i.e. through Central Government, State Governments or in Public Sectors. Only few hospitals were available in Non-government Sectors (mostly in voluntary organisations). With the advent of latest technology and super specialisation in medical care the cost started increasing in leaps and bounds. Also the maintenance of the super specialised/tertiary level hospitals started becoming very costly, that too when the services are to be provided free of cost. Hence, the government took a decision (National Health Policy, 1983) that by and large the government will not be having any new hospital until otherwise it is absolutely necessary. Rather the private sector and the voluntary organisations will be encouraged and given incentives to set up new hospitals. Government as and when required would buy the services from these hospitals. As a result of this decision after 1986 no new major hospitals had come up in the government sector whereas lot of hospitals are there in the Non-government sector during this period. As a result of this, now we can see the number of hospitals are more in Non-government sector (almost double the number) than in the government sector.

Towards the end of this unit you have learnt about hospital as a system, its function,

UNIT 2 HOSPITAL ORGANISATION

Structure

2.0 OBJECTIVES

After going through this unit, you should be able to:

- describe briefly hospital as an organisation;
- understand evolution of hospital administration;
- understand functioning of hospital;
- describe five subsystems of hospital viz. clinical nursing, diagnostic, supporting and auxiliary services; and
- describe hospital as matrix organisation.

2.1 INTRODUCTION

In this unit you will learn about hospital organisation. Hospital is made of subsystems of clinical departments, nursing services, diagnostic services, support services and auxiliary services. The best way to organise hospital is by matrix organisation.

In this unit you will learn about hospital organisation, as to how it is organised by departmentation or as matrix. The hospital is made up of a series of departments, which work together in a system to render medical, nursing and support services. You should also relate hospital as an organisation within larger spectrum of health care.

You should think hospital as complex organisation having departments of multi-discipline managed by medical, nursing, para-medical and service personnel. You as a budding hospital administrator should think of organising hospital only by departmentation which has its own merits and de-merits and also think of multiple factors like cost of medical care, the type of hospital clientele it is serving and their expectation.

You are aware of diversity of agencies owning hospital like governmental hospitals which include centre, state and local bodies, charitable organisation, private hospitals and corporate hospitals providing medical care services, hence there is no uniformity pertaining to hospital organisation. Even there is no uniformity between all government hospitals hence you would see that there is no universal model that can be applied in organising hospital. The hospital organisations of this millennium would also be effected by new techniques of tele medicine, information technology and TQM (Total Quality Management). The developing countries also have to think health care at affordable cost and thus organise their hospitals accordingly.

2.2 HOSPITAL AS AN ORGANISATION

You should try to think about hospital as a social organisation, as it is rational combination of the activities of a number of people for achievement of a common purpose or goal by

division of labour and function and through a hierarchy of authority and responsibility.

Organising is a process of grouping the necessary responsibilities and activities into workable units determining laying of authorities and communication and developing patterns of coordination, this would involve systemising of all technical and administrative activities so as to effect satisfaction to customers, employers and agencies that make it possible to organise. The organisational structure would depend on size of hospital.

You would perceive the top management is to direct and coordinate the activities of heterogeneous group of other subordinates managing various hospital services. Each of them exercise control over a unit. These departmental managers include at the upper end of the management scale the "line" managers of medical and nursing units like chief of medical/ surgical divisions, ward matrons, in charge of operation theatre etc. None of these may consider themselves as managers and they are also not formally trained for any managerial function.

The organisation process should culminate into a common goal towards which collective efforts are directed and the goal is spelt out in detail. There is a need for clear authority-responsibility relationship that power and authority factor need to be reconciled so that individual organisations are productive and goal directed and there is a clarity of organisational relationship, to reduce conflict that the unity of command must prevail and that authority must be delegated. You would also see that traditionally most hospitals have been structured according to a classical theory of organisation. The hospital organisation may be considered as it may have a structure making a pyramid organisation but functionally it would best fit into matrix organisation. This can be explained to students better by a

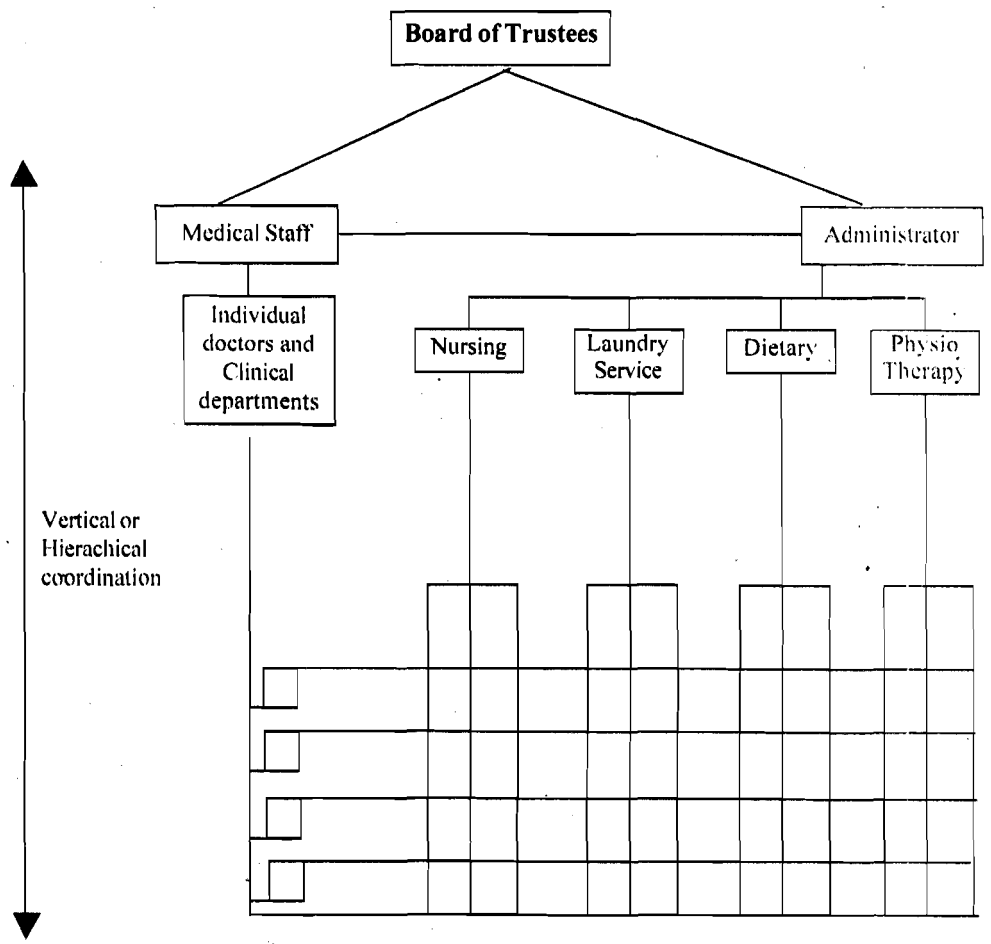

Fig. 2.1: Matrix Organisation

diagrammatic representation of matrix organisation:

The hospital organisation can be defined diagrammatically for better understanding of the students, however various hospitals depending upon their philosophy would have different organisational structure to provide patient care, the very purpose for which hospitals are created. One such organisational chart is shown in Fig. 2.2 for your understanding.

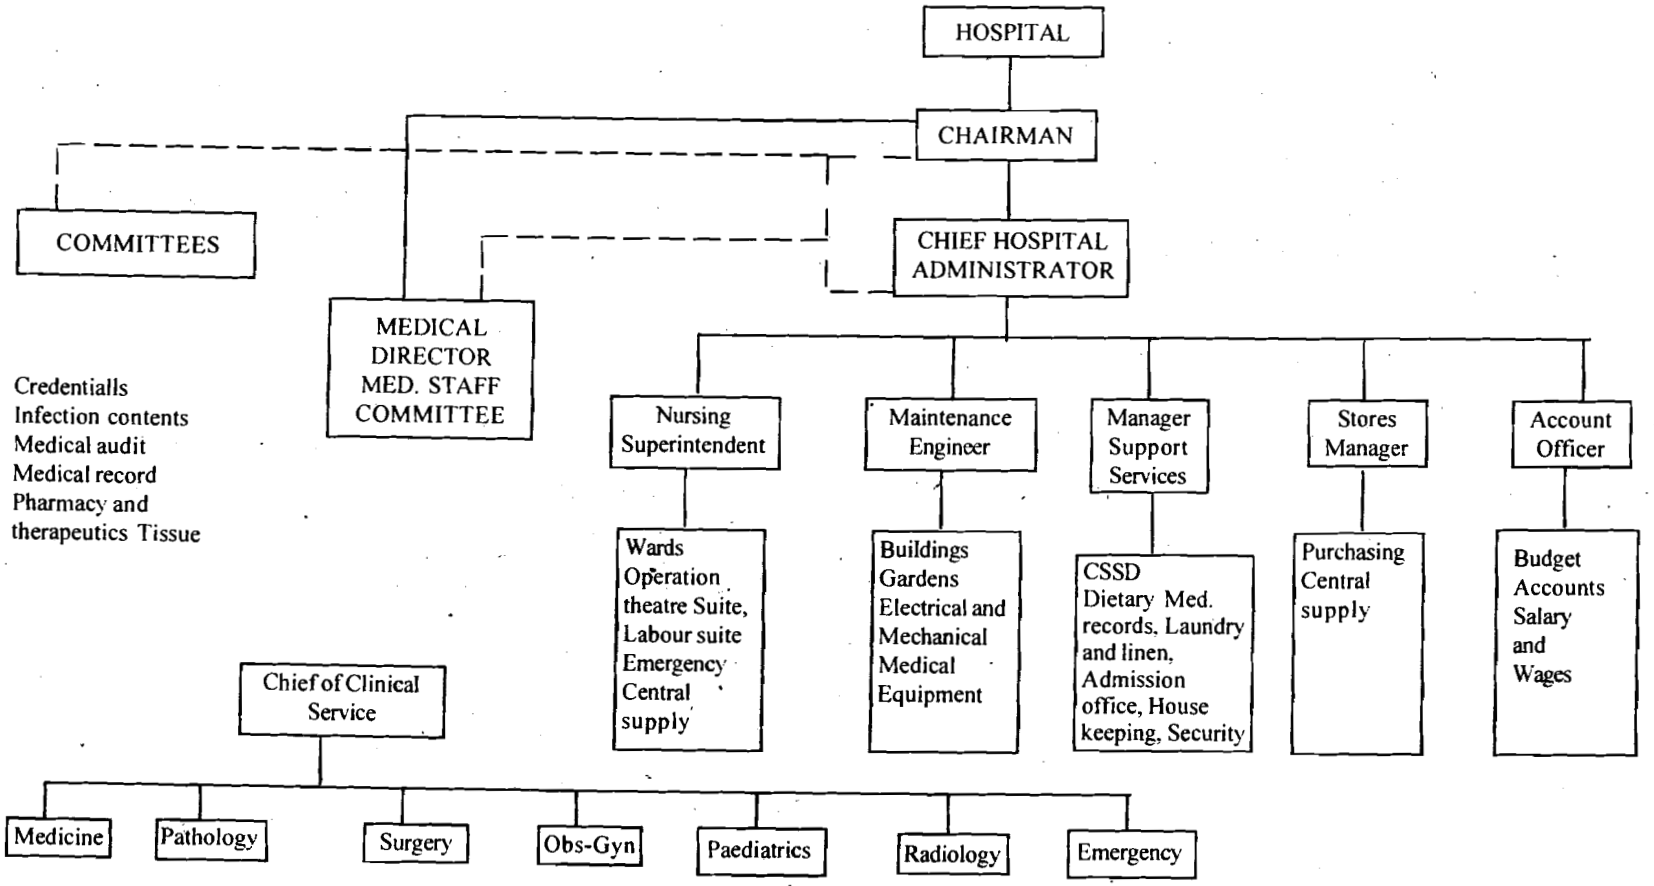

Fig. 2.2: Organisational Chart

——— **Direct Reporting**
– – – **Advisory Relationship**

2.3 EVOLUTION OF HOSPITAL ADMINISTRATION

The profession of hospital administration is unique because hospitals are complete organisation where highly qualified professionals are working in a " life and death" activity, and to manage such organisation the professionals require special skill; hence hospital administration evolved as a discipline over a period of time where very few formally trained hospital administrators are available in the developing countries, while most of the hospitals are being managed by managers who had on the job training and managing by the principle of traditional approach. Though hospitals have administrative and service functions that are common to other commercial enterprises, but it requires integrating with highly technical and clinical services with administrative and service departments like laundry and hospital engineering services functioning alongside highly technical, nursing and medical care activities. This variety and complimentary are what make hospital administration such a demanding profession.

In earlier days hospital administrators were selected from the rank of nursing service and registered nurse had been serving as hospital's head administrator. In Church hospital administrator was frequently selected from the rank of religion order.

In mid 1930 first formal university course for hospital administration was developed. The American College of Hospital Administration (ACHA) is an organisation that has influenced advancement of the profession of hospital administration. After World War II the field of hospital administration gained in status as the need for formally trained hospital administrators increased, however, the situation in developing countries including India is grim as hospital administration as a profession is still in infancy due to non availability of trained hospital administrator and pressure from clinicians to hold seat of "authority".

In 1939 American College of Hospital Administration designed a code of ethics for hospitals and health care executives, which defines as how health care executives should function within highest standard of ethical performance. The code has since undergone several revisions in order to keep pace with change in the profession.

The clinician and practicing physicians are taking greater role in hospital management and decision making process because it effects their professional lives and these clinicians are ever taking management roles as hospital's full time medical director.

The main task of hospital administrator is to coordinate hospital's resources in order to fulfil institution's medical care objective in the most efficient and effective way possible. He should manage personnel, materials, equipment and finances and is responsible for all function including medical staff functions, nursing, technical and general service activities.

The hospital administrators of 1940s and 1950s were primarily concerned with institutions' internal operation and those activities directly supporting care of hospital's patients. The hospital industry changed dramatically subsequently since many Governmental regulations came into existence. The hospital administrator has now two roles to perform, firstly managing those activities that went on in a hospital and secondly to understand and participate in community activities and assess the needs of community as these influence hospital's functioning. The hospital administrator of today is expected to show leadership within hospital and outside institution's walls. The major role of hospital administrator is also public relations and educating community about hospital matters to make hospital more acceptable by community.

2.4 HOW A HOSPITAL WORKS?

You should understand that hospital functions as 'matrix organisation'. The experts in hospital field have recognised that complex task and highly skilled professional workers call for colleageal participatory structure while semi skilled and unskilled to do repetitive nature work require hierarchical formalised structure. Thus there has to be matched physician at one end and services handled by lower expertise personnel like laundry, dietary services and housekeeping on the other end of spectrum while nurses and technical fall in between these two categories. Thus there are two schools of thought, first one is to run hospital on hierarchical basis and second to run it on cutting the vertical line horizontally and making hospital a matrix organisation. Thus matrix is a problem solving management concept where conventional philosophy or system cannot effectively function in a hospital system. Thus

matrix can be considered as contingency or situational theory of management. This process integrate them into temporary group with the objective of solving a complex problem that formal organisation and routine methods cannot solve.

The clinicians thus consume hospital services and resources for their department from hospital system and this forms lateral horizontal coordination across various services.

The hospital is organised under governing body and functions under a hospital administrator. The hospital has broadly five main components firstly clinical services where all clinicians under various departments provide medical care to the patients, secondly nursing services where all nursing personnel provide nursing care to patients, thirdly professional or diagnostic services like laboratory and radiology services, fourthly ancillary services like laundry, dietary and housekeeping services and fifthly auxiliary services like public relation department, welfare service, religious services and hospital inn etc. The students should study hospital working under these five main components and categorise various departments under these sub systems, which are covered under Courses IV and V to follow.

The hospital should organise itself with unity of command, proper span of control, delegation of authority, coordination, line and staff relationship and function as matrix organisation. These aspects are already covered under Course I.

You should understand that there is no one best way to organise a hospital. Traditionally hospitals are organised in a classical organisation mode which served them well and still does to great extent. The modern day hospitals are always seeking better ways to manage. It is clear that hospitals, that will succeed will do so by adapting to change.

.....

.....

.....

2.5 MEDICAL STAFF AND HOSPITAL ORGANISATION

The greatest impact the medical staff has on hospital is its role in the quality of care provided by the hospital. The responsibility of governing body and hospital administrator is to monitor quality of medical care in the hospital provided by medical professionals.

The medical profession is highly trained and motivated professional group but these clinicians or medical staff vary greatly in their approach to care. In present era of knowledge explosion there are many super and sub specialities having very individualistic approach. The task of "Coordinating" the collective efforts of medical staff is a challenging one for the administration.

The medical staff functions as per rules, regulations, policies and guidelines laid down by the hospital board and administration. In India unfortunately we are not yet able to develop standards and guidelines for the hospitals like the ones developed, by joint commission of accreditation of hospitals in USA with the result each Indian hospital in his own wisdom had developed its own guidelines and standards and there is no monitoring body for assessing quality care of the hospital and accrediting hospitals.

The medical and clinical staff can be managed through management principles of Total Quality Management. They could be governed by developing its own rules, regulations and policies through various committee methods like organising utilisation committee, medical review, Infection control, medical record, tissue committee and various such committees where clinicians are told to assess their own quality of care to the patients and these committee reports are perused periodically by governing board and hospital administration. The details of these committees need to be studied by the students from various text books of hospital administration.

The monitoring of Quality Assurance is a necessary function of medical staff. The students should read details of medical audit, Quality assurance, TQM and accreditation of hospitals for better understanding of the subject.

The medical director is a member of hospital management board, he is not answerable to medical staff but to hospital administrator even though they work with clinical problem and medical staff issues. The medical director's responsibility is utilisation review, quality assurance and aiding hospital management in understanding medical staff policies. In fact new buzz word is now 'Total Resource Planning' of hospital and students should read about principles of the management philosophy.

The aim of hospital director and medical staff in organising hospital is providing quality care to the patients.

2.6 PROFESSIONAL SERVICE DEPARTMENT IN HOSPITAL ORGANISATION

The professional service departments are those departments which assist physician and medical team in diagnosing and treating the patient like Laboratory services, Radiology department, Physiotherapy department and Cardiac cath lab. However, it is Radiology and Laboratory services which invariably exist in every hospital hence students should study in detail and visit these departments in hospitals to have better understanding. These departments are revenue generating departments in private hospitals and are more complex than other hospital departments because they perform a variety of services that make great use of sophisticated equipment and technology and highly trained technical staff.

There have also been a lot of technological advancement in these departments in last two decades which student would like to know. There have been advancement in imagining by adding ultrasound, CT Scan and MRI and in laboratory services by use of semi and auto analysers and use of various kits. One could now diagnose with precision by using these diagnostic aids.

Laboratory services are part of pathology department which has shown tremendous growth and has great impact on patient care. The clinical laboratory services include bacteriology and blood banking. In 1950 virology, cytology and fluorescent studies in the hospitals were added. The primary purpose of present day hospital clinical laboratory is to assist physicians and other members of hospital's health team in diagnosis, prevention and treatment of diseases and illness by performing tests. This department has a major impact on QA programmes in a hospital. The laboratory reports are critical to come to a diagnosis of the patient and thus to provide quality treatment in hospital, QA is very necessary. The WHO has QA programme for laboratory services and in India accreditations of laboratory services have been organised in a humble way.

You while studying any department should think of space and design of department, its function, staff requirement, organisation, operation and functioning of the department, record generation, policies and procedure, equipment and material planning and its maintenance, quality assurance and total resource planning and assess department's capabilities and limitation through these indicators.

The radiology department made its beginning with invent of x-ray by professor of Physics Dr. W. Roentgen on 08 Nov., 1895 and since then there is no looking back for radiology department and entering into era of sonography, computerised tomography (CT) and magnetic resonance imaging (MRI).

Many of the procedures as in pathology department are performed on out patient and from emergency department. The department depending upon various facilities available is divided into diagnostic, therapeutic, radiology and nuclear medicine. In bigger hospitals all these three departments make independent entity while in smaller hospitals same department does all three functions. You students should see this difference by visiting radiology department of small and big hospitals.

Check Your Progress 2

.....

2.7 LET US SUM UP

In this unit you have learnt hospital as an organisation, its peculiarities, problems and ways and means to solve by management principles and understand hospital as a "matrix organisation".

The evolution of hospital administration and to understand the variety and complexity is what makes the hospital administration such a demanding profession.

You have learnt that hospital has five such components viz. clinical, nursing, diagnostic, ancillary and auxiliary.

You have been sensitised with various management principles applicable in the hospital field to provide cost effective medical care.

2.8 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) a) Managing those activities that went on in a hospital.

   b) To understand and participate in community activities and assess needs of community as these influence hospital's, functioning.

2) Five main components :

   a) Clinical Services

   b) Nursing Services

c) Professional or Diagnostic Services

d) Ancillary Service

e) Auxiliary Services

3) In 1939 American College of Hospital Administration designed a code of ethics for hospital and health care executives.

Check Your Progress 2

1) Various committees are: utilisation committee, medical review, infection control, medical record, tissue committee and various such committees where clinicians are told to assess their own quality of care to the patients.

2) Department of laboratory medicine or laboratory services.

UNIT 3 ROLE OF HOSPITALS

Structure

3.0 OBJECTIVES

After studying this unit, you will be able to:

- enumerate the various functions of hospitals;
- discuss role and peculiarities of hospitals and also challenging role to keep pace with rapid updation of technoloy and science;
- describe challenges hospital has to face; and
- deal with problems and select strategy for optimum functioning.

3.1 INTRODUCTION

This unit aims to familiarise you with the role and functions of hospitals within the community and futuristic challenges and changing role of Hospitals.

In the previous units of this block you have studied the process of evolution of hospitals, their classification, how hospitals are organised and functions as a system. In this unit you will learn about the role and functions of hospitals and how a hospital is related to the community it serves. You will also learn the peculiarities of hospitals which dictate the management needs, and the problems and challenges required to be handled by hospital. administration

3.2 EVOLUTION OF ROLE OF HOSPITALS

It is mentioned that early Hospitals in India were built by King Asoka (273-232 B.C.). The attendants were ordered to:

- give gentle care to sick
- furnish them with fruits and vegetables

- prepare medicines
- give massage
- keep their own person clean
- maintain confidentiality of patient

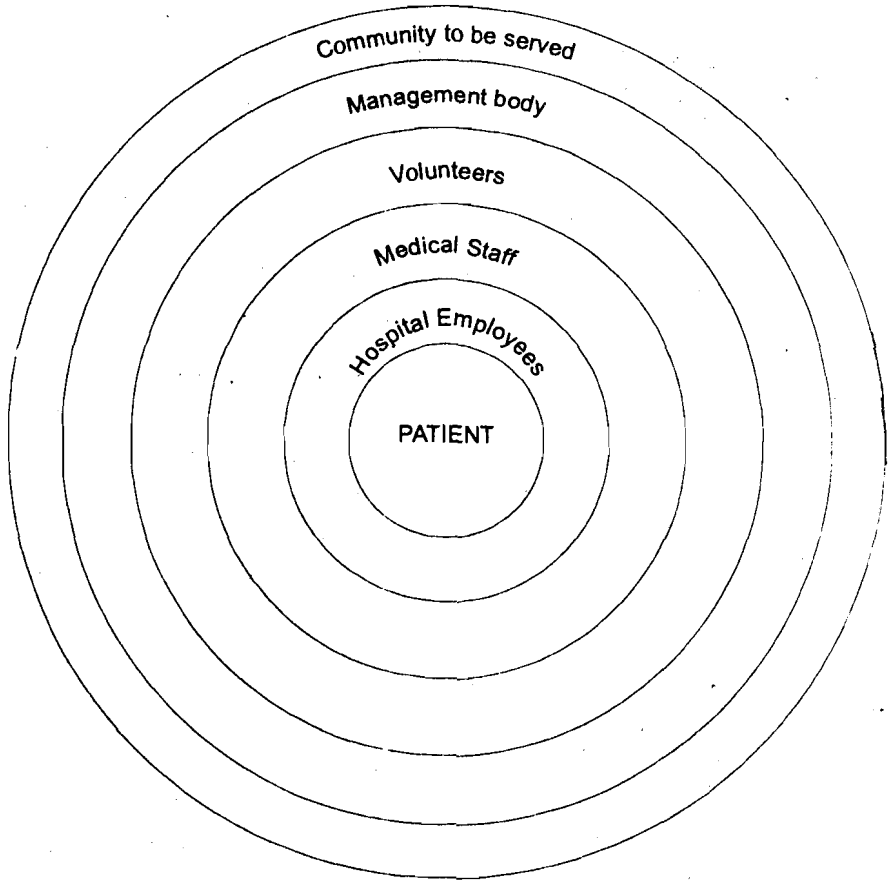
The story of the birth of hospitals is an indication of advancement of civilisation from individual to family and then to community. The word Hospital came from a common route Hospes (Latin) which means a guest and also a host. The hospital originated as a result of sympathy for sick and suffering.

The modern system of medicine was introduced in India in 16th Century. In 1943 Bed population ratio was 1.3 per 1000 and it was decided to increase this ratio up to 5.6 per 1000 in 25 years. Until 1960 there were 12000 Hospitals and 185000 beds in India and Bed Population ratio in 1960 was 0.4 per 1000 population only.

Hospital of today is the evolutionary product of long struggle. It is expression of man's right to be well and it is the formal recognition by the community or social structure of the country of its responsibility for providing the means of keeping him well. You know Health as defined by WHO is "a state of physical, mental and social well being and not merely absence of disease or infirmity". The task of hospital is to restore health of community. Therefore. Hospital is defined as "integral part of social and medical organisation the function of which is to provide complete health care viz. preventive, promotive, curative and rehabilitative and hospital is also a centre for training and research of medical and paramedical staff".

Hospital is also defined as an institution where "for the patient it is a place to receive medical care; to the physician it is a workshop in which he/she practices his profession; to medical or nursing student it is an educational institution.

Patient is at the centre of gravity in entire working of hospital as depicted in the figure.



Hospital is very complex organisation wherein patient is at the centre of gravity of entire operations. Hospitals are focal point of delivery of health care services to entire community irrespective of age, sex, cast, creed or colour. The diversity of staff contributing towards patient care from highly skilled physicians, nurses, technicians, administration and unskilled staff. Hospital has continuous operation (24 hours working) without true off makes it more

complex in nature. Hospitals deal with life and death and surprisingly in many areas of hospital operations there is dual line of authority.

Check Your Progress 1

Fill in the Blanks:

a) ..... is the centre of gravity in entire working of hospital.

b) In India in 1960 Bed Population ratio was.....

3.3 FUNCTIONS OF HOSPITALS

You know that hospital has broad responsibility of maintaining and restoring health of community. Therefore, functions of modern hospitals are:

3.3.1 To Take Care of Sick and Injured

To take care of any patient who is sick and injured is most primary function of the hospital. All other functions are subordinate and are recognized as part of the responsibility of the hospital because they contribute indirectly to the care of the sick.

The first requisite to give him proper accommodation in the hospital. Accommodation to the patient can be given according to:

- Physical condition of patient
- Social and financial status
- Availability

You are aware that patient needs to be admitted as per principles of progressive patient care. It means "right patient on right bed with right services around him". In other words patients are given accommodation according to the degree of illness and need. As far as condition of the patient is concerned may be seriously ill whose care has to be taken in Intensive Care Unit, where patient who is critically ill with potentially reversible lesions and who are unable to communicate their needs and who require extensive nursing care and needs constant observation irrespective of age, sex and economical status are admitted. From the second stand point of accommodating patients as per social and economical status hospital has special, semi special rooms and General wards for admission.

- Hospital should provide proper facilities for diagnosis and treatment with supportive services of radio-imaging, laboratory, and logistics.
- To provide efficient medical care through expert doctors, nurses and paramedical staff.
- Hospital needs to provide food services to patients. The diet of patient should be nutritious and have appropriate caloric value as per his disease requirements.

3.3.2 To Take Preventive Care and Health Promotion of Community

Other than the curative services, the hospitals required to play a very important role in hospital promotion and prevention from diseases. As the preventive medicine for many communicable diseases, hospitals are involved in various activities like, immunisation, MCH and family planning activities. Other than these, hospitals can be very effectively utilised for health education activities, as patients and their relatives are in right frame of mind to know more about the disease, which the patient is suffering from. Hence any health education activity imparted will be better accepted and practised.

3.3.3 Surveillance Centre

Hospitals may be the most important surveillance centre for non-communicable diseases other than communicable diseases as in a health care delivery system active surveillance is very minimal for non-communicable diseases.

Also O.P.D. of the hospitals can play a very crucial role in early detection of some disease out-breaks along with its geographical situation and population at risk.

3.3.4 Continuing Care of Patients

Patients are taken care after surgery till he is completely cured. It is done as a follow up measure and rehabilitation programme. There are certain diseases which are chronic in nature and need continuous follow up advise on repeated schedule of drugs, physiotherapy, and personalised care.

3.3.5 Rehabilitation

Hospitals can play a very important role in rehabilitation of the patients particularly who had some physical deformities. This is done through the development of physiotherapy unit and occupation therapy unit.

3.3.6 Education and Training of Staff

Hospital has to organise training programmes for various cadres like doctors — for their clinical/non-clinical subjects, for nurses, for paramedical (technicians) like x-ray technicians, ECG technicians and also for unskilled workers for cleanliness, maintenance, sterilization etc. other than the basic training courses for medical and nursing stafff.

3.3.7 Research

In hospital research is carried out on early diagnosis, treatment of patients. Research is carried out in relation by physical, psychological and social aspects of health and disease and also in technical and administrative aspect of hospital practices.

Check Your Progress 2

Which of the following is True/False?

a) Hospitals are not supposed to render preventive and promotive services. (T/F)

b) Research is one of the very important function of hospitals. (T/F)

c) Hospitals can be utilised as a very useful serveillance centre. (T/F)

d) Hospitals should not be used as a training centre for medical and para medical staff. (T/F)

3.4 ROLE OF HOSPITALS AND PECULIARITIES

Purpose

The purpose of Hospital Administration is provisioning of good patient care with efficiency and economy, within the resources available.

The Special Needs or the Peculiarity of a Hospital

The hospital as social institution facilitates interaction of a wide spectrum of the society from varied cultural and socio-economic stratum. The hospital is a media, through which the scientific technological innovation of Medical Sciences are put into operation and practised for healthful living of the community.

The peculiarities of a hospital as an organisation are:

a) The product of the hospital is 'service' which cannot be qualified in any economic terms and no objective criteria can be laid down to evaluate the standard of services.

b) The service in the hospital is always personalised, professional and directly rendered by the medical, nursing and other specialised personnel according to the needs and requirement of each case or client. As such the hospital service cannot be mechanised, standardized or pre-planned to meet the specific need. The hospital service is a term work rather than an individual service.

c) The hospital service is normally emergent in nature and no two situations are similar needing the same treatment. So the Hospital Administration cannot always be

preplanned in micro level implementation, with straight jacket formula. It is more often in management by crisis than management by objective.

d) The wide spectrum of people involved in the hospital activity ranges from the highly skilled professional to the man who may not have visited a school. Therefore, the management of this varied group of people calls for a balanced psychosocial approach.

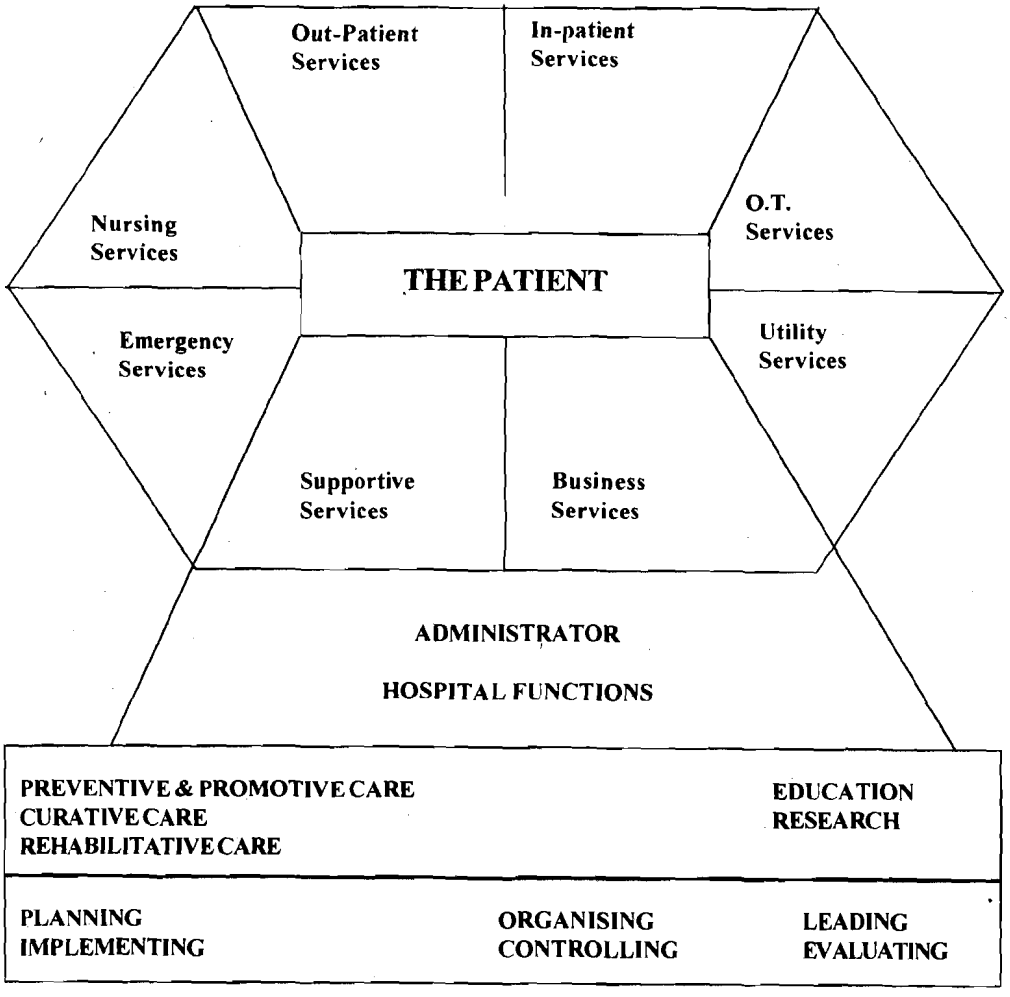
e) The dual control by way of professional authority and the executive authority in the Hospital invariably leads to management conflict which is a peculiar situation every hospital administrator has to face in the day to day operation.

f) Of late the hospital being treated as industry for profit as well for maximization of the output with minimal input has led to application of management tools and techniques for its administration.

In view of this peculiar nature the hospital administration is a multidisciplinary approach. It is an art of application of the principles of public administration, behavioural science and the modern management skill, in the milieu of scientific medicine to subserve the objectives of the hospitals.

Public Administration	For General Administration
Behavioural Science	Community and the people in the hospital
Management Science	Methodological improvement
Clinical Medicine and Community Health and *Epidemiology*	Hospital infection specialised service
Biostatistics	Planning and Forecasting

Patient Centered Activities and Services Offered by the Hospital



3.5 HOSPITAL AS A SYSTEM

From a management point of view the Hospital can be treated as an organised whole and termed as an open system. This hospital system can be grouped into four distinct sub-systems:

a) Clinical and Nursing Service — Primary Services

b) Supportive Services

c) General Administration and Business Services

d) Utility Services

Clinical and Nursing Services	Supportive Services	General Administration Including Business and Utility Services
1) Out-patient services	1) Radiological services	1) Personnnel Management
2) In-patient services	2) Laboratory Services	2) Financial Management
3) Emergency and casualty Services	3) Central Sterile Supply Services	3) House Keeping
4) Operation Theatre	4) Laundry Services	4) Material Management
	5) Blood Bank Services	5) Dietary Services
	6) Mortuary Services	6) Hospital Engineering Services
	7) Rehabilitation Services (Physical Medicine)	7) Transport
	8) Medical Records	8) Public Relations
	9) Medical Social Worker	9) Communications
	10) Pharmacy Services	10) Fire and Security

Thus, to sum up the hospital administration for the patient care services has become complex and multidimensional. It consists of coordinated activities provided by a variety of categories of health personnel, utilising a variety of precision equipment and skill and is spread over a large physical area of activity.

The Hospital Administration is responsible for synthesis of 'whole' organisation consisting of a wide skill of men and variety of materials into a functionally effective machine. The product of this machine is the 'service' or the 'medical care' provided by a hospital. This product is intangible and dependent on so many people acting individually and collectively and does not lend itself to easily definable standards or to simple units of measurement. No such ready indices are available, which can be universally applied to measure directly the quality of hospital care.

Check Your Progress 3

Which of the following is True/False?

a) Product of the Hospital service cannot be quantified in any economic term. (T/F)

b) Hospital services are usually of routine in nature. (T/F)

c) Wide specturm of people involved in hospital activity ranges. (T/F)

d) Dual control by way of professional authority and executive authority in hospital makes management easier. (T/F)

3.6 HOSPITAL AS COMMUNITY INSTITUTION

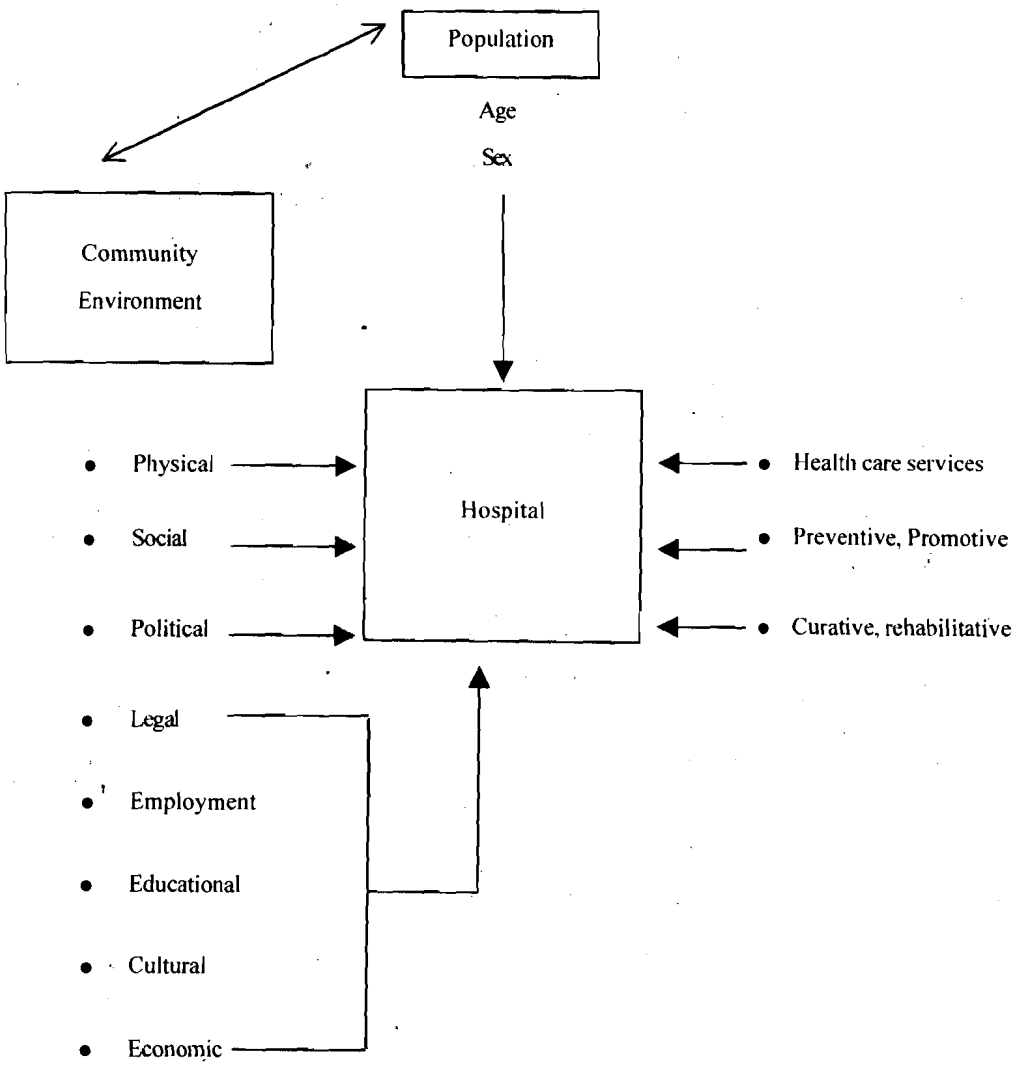
You know that a major part of health care facilities are delivered through hospitals. With changing era modern technology is also changing at a fast speed. Hospitals are delivering comprehensive health care i.e. Preventive, Promotive, Curative, Rehabilitative, Services to patient along with bio-medical research. Also education and training to various category of staff e.g. medical students, nursing, paramedical etc. Nowadays hospitals are not functioning in isolation but changing as community Institution. It is seen that participation of community for O.P.D. indoor treatment, immunization, preventive health check ups, early detection of diseases, rehabilitative programmes is ever increasing. In many places hospitals are built within a defined geographical area but do not belong to or catering local population of that area. Many a times community is not consulted hence they become foreign bodies. Facilities not meeting priority needs may lead to under utilisation of hospital. You are aware that large hospitals are overcrowded with minor or desperate cases and Rural Health Posts are bypassed.

In such cases Hospitals cannot operate because:

- Lack of Personnel
- Financial constraints
- Breakdown of Mechanical and Electrical, biomedical equipments
- Lack of Maintenance and repair facilities.

It is found that as the expectations of community is increasing with the development of medical technology, the demand is also increasing rapidly. It is not able to meet increasing demand at the same time maintain quality of patient care as staff becomes overworked and technical services overwhelmed. Reliability of health care facilities is of utmost importance. There must be a proper communication between hospital and socio-economic institutions like public works, industry, community development groups; agriculture etc.

Matrix of Health Environment and Community



Population dynamics and community environment is influencing in working of hospital as community institution.

3.7 CHANGING ROLE OF HOSPITALS

Changing and advancing technology with commitment to professional developments has brought great changes in the organisational structure of the hospitals. To keep pace with the changing environment and purpose, the role assigned to hospital administrator has changed considerably.

Hence, the hospital administrator's role in the future will include:

- Understanding the health system operating in the country.
- Awareness of the fact that decisions on planning and programming will be taken outside the four walls of the hospital. Types of services to be provided will depend on the community and regional councils.
- Greater involvement of the public and professional experts in the hospital affairs.
- Dealing with conflicting demands of the hospital board staff, clientele, and community.
- Need for practical resilience.

Today the modern hospital administrator has to strike a balance between inside management activities and outside communicator. Maintaining a positive relationship and effective communication with hospitals clinicians is an internal duty. The administrator has to provide feedback to the management board so that they can be assured that the hospital activities are consistent with the hospital mission.

Administrators are always under pressure to keep pace with changing times. They must develop new skills and apply old skills to new situations. The administrator also has a major role in educating the community about hospital matters, this role is particularly important as consumers clamor about rising hospital costs.

The most effective administrators are visionaries. Modern hospital administrators time and activities have changed greatly. Marketing public relations, medical staff relations and strategic planning are some of the key activities in which they are now involved.

Some areas in which hospital effectiveness is being questioned and the influence of administrator in these areas include:

1) Costs and financing of operations
2) Sharing of power for decision making
3) Organisational structure
4) Manpower utilisation
5) Patient care

Manpower Utilisation

Through job analysis, the skills, jobs and the knowledge required to perform existing tasks can be identified. This can result in a clustering of tasks into related skill and knowledge

activities. Job pathways can then be designed so that changes in output and technology can be handled by re-arranging job structures and selecting appropriate job specifications for assignment of new or different functions.

Patient Care

The responsiveness of hospital employees can be increased by establishment of units in which patient complaints are recorded and chronic offenders identified by confronting employees and their supervisors with written transcripts concerning unresponsiveness, or by confronting them with complainants and their representatives, the administrator may influence the behaviour of the employees. Continued motivation and training of employees will have favourable influence on their role performance.

Costs and Financing Operations

The administrator's influence on cost control is, at least potentially, most importantly exercised in the budgeting process. The administrator has greater influence over expenditures for new programmes and facilities. Substantial cost savings or increased efficiency, however, can probably be realised through real location of existing budgets, and better correlation of budgets to unit performance and not merely to historical cost levels. Performance budgeting assumes some quantifiable output at some given level of quality.

Cost control is seen as a legitimate administrative function by medical staff. As a representative of the organisation as a whole, the administrator is seen a likely mediator between conflicting demands and interests.

Sharing of Power

The problems of the administrator increases with the number of bargaining units and the number of the unions in any one hospital. Negotiating with unions on an inter hospital basis may result in individual hospitals securing the most expert representatives and is not being "whipsawed" by unions.

Organisational Structure

Structure refers to the organisation of tasks or task groups in units, of units in the organisation as a whole. The administrator can influence the development and implementation of formal programme of coordination.

Because of increased specialization, changing technology, and increased expectation of consumers and employees the hospitals require increased coordination and organisational adaptability. The administrator's expertise is that of a integrator structuring the perceptions among producers, and between producers and consumers, so that chain can be effected without destroying organisational integration. The administrator requires authority appropriate to this responsibility.

3.8 CHALLENGES AND STRATEGIES

3.8.1 The Problem

Hospital has become a highly scientific and complex medical institution as against age-old concept of a poor house where people left their incurable and dying patients.

Frequently a personal visit to a hospital will produce superficial impression of sick, quality of care, standards of hygiene and decoration, physical relationships of departments and many other things, but it will almost certainly not reveal anything about the hospital as a viable concern, and the way in which it is functioning, whether it is able to give its best to the community it serves by optimum utilisation of its resources.

The community is demanding more and better care at minimum cost in the hospital. A patient will no more tolerate the indifferent and impersonal treatment offered in our hospitals. An outpatient cannot tolerate forever, long waiting in queues for registration, consultation, X-ray, laboratory examination, or for a few tablets in the pharmacy-counter. A patient now not only demands professional care of sufficiently high standards; he also seeks more elaborate comforts and cleaner surroundings. An out-of-order equipment or non-availability of essential drugs and supplies is also resented upon by hospital patients. A trace of rude behaviour on the part of hospital staff may set off a chain of complaints and allegations. This is a challenge from the consumers of medical care.

Again, there are many problems within the hospital connected with management of human and material resources. A hospital social system constitutes a network of interpersonal relationship with varying degree of complexity. There are a great number of variables and any attempt to alter any one of them is likely to start a sort of chain reaction. Orders and policies, no matter how plainly stated, will be subject to interpretation in the light of psychological set of those who transmit them or carry them out, the environment in which they find themselves, and the conflicting pressures which they are subject to. Further, the interaction of the patient with other patients and their relations, as well as with hospital staff gets structured into a network of interpersonal relationship, constituting thereby, the human relation as an important element within the hospital social system. In order to deal with these social and technological forces it is necessary to use sound business judgement, based on knowledge of human behaviour and experience of actual operating systems.

The organisation and management of material resources in a hospital still presents a greater problem. Certain services are generated in all the service areas of hospital through provision of certain facilities in terms of physical facilities, manpower, equipment, furniture, suppliers, such as medicines, food staff, chemicals and so on. It has been common experience that a lot of costly equipment are purchased for use in hospitals without prior assessment of their expected output, availability of technical competence and facilities for maintenance and repair. Utilisation of these facilities in an optimum manner, has been presenting another challenge to the management of hospitals.

All these problems can be attended to well if the administrative machinery is effective. Here again, there are certain drawbacks in our administrative process itself which fails to achieve the ultimate objective. The major concern of administration is with the art of getting things done. A decision which does not result in action is meaningless, and yet, more and more attention in administration today is devoted to the problems and processes of planning and decision making, and less and less attention given to effective follow through. Consequently, those charged with follow through action find themselves unguided, unled and confused, and, therefore, fail to achieve the desired level of results. Thus, the weakness in the administrative structures and systems in a hospital add to the management problems.

In a modern hospital a team of doctors, nursing staff, para-medical personnel, social workers, catering officers, engineers and administrative staff having specialised training in various branches are working together to achieve the final objectives of the total hospital system. Many problems are no longer confined to a single hospital department. A choice of catering system may involve a catering officer, the engineer, the bacteriologist, the work study team and the cost accountant. Therefore, in order to appreciate the dimension of a problem it is necessary to examine, analyse and evaluate the system involved in its totality.

3.8.2 Land Marks of Efficiency of Hospital

The service (output) of a health centre is the outcome of the operation (functioning) of the various facilities of the health centre. 'Efficiency' of medical care applies to the work of the

service as a whole not the end itself but the way the end was achieved. It is rather concerned with the systematic efficiency of various facilities which put together contributes towards "quality of medical care" offered by hospital. "Adequacy" on the other hand, is concerned with the results achieved, in relation to the stated objectives. The outcome of health centre operation, which is service (medical care) can be evaluated in terms of:

a) The amount of work done — is it optimal, minimal or maximal;

b) The quality of work performed — how good is the service;

c) The cost of care of the patient and the cost of hospital operation;

d) The extent to which the patient is satisfied with the type of attention he had received.

A hospital presents most of the administrative problems of a factory, a hotel, as well as a college and social service. Administration of such a complex organisation is just not an art it has become a science which has to be learnt both by active formal study and experience. With formal training a good doctor can be very good administrator or a doctor. He cannot be both. It is difficult to play dual role. Therefore, knowledge of basic principles and techniques of management can have a tremendous impact upon its practice, clarifying and improving it.

During the recent years there has been a greater emphasis on organisational development, systems and procedures. Underlying this new approach is the idea that the internal functioning organisations must be consistent with the demand of organisation task, technology, people, structure, and the power regulating the course of action. Basically, this approach seems to be leading to the development of a 'contingency' theory of organisation. Management theory and science do not advocate the best way to do things in the light of every situation. Of course internal states and processes of the organisation are contingent upon external requirements and member needs. Therefore, effective management is always contingency or situational management.

Our aim in management of health centre is optimum utilisation of inputs for better output at minimum cost to the maximum satisfaction of consumers of facilities. How can we achieve this? This calls for introduction of "quality management system" in hospital, which includes study of organisational structure, responsibilities, procedures, activities, capabilities and resources that together aim to ensure that products, processes or services will satisfy stated or implied needs of the organisation. This in turn needs development of norms and standards of quality and quantity of medical care services. For planning purposes, it is necessary to establish the following norms:

a) The requirement of the community for medical care, covering out-patient care, supervision of follow up centres (the number of attendance per person per year), hospital care (the percentage of patients hospitalised).

b) Norms for attendance for treatment, the percentage of emergency admission, hospitalisation rate per person, number of patients treated per bed in a year.

c) Productivity norms, such as, the workload per hour of physicians in establishments of various types, the ratio of pathological requests per discharge, the specialist consultation rates, requests for X-ray examinations per patient or out patient and so on.

d) Norms of requirement of drugs and dressings.

In contrast "standards" are fixed arbitrarily. It covers indices relating to the resources required to meet the needs specified by the norms, i.e. indices relating to the availability of facilities for medical care, such as, standards of staffing, provision of beds and equipment. We may however, develop standards for average length of stay of patients, average bed occupancy, financial standards for various budgetary grants and so on. Therefore, for effective total quality management it is essential to develop norms and standards, an efficient management information system and a system of quality assurance in medical care.

UNIT 4 ROLE OF HOSPITAL ADMINISTRATION

Structure

4.0 OBJECTIVES

After going through this unit, you should be able to:

- describe the complexities and ambit of the roles of hospital administrator;
- list the various functions that a hospital administration performs in relation to the community;
- define the role of the hospital administrator that he performs for the hospital;
- explain the responsibilities of a hospital administrator towards the patients; and
- identify the attributes, qualities and skills required for a hospital administrator.

4.1 INTRODUCTION

In the previous units of this block you have learnt about the evolution and classification of the hospitals, hospital organisation and the role of hospitals. In this unit you shall learn about the role of hospital administrator.

UNIT 4 ROLE OF HOSPITAL ADMINISTRATION

Structure

4.0 OBJECTIVES

After going through this unit, you should be able to:

- describe the complexities and ambit of the roles of hospital administrator;
- list the various functions that a hospital administration performs in relation to the community;
- define the role of the hospital administrator that he performs for the hospital;
- explain the responsibilities of a hospital administrator towards the patients; and
- identify the attributes, qualities and skills required for a hospital administrator.

4.1 INTRODUCTION

In the previous units of this block you have learnt about the evolution and classification of the hospitals, hospital organisation and the role of hospitals. In this unit you shall learn about the role of hospital administrator.

If you have visited any hospital either as a patient or as a visitor you might have come across the various functionaries like the doctors, the nurses, the various paramedical personnel, house keeping staff and the like going about their assigned work in a hurried and professional manner. But rarely, if ever, you might have met a hospital administrator unless, of course, you specifically made it a point to meet him either to solve some of your problems or to seek certain information.

The hospital administrator basically works at the background to make things happen and to ensure that the hospital runs effectively and efficiently. At this point you must not go away with the impression that there is only one person as the hospital administrator managing the entire hospital all alone. In fact in a typical moderately large hospital there is a top administrator who is assisted by several assistants functioning at different levels in the hospital organisation. The role of the hospital administrator will vary depending upon the nature and complexity of the hospital. In this unit you will learn about the functions of a hospital administrator obtainable in most of the hospitals.

For a better understanding of these functions we shall subdivide the roles of a hospital administrator as role towards the patients, role towards the organisation, role towards the community and finally the attributes, quality and skill requirements of a hospital administrator.

4.2 ROLE TOWARDS PATIENTS

You have already learnt that a hospital performs promotive, preventive, curative and rehabilitative functions to a varying extent in relation to the health care delivery to the community, yet the primary reason for the hospital's existence is for the curative care. The patients are the sole reason for a hospital's establishment. A hospital, therefore, has to design its entire operational system centering round the patient. The hospital administration has to ensure that this objective of a hospital is achieved in its entirety.

4.2.1 Profile of a Hospital Patient

A patient is a person and a member of the society in need of medical care. He is not an object and not a disease entity. When he comes to the hospital he brings along with him all his emotions, all his need for individuality and his need of independence. A hospitalized patient is under great stress. The reasons for this stress are unfamiliarity with the hospital surroundings, loss of independence, separation from the family, financial problems, isolation from the people, lack of information, fear of death and, anxiety with the treatment modalities and the attitude of care givers.

Though it is expected that a nurse will give equal care to all patients and will not allow personal liking or disliking interfering with their professional duties but in actual practice this does not happen always. Patients who grumble or complain or demand more attention from the nurses usually become unpopular. Patients with physical defects, obesity, of foreign nationality and those patients who stay longer are also unpopular with the nurses.

The hospital administrator has a great responsibility to understand and appreciate these behavioural aspects of patient care and take appropriate measures to negate these dysfunctional aspects.

The hospital administrator also has to understand the specific needs of certain special group of patients so that those needs can be met. These groups are patients in wheel chair, elderly patients, paediatric patients, newborn babies and patients in intensive care units.

4.2.2 Creation of a Friendly Environment

In the previous sections we have tried to emphasize that a hospital is meant for the patients. Therefore, it is necessary that hospital administration must endeavour to make a patient feel welcome. The hospital surroundings and the environment are unfamiliar to the patients. Hospitals usually have imposing buildings, strict rules and procedures and expected norms of behaviour from the patients. The formidable and intimidating looking gadgets and usually glum faced non-communicative functionaries further enhance the alienation of the patients. Hospital administration has to recognize these and all necessary measures to make the hospital as friendly to the patients as possible.

4.2.3 Patient's Physical Needs

A hospitalized patient has very little control over his environment. Moreover, the disease process might have made him dependent on others for his physical needs. The needs which must be looked after by the hospital administration include physical comfort with proper and comfortable beds and environmental control with proper temperature, humidity and lighting, bathing, feeding, sanitation, mobility and so on. Control of noise and excessive glare from lighting needs to be looked into. Besides the physical comforts, needs for privacy and security also have to be given due importance. The needs of the individual patients vary and hospital administration should device the system in a manner that these needs of the individual patients are met.

4.2.4 Patient's Emotional Needs

A patient is usually under great emotional stress in hospital. Sadness, loneliness, uncertainty, fear, helplessness, despair all contribute to emotional stress of the patients. It is the duty of the hospital administration to recognize these aspects and do whatever is possible to reduce these stresses. All may not be controllable but at least their effects can be minimized by appropriate measures, policies and procedures, behaviour modification of functionaries, longer visiting hours and facilities of communication with their near and dear ones.

4.2.5 Patient's Clinical Needs

The primary reason of hospitalization of a patient is to get treated or to get certain diagnostic tests performed. The patients will always like to get these things done at the earliest without any delay. The hospital administration has to design the system in such a manner that this aspect of patients' needs is fulfilled. Procedures for admission, investigation, consultation, treatment and discharge must be streamlined in order to achieve this objective. Hospital bottlenecks which can interfere with quick disposal of patients needs to be identified and removed. Stock out of drugs and supplies needs to be controlled.

4.2.6 Patient's Satisfaction

You must be remembering that we have emphasized several times earlier that the very purpose of hospital's existence is for the patients. If there is no patient there will be no hospital. Therefore, it is in the interest of the hospital that the administrator must take all possible measures to obtain the greatest degree of patient satisfaction. For this purpose the hospital administrator has to identify various dissatisfies in the total service components delivered to the patient. The dissatisfies may be in the dietary services, may be in the behaviour of nurses or may be in the environmental condition of the hospital. Removal of the dissatisfiers may not immediately improve the satisfaction level of the patients. For this purpose the hospital administrator has to identify the items of services that positively improves the satisfaction level of the clientele. Patient satisfaction is an important indicator of quality of care being given to the patients. This is also necessary for survival and prosperity of the hospital.

4.2.7 Patient Education

The patients are usually lay persons. They are ignorant about the high technicalities of modern day medical science. They need to be educated regarding various aspects of the medical care given to them. This is necessary for better patient's compliance. Patient can participate better in the treatment process if they know why and how of the care being given to them. The hospital administration has to device means to seize all opportunities to educate the patients. For example a diabetic patient may need education regarding his diet, his way of life, necessity of regular checkups and so on. A young mother may have to be advised regarding the desirability and methods of breast-feeding. Hospital administrator has to provide facilities and take appropriate measures for training and motivation of hospital functionaries for achieving this objective. The hospital policy manual and medical staff bylaws also must incorporate these aspects.

4.3 ROLE TOWARDS ORGANISATION

The primary duty of hospital administration is to manage the hospital effectively and efficiently by utilization of resources placed under its command to achieve the hospital's objective. If you study the hospital organisational structure, the realization will immediately dawn upon you that the hospital is an extremely complex organisation. This complexity arises from the facts that there are a large number of professional groups functioning in a hospital with diversity of objectives. These groups take part in patient care, house keeping, maintenance services for building and equipment, dietary services, security, electronic data processing, hotel type of accommodation and varieties of investigations and procedures on patients. Because of diversity of objectives, there is a potential fertile ground for conflict. Effective coordination, clear enunciation of policies and procedures, delineation of functional boundaries and so on are necessary by the hospital administration. Unlike other organisation, a hospital deals with life and death situation and functions continuously round the clock with personnel whose skill and education levels vary widely. The hospital administration has to bring in unity among this diversity. A paradox in hospital

organisational structure is its duality of command in its many aspects. This is again a potential conflict situation that a hospital administrator is frequently called upon to resolve.

4.3.1 Strategic Planning and Management of the Hospital

During the last several years, the provisioning of health care delivery in India, is gradually shifting from the government sector to the private sector. This was necessitated by the forces of globalization, rapid technological changes, increasing customer expectation, demand for high quality care and increasing purchasing powers of certain sections of the clientele. More and more corporate houses are joining the fray of hospital business. As a result the competition is becoming intense and sometimes the survival of the hospital is also at stake. Thus, in response to this pressure, the hospital administration is becoming gradually professionalized. Strategic planning and management has become a necessity to circumvent the effects of the changes in the external environment of the hospital.

Strategy is the explicit, pro-active, long-range programme to achieve the hospital's objectives and thus accomplishing its mission. The strategic planning is concerned with laying down the objectives after situational appraisal of both external and internal environments, programme implementation, allocation of resources and control.

The top hospital administrative echelon is responsible for the strategic planning and its implementation in a hospital. The hospital administration has to identify the weaknesses, opportunities, threats and strengths of the hospital. This will lead to choice of a strategy, formulation and reformulation of objectives and orientation of hospital's resources to achieve them.

The steps that the hospital administration must take for strategic planning and implementation are as under:

- Formulation of objectives of the hospital
- Defining of present objectives and strategy
- Environmental appraisal to determine strengths and weaknesses of the hospital
- Finding out opportunities and threats
- Modifying the present strategy to bring it up to the desired level
- Implementation of the strategy
- Monitoring and control

4.3.2 Relating the Hospital to the External Environment

From your learning in the previous section you must have understood the importance of the influence of the external environment on strategic planning and management of a hospital. But what is external environment after all?

You may be able to appreciate that no organisation can work in a watertight compartment. It has to depend for many things on outside agencies. The role of any organisation is to obtain inputs from outside, process them and convert them into an output. The outputs can be either services or goods. The produce of the hospital is again utilized by the outside elements. The external environment, then, consists of those elements which directly or indirectly influences the functioning of the hospital.

The elements can be listed as under:

- Material supplies
- Manpower supplies
- Supply of finance
- Consumers
- Regulatory agencies
- Political groups
- Other similar organisations

- Press and other media
- Environmental Protection Activist
- Technology change
- Economic environment
- Social and cultural milieu
- Political, legal and ethical environment
- International environment

Some of these elements influence the organisation directly and some interact with the organisation in an indirect manner. The hospital administration has to take all these elements into account for their managerial activities of planning, organising, staffing and controlling. Any change in the external environment will have a direct or indirect bearing on the functioning of the hospital. The hospital administration might have to formulate their objectives and planning taking all these factors into account. To be effective, a hospital administrator has to anticipate the changes in the external environment by monitoring them on a day-to-day basis. He has to take pro-active action to circumvent negative impact of these changes and seize the opportunities offered by these changes. The hospital administrators can use the various forecasting techniques available to anticipate these changes. If the hospital administrator fails to respond to the changes in the external environment as they occur, their hospital may lose the ground to their competitors and may not remain viable.

4.3.3 Operational Management of the Hospital

The hospital administration has to run the hospital on a day to day basis to render patient care, which is the primary objective of the hospital, with the personnel, finance, accounts, technical and supportive services. In order to do this the hospital administration has to create a functional organisation that will be effective and efficient in order to achieve the hospital objective. The structure of the hospital need not follow any stereotyped fashion but must be responsive to the needs and demands of the situation. Expectation of the society, concepts, philosophies, accepted and time-tested principles must be taken into consideration and adapted to the prevailing environmental conditions to determine the organisational structure of the hospital. The organisational structure must also take into account the ethical aspects and standards that is expected of the hospital.

Many of the hospital's functions are repetitive in nature. The hospital administration must lay down certain directives to guide the various functionaries regarding the activities to be carried out by them. When to deal with a situation an employee must know, what he should do, how he should do it and what he ought to do or ought not to do. The hospital administrator has to carry out his day to day activities efficiently and effectively managing the hospital by laying down the policies, procedures and rules. We shall be explaining these terminology as under:

Policies : Everyone has to make some decisions big or small regarding his areas of activities. When faced with such a situation no body can sit down to undertake various steps necessary for a formal decision making. Policies are formulated to take care of such situations. Policies are general guidelines for decision making. In an organisation policy determines the perimeters within which the employees have to take their decision. It is the duty of top management to lay down the organisational policies. Policies contribute to effectiveness of the organisation. It can also help to avoid conflict situation.

Procedures: Procedures are customary way of doing things in an organisation. It guides the future activities. When some kind of functions occur repeatedly, it tells them how that activity will be performed. Sometimes this is also called standard operating procedures. It helps new employees to perform a particular function without much external assistance. This will also avoid variability in performance of a function and all functionaries can perform a particular job in a consistent manner. Essentially a procedure lays down the chronological sequence of an action.

Rules: This lays down the actions that must be done or must not be done in a given situation. When a rule is applied to a particular situation, there is no scope for discretion. Rules are usually very rigid in its interpretation and application. This absolves a lower level

employee from the burden of decision making and the consequences of a decision provided, of course, the rules are applied correctly to that particular situation. Rules are part of operational plan made by top level of hospital administration. It ensures conformity and accountability for the actions of the subordinate staff. The rules must be framed in a most explicit manner so that there is no ambiguity in its understanding.

4.3.4 Managing Hospital Staff

You might be impressed when you visit a modern hospital by its imposing buildings and the plethora of gadgets. But in spite of the highly technical environment of the hospital, human element still remains the sheet anchor of success of any hospital. A hospital employs a large number of people of different categories with widely varying educational and technical background. Some of them are highly skilled professionals while some others are of moderate education and without possession of any specific skill. This calls for a very efficient degree of personnel management.

Personnel management in essence involves the following elements of function by the hospital administration. You have already read about these in Course 1, Block 2 in detail. But are being mentioned here in brief for highlighting the role of hospital administration in there function.

a) **Manpower planning:** A hospital in order to grow and function effectively needs a supply of well-qualified and efficient employees in adequate numbers. Advance planning and actions are necessary for this purpose.

b) **Recruitment:** In order to have adequate supply of trained manpower, the hospital has to acquire these personnel through a process of recruitment. The hospital may not face any difficulty in recruiting highly trained people if its image is positive.

c) **Selection:** The process of selection involves mutual decision making on the part of the hospital as well as the candidate. This is not always an easy task. The hospital administration will always want to hire the best people. The process begins with an application form from the candidate. If there are a large number of applicants for a particular job, an initial screening interview may be held to short list the prospective candidates. Testing follows this. In this process the hospital administration tries to evaluate the candidates' skill level to determine whether these matches with the job specification. This will be followed by background investigation to check the genuineness of the applicant. Thereafter in-depth selection interview may be held or may be omitted. If the candidate is found suitable at this stage then he is subjected to a physical examination and finally if everything is alright, a job offer is made.

d) **Training:** The hospital is a knowledge-based organisation. A new recruit needs to be given induction training in which he is introduced to the job. Training is required to learn new techniques and concepts. Remedial training is most often necessary, if the employees are found to commit mistakes and the quality of their output is not up to the desired standard. Some retraining may have to be organized by the hospital administration, if some of the employees are displaced to another job so that they can be gainfully employed. For developing and employee and for his advancement, training has to be imparted.

e) **Performance Appraisal:** You will appreciate that in the interest of the hospital, the hospital administration will always like to know how well an employee is performing in his current job. The process of performance appraisal can determine this. The information obtained through performance appraisal can be utilized for determining the level of compensation, placement of the employee to a suitable job or for his advancement, or, in case he is performing poorly, for his discharge. Performance appraisal may also indicate the need for training and development. The hospital administration must very carefully determine the procedure of performance appraisal, because quite often it is a starting point of employee dissatisfaction. The methods used should be, as far as practicable, objective and without any bias.

f) **Grievance Procedure:** You shall agree that in any organisation employees will have occasionally some grievances. These usually have a snowballing effect and may degenerate into a major conflict situation between the management and the employees. It is, therefore, imperative that the hospital administration must install an appropriate, functional and active grievance procedure through which the employees can seek

redress of their grievances. Grievance procedure is a formal method mutually agreed upon by the management and the union. It is a step-by-step procedure that specifies the persons to whom the grievances can be referred and also the time limit for solving the referred grievance. It also indicates the way the grievance should be submitted to different stages of its handling.

g) **Discipline:** The hospital administration while recruiting people will try their best to recruit people who will be well disciplined. Yet there will be occasions when there will be a need to discipline employees. Self-discipline is the best discipline and it is an attitude of mind. The hospital administration should lay down rules and regulations that the employees can perceive as just and reasonable. In such cases the employees will usually follow them unhesitatingly. Though it is always best to avoid in discipline, yet some times it will be unavoidable. The penalties imposed should be commensurate with the degree of indiscipline. It is preferable to have increasingly severe awards of punishments each time a person is successively disciplined. The penalties can take the forms of oral warnings, written warnings, stoppage of increment in salary, withholding promotion if due, disciplinary layoff, demotion and finally discharge. The hospital administration must be very cautious while disciplining an employee. It should be immediate, with warning, consistent and impersonal.

h) **Wage and Salary Administration:** Hospital administration must make special endeavour for wage and salary administration. With a proper salary administration, the hospital will be able to recruit satisfactory employees. It is a motivational tool and it can reduce the incidence of personnel grievances. The hospital administration has to take appropriate measures for salary and wage administration, as it is the largest item of hospital cost. There are four closely related items of wage and salary administration. These are, wage and salary survey which will indicate the general pay level in similar organisations, job evaluation which will relate wages and jobs within the organisation, merit rating in which new employees start at a base salary and gradually progress to higher scales through merit rating and, lastly, incentives in which for a normal level of productivity the employees get a base level of salary and if the productivity is higher, the employees will get an incentive bonus. In corporate hospitals, most of the consultants are paid a percentage of the earnings from the patients treated by them. This is also an incentive scheme that motivates the consultants for higher productivity.

i) **Collective bargaining:** Hospital administration has to sit many times at the negotiating table with the representatives of the workers' union. Collective bargaining is an important process in industrial relation where the management and the union directly negotiate the terms and conditions of employment or working environment or any other issues affecting the employees. Collective bargaining is an important means of maintaining industrial peace. The management must recognize the rights of the union to negotiate and both the parties must have trust and confidence for each other. In this regard attitude of the management and the union towards each other is important.

4.3.5 Managing Hospital Materials

Materials cost almost fifty per cent of hospital budget. There are two types of cost: cost of materials and cost on materials. It is necessary for the hospital administration to reduce these costs. The scientific materials management techniques can address these aspects. Materials management involves as a single responsibility the systematic flow and control of materials from identification of need through customer delivery. Objective of materials management in a hospital is to render better service to the patients and improve profitability by reducing costs. Stock out of a vital drug may cost the life of a patient. This cost cannot be measured in monetary terms. The hospital administration, therefore, has an added responsibility in comparison to other organisations for efficient management of materials in a hospital. The materials management functions include:

a) Developing specification for materials

b) Materials planning and programming

c) Procuring materials through centralized purchasing

d) Receiving

e) Distribution

f) Inventory control

g) Storage and preservation

h) Transportation

i) Materials handling

j) Disposal of scrap and obsolete materials, equipment and surplus material.

The hospital administration has to lay down various policies and procedures for purchasing, distribution and disposal. Prevention of theft and loss of material are important managerial functions. The hospital administration must take measures to reduce these menaces. Thefts can be in the form of manipulating various records. Laying down appropriate policies and procedures can reduce these.

4.3.6 Managing Hospital Finance

Hospital financial management is an important area of functioning of hospital administration. For this purpose various tools and techniques are available to the hospital administration. The first step in the financial control process is the programming. Programming is the process of deciding on the nature and size of the programme that are to be undertaken in order to achieve the hospital's goal. The most widely known programming system in non-profit organisation is PPBS – Planning – Programming – Budgeting System. The tool that can be used to evaluate a programme is Benefit/Cost Analysis. The other tools that are used for financial management are various kinds of budgets – Capital Budget, Cash Budget, Operating Budget etc.

The financial management control process involves two further activities: control of operations and measurement of output. In the activity of control of operations, control is exercised on spending, on adding personnel or spending on material. The financial control is to see that the organisation achieves its stated objectives. In the output measure, three aspects are seen. These are results measure that is a measure of output expressed in terms that are related to the hospital's objectives, productivity measure and social indicators.

The hospital administrator should be able to understand various financial statements like a balance sheet, profit and loss account and so on. The hospital must constantly monitor the financial health of the hospital in order to ensure its survivability. For this purpose various tools are used which are basically determination of ratios. Some of these are: Operating margin (price level adjusted) ratio, Non-operating revenue ratio, Return on equity, Liquidity ratio, Long-term debt to equity, Total asset turnover, Days in patient account receivable and so on.

4.3.7 Managing Hospital Information

Information is an essential ingredient of decision making. Information is necessary at various levels to function effectively. Hospital administration has to design an information system that can deliver quality information which is timely and accurate. The essential functions to be included in the hospital information system are Medical functions, Administrative functions and Financial functions.

These three broad functional areas can further be subdivided into several levels. These are:

a) Transaction Processing. Examples are: order entry of drugs, diet, linen, census, patient billing, inventory control, treatment scheduling for operation theatre, physiotherapy, special procedures and so on.

b) Control Function. Examples are: medical care evaluation, occupancy and patient mix, surveillance of hospital infection, cost control

c) Operational Planning. These may include: staff education, patient care planning, discharge planning, purchase plans, budgeting.

d) Strategic Planning. Examples are: services to be offered, levels and sophistication of patient care to be planned, hospital image improvement plan.

In the management of information one of the most important aspect to be looked into by the hospital administration is the medical records department. This is the most important source of hospital information.

4.3.8 Maintaining Relationship with the Medical Staff

The hospital administration has to maintain a cordial relationship with the medical staff. The objective of both the groups is that of rendering better patient care. The medical staff directly delivers the patient care whereas the hospital administration provides the facilities and resources for this purpose. Both the groups must work within an environment of mutual trust respect and confidence.

However, occasionally, some problem does arise. These are mainly due to misunderstanding due primarily to poor communication. The hospital administration has to keep the medical staff informed about the organisational policies and changes whenever these occur. The situation in which both the groups function has a potential for conflict. The medical staff is concerned for the patients and for their own economic interest. The administration is concerned for the entire hospital, the employees and the economic health of the hospital. However, the medical staff who understands the reasons for the policy changes will be more appreciative of the constraints of the hospital administration and will be more supportive. The hospital administration, therefore, must freely and frankly communicate with the medical staff, listen to their problems patiently and sincerely try to solve them. If there is no apparent solution immediately available, then that fact must be explained to the medical staff. The medical staff regards the administration as problem solver, as provider of resources, as catalytic agents, as facilitators and holds them responsible and accountable for any deficiency in these functions. You will appreciate that as the medical staff is the agency through which the medical care is delivered a harmonious relationship has to be maintained with them by the hospital administration.

4.3.9 Maintaining Relationship with the Public

A hospital is a community institution. For its survival it needs support from the community. It is necessary for the hospital administration to know the needs, demands and aspiration of the public. Hospital also has to constantly endeavour to inform the public that what it is doing for them and they should expect from the hospital. Essentially, management of relationship with the public has four primary aspects. These are:

a) To know about public desires and aspirations

b) Educating the public about what it should desire

c) Arranging satisfactory contact between public and the hospital and

d) Informing the public about what the hospital is doing

The top hospital administration has to take it upon themselves, the public relation activities as one of their primary responsibilities. It should be undertaken as a planned process and as an on going activity.

4.3.10 Risk Management of the Hospital

If you open a newspaper in the morning, quite often you may come across news item pertaining to hospital. These may be consisting of reports regarding death of a patient due to negligence on the part of the hospital, damage to the hospital property due to vandalism by the public, hospital having been asked to pay huge compensation to a patient by a consumer forum. There may be other kind of damage to the hospital property by fire or flood or any by other natural calamity.

Like any other organisation a hospital is also exposed to many kinds of risks. In a hospital there is an added element of patients. Due to increased awareness of the public, the hospitals many times find themselves in an embarrassing situation due to certain faults in their functioning. Hospital administration, therefore, must take all measures, firstly, to avoid risk and then to minimize the effects of the risks. The hospital administration must have a very positive outlook towards the risk management. This positive attitude will percolate to the supervisory staff and down to the lower level employees. Security and safety consciousness then can be ensured.

4.3.11 Managing Ethics and Code of Conduct

Ethical behaviour is necessary throughout the medical practice. Though most of the tenets of ethical practice are outside the preview of law, the guiding principle is welfare of the patients. It is basically a self-imposed responsibility of the medical profession. The hospital

administration has to maintain an ethical environment in the hospital so that patient's interests are served. The hospital administration has to lay down appropriate rules, regulations, policies and procedures for every one to follow. The broad areas that need to be looked into are: Consent of the patient to disclose information, Right to information of patients, Ethical relation of a doctor with other doctors and so on. All doctors know the source of medical ethics originated in the Hippocratic oath. Besides these, ethical codes govern the experiment and research involving human subjects. Helsinki declaration, in which most of the nations including India are signatory, lays down the conditions and procedure to conduct such research.

4.3.12 Managing Legal and Statutory Responsibilities

Since independence various legislations have been enacted by the parliament in India to govern the functioning of the health care institutions. Even before independence many such legislations were in force. These legislations cover a wide range of topics including health, manpower, disease control, family health, reproduction, mental health, food safety, control, manufacture and safety of drugs, transplantation of human organ, pollution control and disposal of biomedical waste. The sources of these controlling legislations are as under:

a) Constitution of India (1950)

b) Indian Penal Code (1860)

c) Medical Council Act (1956)

d) Consumer Protection Act (1986)

e) Transplantation of Human Organ Act (1994)

f) Biomedical Wastes (Management & Handling) Rules (1998)

It is mandatory that the hospitals function within the boundaries of these acts. Hospital administration has a duty to lay down the provisions of this legislation in the policy and procedure manual of the hospital. In addition, hospital administration has to train the functionaries about these laws so that no violation occurs. Moreover, they have to install a monitoring mechanism to watch for any probable breach and take remedial measures before they occur.

4.3.13 Managing Marketing Responsibilities

Marketing means that a party receives something of value from another party in exchange of something of value. In health services a patient receives medical care for which he pays a charge. This payment may be paid directly by him or indirectly by another agency.

Today's hospital function in a competitive environment. Competition has a positive impact on health care delivery system. It helps in reducing cost; services will be more efficient and provides some impetus to improve quality.

You might recall that in an earlier section we have discussed strategic planning and management of hospitals to achieve hospitals mission. Marketing audit helps the hospital administration in diagnosing the external environment and then formulating objectives for implementation.

The marketing responsibility though may be entrusted to the marketing department manned by personnel with marketing background or the responsibility may be given to an outside consultant, yet the top management has the responsibility for planning, development and implementation of marketing activities.

Marketing involves management of four factors essential to the delivery of health care. These are:

a) Product: The range, variety, sophistication and level of services to be offered is the product.

b) Place: How and where the services will be offered – hours, outpatient, inpatient or domiciliary services.

c) Price: This includes the price paid by the patient either directly or indirectly or this may include other intangible costs the patients incur.

d) Promotion: This is the mechanism of making the patient aware of the services offered by the hospital and also involves aspects to create an interest in him to use the services whenever needed by him or by his friends.

Thus effective marketing strategy will ensure proper utilization of the hospital's facilities and maintain its competitiveness.

4.3.14 Quality Management of the Hospital Services

Hospital administration is duty bound to provide high quality services to their clientele. This can be achieved through a programme of total quality management and continuous quality improvement. This is an all-pervading function involving employees, their training, development, and motivation. Customer focus is the prime requirement for this quality management programme. Leadership and commitment of the top hospital management to this cause is essential for this programme to succeed. The hospital administration has to take an active part in and be a driving force for the programme. The quality management is a planned and continuous activity for an organisation. The top management must fully support actively the quality management programme. It should not degenerate into a lip service and genuine interest, active support and participation by the top management of the hospital will be necessary.

4.4 ROLE TOWARDS COMMUNITY

If you recall the definition of a hospital as provided by the World Health Organisation, it will be immediately clear to you that a hospital besides being a medical organisation is also a social institution. A hospital is meant to serve the health needs of the community in which it is located. A hospital is a part of total health care delivery system providing comprehensive health care. A large number of people and their families get directly or indirectly involved with the hospital physically, emotionally and financially either as a patient, as a supplier of goods and services or simply may be as visitors. A hospital must be able to fulfil the needs and aspiration of people. The hospital administration has to fulfil this obligation and responsibility in shaping the hospital as a truly community hospital by orienting its services towards that end.

4.4.1 Obtaining Community Participation

In order to fulfil its role effectively full community participation is essential. Without active support from the community no hospital can survive. The hospital needs moral and financial support from the community to be able to discharge its duties properly. The hospital administration has to inform the community about this need. The hospital administration has to take a positive interest in the improvement of the community pertaining to health related issues. His support and leadership towards this cause is quite necessary.

4.4.2 Integrating the Hospital with other Health Care Institutions

Health of the community cannot be viewed as fragmented efforts being undertaken by the various agencies. Health care delivery is a continuum in which hospital occupies a very prominent and most visible part. In a community there will be other health care institutions, public health laboratories, private practitioners and others. A hospital occupies a pivotal position and has a leadership role to perform. It is the responsibility of the hospital administration to integrate the services of these isolated agencies and coordinate their efforts for providing a comprehensive and need based health care with universal coverage, accessibility and affordability.

4.4.3 Supporting Primary Care

Primary care is the method by which health need of the community can be met to a large extent. Primary care is basically provided mostly by the community based health care institutions other than the hospital. But without the active support of the hospital primary care cannot succeed. Hospital is a repository of all state of the art medical knowledge. Hospital can provide necessary expertise to the other care providing organisations. Hospital can also guide and direct these institutions regarding the best way to deliver medical care. The hospital administration, apart from providing the technical expertise, can also support primary care activity of other institutions by looking after their need of manpower, equipment and supplies.

4.4.4 Providing Extramural Services

We may again recall the role of hospital as enunciated by the World Health Organisation in which the world body while defining the hospital has mentioned that the services of the hospital reach out to the community in their home environment. In fulfilling this commitment the hospitals do hold various kinds of medical camps. Eye camps organised by the hospitals are common examples. In addition to these medical camps, the hospital can organise domiciliary care, immunization camps and the like. The hospital must have a positive outlook towards these extramural services so that necessary resources can be provided for these purposes.

4.5 ATTRIBUTES, QUALITY AND SKILLS OF A HOSPITAL ADMINISTRATOR

Hospital administration is a challenging profession. By now you must have appreciated the formidable and diverse functions that a hospital administrator is called upon to perform. A typical hospital administrator in India is a medical graduate with a postgraduate degree in hospital administration. Currently about six medical institutions are offering doctoral courses, which is at par with any other postgraduate medical qualification and is recognized by the Medical Council of India. In addition, many management and other institutions are also offering postgraduate courses for graduates from all other streams. The All India Council of Technical Education recognizes these courses. In some countries, particularly in USA, a hospital administrator is typically a non-medical person. According to Dr. J. R. McGibony, Hospital Consultant, this was due primarily to the shortage of doctors. The training involves inclusion of subject matters like social-behavioural and management sciences, public health, principles of medical care and application of administrative concepts and skills in health care organisations. Whatever be the feeder channel for the profession of hospital administration, certain attributes are necessary for efficient performance of their job. These are: a successful past record of efficient and effective management, ability to direct the subordinates to achieve the organisational objectives, a high degree of conceptual skills, mental robustness, plenty of tact and ability to withstand adverse criticism. The most important skills are summarized as under:

a) **Leadership skills:** A hospital administrator must have leadership skill. He should be able to influence people to act with zeal and enthusiasm to achieve organisational goal.

b) **Interpersonal skills:** Hospital is a labour-intensive organisation. A congenial environment is conducive of productivity, satisfaction and happiness. A hospital administrator must have good interpersonal skill to create such an environment. At the core of interpersonal relationship is communication and empathy.

c) **Conflict management skills:** In an organisation like a hospital where diversity of objectives is the norms, quite often conflict situation arises. It is argued that a certain level of conflict is essential for any organisation to remain vibrant, dynamic and responsive. This is functional conflict and can be utilized by managers to the benefit of the organisation. A hospital administrator must be able to manage conflict well and should not allow it to become dysfunctional.

d) **Negotiating skill:** A hospital administrator is called upon to negotiate quite often on various matters pertaining to his organisation. Negotiation means a process in which two or more parties exchange goods or services and to arrive at a common meeting point. It has to be carried out in an atmosphere of cordiality and at the end both the parties must have a feeling of winning. In a hospital negotiation is required to be done with the suppliers of various materials. A collective bargaining is also a form of negotiation between the management and the workers union.

4.6 LET US SUM UP

In this unit you have learnt about the role of a hospital administrator and his attributes, qualities and skill requirement.

You have learnt that in his role towards patient the hospital administrator should have a better understanding of the patients. He should create a friendly atmosphere where patients feel welcome. His role towards patient also includes looking after the physical, emotional and clinical needs of the patients.

You have also learnt about the role of hospital administration towards the organisation. He has to lead the hospital towards the future long-term goal of the hospital to serve its mission and ensure its survival and competitiveness. This is done through strategic management techniques.

In the day-to-day operational management of the hospital, he has to manage the resources of the hospital to produce a high quality medical care service. The resource the hospital administrator has to manage includes personnel, materials, finance and information.

His other routine job includes public relation activities, maintaining relationship with medical staff, risk management, marketing management and maintaining an ethical environment. He also has to abide by the various statutory and legal provisions for functioning of the hospital. Total quality management and continuous quality improvement calls for a commitment from the top level of hospital administration on an on going basis.

You have also learnt that hospital is a community organisation and a hospital administrator has to ensure community participation that is necessary for moral and financial support of the hospital. In his role towards community, supporting primary care and provisioning of extramural services calls for a positive attitude on his part.

Towards the end you have learnt that a hospital administrator has to have attributes of a highly skilled professional qualification and good past track record. The major skills required are leadership skill, interpersonal skill, conflict resolution skill and negotiating skill.

4.7 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) a) Creation of a friendly environment

b) Looking after patients' physical needs.

c) Looking after patients' emotional needs

d) Looking after patients' clinical needs

e) Obtaining patient satisfaction

f) Patient education

2) a) Dietary services

b) Behaviour of nurses

c) Environmental condition of the hospital

3) Physical comfort with proper and comfortable beds, environmental control with temperature, humidity and lighting. Other physical needs include arrangement for bathing, feeding and sanitation.

4) a) Unfamiliarity with hospital surroundings

b) Loss of independence

c) Separation from family

d) Financial problems

e) Isolation from the people

f) Lack of information

g) Fear of death and

h) Anxiety with the treatment modalities and attitude of the care givers.

Check Your Progress 2

1) a) Formulation of objectives

b) Defining present objectives and strategy

c) Environmental appraisal to determine strengths and weaknesses of the hospital

d) Finding out opportunities and threats

e) Modifying the present strategy to bring it up to the desired level

f) Implementation of the strategy

g) Monitoring and control

2) a) Manpower planning

b) Recruitment

c) Selection

d) Training

e) Performance appraisal

f) Grievance procedure

g) Discipline

h) Salary and wage administration

i) Collective bargaining

3) a) Managing hospital employees

b) Managing hospital's materials

c) Managing hospital finance

d) Managing hospital information

e) Maintaining relationship with the medical staff

f) Maintaining relationship with public

g) Hospital risk management

h) Managing ethics and code of conduct

i) Managing legal and statutory responsibilities

j) Managing marketing responsibilities

k) Quality management of the hospital services

4) a) Product

b) Place

c) Price

d) Promotion

Check Your Progress 3

1) The hospital orients its services keeping the community need, demand and aspiration in mind. A positive interest towards improvement of community health on the part of the hospital administrator helps achieving community participation. Integration of services of all the other heath institutions providing health care of only some aspects of total health care of the community is essential. The hospital needs to support the primary care activities. Lastly, the hospital provides various extramural services.

2) The hospital supports primary care activities by providing leadership, expertise, material and personnel resources.

Check Your Progress 4

1) Hospital administrator should be a man of experience with a post graduate degree or diploma in hospital administration. The hospital administrator should possess a high degree of conceptual skill, mental robustness, tact and ability to withstand frequent adverse criticism.

2) a) Leadership skills

b) Interpersonal skill

c) Conflict resolution skills

d) Negotiating Skills

UNIT 1 PRESENT HOSPITAL SCENARIO: MANAGEMENT ORIENTATION

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- make an assessment of the overall status of hospitals in India;
- identify the problem areas in hospitals;
- list the cause and effect relationship of the problem; and
- identify the remedial measures as a manager.

1.1 INTRODUCTION

In Block 1 of this course you have been acquainted with the overview of hospital system which dealt with evolution of hospitals, hospital organisation and its role, and the role of hospital administration.

During the course of your studies you must have learnt about the classification of hospitals, the roles of present day hospitals and the roles played by the administration. You must have also observed that the hospitals are a highly complex social, economic and scientific organisations whose main function is to provide comprehensive health care to the society and to act as a referral system within the infrastructure of the hospital system in the locality or region.

With the increase in the awareness in the technological advancement pertaining to diagnostic and therapeutic aspects of medical care there is an increasing demand and expectation of the people for better, comprehensive and quality medical care. The question arises as to how the different types of hospitals are functioning and to what extent they are able to meet the expectations of the people? What problems and challenges the hospitals are facing to provide medical care at optimum cost and how best the challenges could be met to provide optimum quality care at optimum cost to the maximum number of people?

In this unit you will learn about the present hospital scenario as perceived by the

consumers of medical care. Further you will learn about the challenges perceived by the administrators and the factors responsible for the present status of various health establishments. You will also learn about the steps required to be taken to improve the quality of care at optimum cost to the best satisfaction of people.

1.2 PRESENT HOSPITAL SCENARIO

1.2.1 Resources Available

While studying the evolution of hospitals in our country you have learnt that after independence in 1951 there were 2014 hospitals with 106,478 beds in the country. The bed: population ratio was 0.30 per 1000. Subsequently more and more hospitals were created and present bed:population ratio is about 0.7 per 1000. But majority of the facilities were created in urban areas. Presently there are 15037 hospitals with almost 6.24 lakh beds, out of which 4621 hospitals are in rural areas and 10,416 in urban areas (CBHI, 1996). It is clear from above that 70 per cent of the hospitals are available for 30 per cent of urban population while 70 per cent of rural population has to manage with 30 per cent of hospital facilities. The ownership status of medical institutions as on 1.1.1996 is given below:

Ownership	Hospitals	
	Number	Beds
Government	4473	375987
Local Bodies	335	19677
Voluntary and Private	10289	228155
Total	15097	623819*

* As on 1.1.96 information collected from states.

It will be seen that government owns 29.6% of the hospitals with 60.4 per cent beds. The local bodies have 3.1 per cent beds, the voluntary and private bodies constitute 68.1 per cent of the hospital but the number of beds is 36.5 per cent only.

1.2.2 Present Status of Medical Care

Even after 50 years of independence, we find that our social sector has miserably failed to meet the peoples growing expectations for the services. Although there has been substantial manifold increase in the number of primary health centres, community health centres, hospitals and the hospital beds during the successive plan periods of 50 years, one still finds that all these achievements have been neutralised due to population explosion on the one hand and the increase in awareness and demand for quality care by the population on the other.

Voluntary and private bodies have been encouraged by the government to augment the facilities. In addition, industries provide health care services to their employees individually and through employees state insurance scheme. However, 70 per cent of hospital beds provided by Government, Voluntary Organisation and Private bodies are located in urban areas. It has created regional imbalance not only in the setting of hospital services but also in the distribution and availability of trained medical manpower in the rural as well as urban areas.

In spite of appreciating the gap in demand and supply of medical care facilities the government and medical fraternity have hardly made any attempt to consolidate the gains in resources, over the years, by judicial use of existing facilities; as a result the people are disillusioned and discontented leading to numerous complaints through press and consumers forums of the country.

1.3 THE MALADIES: CAUSE AND EFFECT RELATIONSHIP

1.3.1 The Maladies

Over the last decade there has been increasing number of press reports highlighting the deplorable state of public and private hospitals and nursing homes. Extracts of some of those are mentioned below:

- Public hospitals turn into illness factories. For millions of Indians, going to a hospital remains a nightmarish experience; big crowds, long queues, confusing maze—like layout, incomprehensible instructions, tedious procedures, casual diagnosis, rough handling by sullen staff, rude physicians, bribe-taking by touts, complete absence of accountability and unjustified delays. Such a state of affairs personify just one aspect—negligence, callousness, incompetence and lack of care—a state of crisis prevailing in the health care system of the country. It further states that the public hospitals are themselves victims of policies which give low priority to health, starve the medical system of funds, place low emphasis on primary health as opposed to specialized care, keep the system grossly understaffed by poorly paid junior doctors and nurses, neglect maintenance, create extreme overcrowding and ensure that the whole system goes to seed.

- As regards the private hospitals and nursing homes another press report mentions in the headline, "Shrine to Mammon Private Hospitals offer no Solution". Referring to a committee report of health experts (1992) appointed by Municipal Corporation of Greater Bombay on city's nursing homes, the survey found the following deficiencies:

  As per survey reports on nursing homes in other cities like Delhi, Calcutta, Patna, Lucknow, Bangalore the findings were generally the same with some variations. In Delhi for instance it has been reported that out of estimated 2000 private nursing homes, over 1500 are unlicensed.

- The rural health infrastructure consisting of about 2622 community health centres and more than 22000 primary health centres (1997-98 report) also suffer from various maladies like, lack of suitable accommodation, inadequate staff, insufficient diagnostic and therapeutic facilities like equipment, drug etc. In some cases laboratory, X-ray and OT facilities although available are not utilised due to lack of manpower. As a result there is constant flow of patients from periphery towards district and city hospitals.

- Even in city like Delhi the peripheral zonal hospitals are either understaffed or ill-equipped—resulting in flow of patients towards larger hospitals leaving the small hospital under utilised.

- In recent times the blood bank services came under scrutiny. A.F. Ferguson and Co., a management consultancy firm made startling revelations in its report (1995).
  - — Out of 1010 blood banks then existing in the country 616 were unlicensed.
  - — One-forth of the blood used in various hospitals was drawn from the licensed commercial blood banks.
  - — The donors, mostly undernourished poor people, were not medically examined before bleeding. Around 4000 to 5000 regular professional donors were accepted for donation in as many as 20 cities.
  - — Existence of middlemen and the nexus between doctors and the blood banks was established.
  - — The statutory AID Surveillance centres were not in operation and up to 85% of blood collected was not screened for the HIV virus.
  - — Lack of storage facilities and the blood banks were in most unhygienic environment.
- Majority substandard, most of them being housed in tiny flat lets (e.g. 200 sq. feet).
- A seventh of them in sheds or lofts in slums.
- 77 per cent do not have scrubbing rooms.
- Less than third has qualified nurses.
- Some have operation theatres as small as 48 sq.feet.
- Some do not disinfect the OT more than once a week, some once in 3 days.
- Non incinerate infectious waste material, instead dump it in municipal bins, from where scavenger pick out needles, syringes for recycling.
- Some claim to be maternity homes but only a third have labour room.
- 37.5 per cent of all wards and 50 per cent of beds are dirty, most are poorly lit.
- The heaviest costs are incurred in unnecessary investigations.
- Large number of high priced private hospitals and nursing homes do not have intensive care units or facilities for critical care in emergencies

These press reports will give you a fair idea of the prevailing maladies in the existing system.

1.3.2 Cause and Effect Relationship

Hospital is a composite medical and social organisation providing medical care services while acting and interacting with several variables like task, technology, structure, people and power. These five variables are interdependent and any change in one of these variables will cause or effect change in the other variables. The 'People' is considered as the most important and vital variable in the organisation. The hospital system constantly interacts with people in the process of delivery of medical care, such as, patients and community, medical staff, para medical and nursing staff, and the higher authorities. To appreciate the problem it is necessary to examine the roles played by the 'people' in the hospital system.

Patients

While medical care services and technology are advancing the public awareness is also increasing to generate demands for benefits of new technologies. Patient is vitally interested not only in the availability of care but in its quality and low cost as well. He demands personalised care, and free access to information concerning their illness and likely progress, and emotional support. He assumes the hospital authority is responsible for providing quality medical and nursing care, safety and comfort to the patients.

Providers of Care

The hospital administration has to create a working environment providing suitable structural facilities, like building space, staff, beds, equipment, services within the reach of all categories of staff in time and space. Staff should be suitably motivated and trained, and adequate policy, rules and procedures should be available for conflict resolution, industrial harmony and well co-ordinated activities.

Organisers of Care

The owner has moral and legal responsibility to ensure that the interest of each patient is protected and appropriate measures are taken to monitor and improve quality of care and patient safety. In the process he is also interested to maintain productivity by optimizing cost of care.

1.3.3 Problems and Constraints

After highlighting the above roles of the people in hospital system an attempt is being made to examine the cause and effect relationship of the maladies prevailing at macro-level and micro-level.

Health is a State Subject

Health being a state subject, every state has its own pattern of delivery of medical care and there is no uniformity in policies and programmes.

Hierarchy of Need

Health has always been allotted a low priority. It occupies sixth place in the order of priority for budgetary allocation. Thus the monetary resources are and have always been a constraint in the health sector.

Health is Treated as Expenditure and Not an Investment

Unlike the Railways, Commerce or Industry where the allocation of funds is regarded as an investment because they are revenue generating sectors, the medical services are considered to be an expenditure, since no profit motive is involved. However, it should be realised that healthy people means a healthy nation. Fifty per cent of the population is devoid of even minimum required health facilities, because of this negative approach towards health.

Lack of Intersectoral Approach

Good health of community depends upon various factors like basic sanitation, safe drinking water, balanced diet and health education. These require a well co-ordinated and integrated approach amongst the various sectors. Lack of co-ordination at various levels has resulted in high mortality and morbidity rates in the country leading to uncontrolled situation prevailing in hospitals.

Lack of Leadership in Health Field

With the introduction of newer medical technologies in diagnostic and therapeutic services the cost of medical care has become very expensive, and has created an imbalance in demand and supply. In order to meet this challenge there is a need for dynamic leadership. One of the causes of malfunctioning of hospital services is the lack of appropriate leadership not only at the apex levels but also at the middle levels.

Lack of Norms and Standards

Countrywide public and private sector medical establishments are organised without proper

planning considerations as there are no nationally accepted norms and standards. There is no uniform guidelines for construction of buildings, organisation structure, staffing, equipping or standards for performance. Except certain hospitals in organised sectors like Railways, Defence and some newly construct corporate sector, none of the hospitals meet the modern management needs for medical care.

Philosophy of Mammon

Certain industrialists and rich people have found hospital as a profitable industry, and therefore there is mushroom growth of private hospitals, nursing homes, polyclinics in all urban and semi-urban areas. These establishment are purely profit oriented, and are not guided by any state/national norms and standards for performance and they are thriving in spite of glaring inadequacies in facilities provided by them.

Consumer Awareness

The patients and the community are generally aware that the health care is a basic human need and right. They have right to good medical care. The enlightened urban and semi urban population are also aware that medical practitioners, like other professionals, were liable under the Consumer Protection Act (CPA) 1986. This will definitely solve glaring cases of neglect and callousness. However, simultaneously the community should be aware of the genuine limitations of the medical care facilities available, to avoid frivolous and vexatious complaints.

At microlevel there are many extra-mural and intra-mural factors which are directly or indirectly responsible for the maladies in the hospital system.

Extra-mural Factors

- Inadequate and irrational allocation of funds
- Failure of the policy of regionalisation system of medical care forcing patients to crowd in larger hospitals leaving smaller hospitals underutilised.
- Political and bureaucratic apathy and at times interference in hospital management.
- Absence of norms and standards and regulatory mechanism for establishment and functioning of all types of hospitals/nursing homes.
- Lack of professional training as no system of compulsory training for upgrading/update for medical, technical and administrative staff exists.

Intra-mural Factors

- Inadequate manpower, material and financial resources, leading to gap in demand and supply.
- Poor utilisation of resources available due to inefficient professional and administrative staff – Lack of motivation, misuse and pilferage of materials.
- Costs and financing of operation: Poor budgetary planning and control.
- Sharing of power, unionism, conflict between administrative and medical staff.
- Inefficient machinery for handling grievances, patient complains and staff conflicts.
- Inadequate inservice/on the job training for technical and paramedical staff causing inefficiency and lack of involvement.
- Inadequate policy, rules, standing procedures for activities, and non-existence of regulatory mechanism.

1.4 MANAGEMENT OF HOSPITALS: CHALLENGES AND STRATEGIES

1.4.1 Management Dimensions

While studying the role of administrator in the previous block you must have noted that hospital administrator is the executive leader required to manage an organised group of people from different educational background, engaged in a specific task of providing medical care in a hospital. His function demands interaction with the:

- patients
- medical staff
- paramedical and other personnel
- higher authorities
- community, i.e., the dependent population who utilise the hospital, other hospitals and medical institutions in the area, the political leaders and so on.

Today the modern hospital administrator has to strike a balance between internal operational activities and outside activities. Administrators are always under pressure to keep up with changing times. They must develop new skills and apply old skills to new situations. In present situation an administrator has to give more emphasis on organisational planning and development, efficient operation, cost containment, increase in productivity and marketing. To discharge these functions efficiently and effectively he needs the following :

- Well **motivated** adequately **trained manpower** in a suitably **structured organisation,** with **empowerment**.
- Hospital system design specifications and procedures for efficient delivery of medical care services.
- Budget planning, monitoring and control, towards cost containment.
- Optimum utilisation of resources to increase productivity.
- Community education on hospital matters affecting them.

The above activities in turn will improve and maintain public image of the hospital.

1.4.2 Challenges and Strategies

Some areas in which hospital effectiveness is being questioned and the role of administrator is under stress, include:

a) Organisation structure
b) Technology management
c) Manpower utilisation
d) Sharing of power in decision-making
e) Patient care—quality management
f) Cost and financing of operations
g) Leadership and motivation
h) Information technology
i) Marketing of hospital services

Hospital Organisation

No two hospitals are alike—this will be reflected in the organisational structure. The ideas and outlook of management, the type of services, and the relative skill of personnel, will all have a bearing on the structure of the organisation.

Due to various factors in a government department the organisation structure tends to become unrelated to the goals of the organisation and the administrators freedom to organise is seriously curtailed. Organisation structure is expected to provide a sound framework for management, however, the present structure is identified as a stumbling block and it has become necessary to reorganise to achieve clarity of responsibility, and accountability.

There is centralisation of authority, generally remote from the point where tasks are performed. Authority is vested to a position without clear accountability. For example, the administrators have little control over staffing, and in the selection of people who constitute their work group.

Due to increased specialisation, changing technology, and increased expectations of consumers and employees the hospitals require better co-ordination and organisational adaptability. The administrator's expertise is that of an integrator structuring the perceptions among producers, and between producers and consumers, so that change can be effected without destroying organisational integration.

Therefore, there is a need for an organisational structure and a system for performance of various activities, which can be regulated through process control methods.

Technology Management

Technology management is posing a great challenge to hospital management. The continuous process of technological advancement, particularly in the field of diagnostic and therapeutic services, often lead to conflicting situations between the health care providers and the expectations of the community. The cost benefit analysis of technology by the hospital management in terms of hospital size, location, morbidity status of population, budget, mission and management of the technology in terms of quality improvement is critical to the hospital's success. Hospitals desire to update technology to be competitive among the health care organisations should always be weighed with the benefit to the organisation and the improvement of quality of care for the community.

Manpower Utilisation

Hospital is a labour-intensive organisation. Human resources with adequate level of

education and skill when properly motivated to work with zeal and confidence can only achieve good results. The reasons for poor capacity utilisation are:

- Outdated recruitment rules, specifying education and experience standards not commensurate with present day requirement.
- Lack of organised on the job training and inservice training for growth and development.
- Departmental policy, rules and procedures, and the duties and responsibilities for each grade are not specified resulting in overlapping of functions.
- Poor motivation due to poor managerial leadership.
- Unsuitable organisation climate conflicts, no grievance procedure, lack of facilities, reward or punishment.

Therefore, there is a need for a good executive leadership to attend to personnel management for optimum capacity utilisation and to prevent frequent turnover of trained manpower.

Sharing of Power

There are multiple line of authorities in the complex, modern hospital. A delicate balance of power exists which is frequently shifting. Authority lines can be considered as checks and balances within the organisation. Power is synonymous with exercising influence and control over a situation; it is that force when used causes a change.

Hospital governing body is responsible for monitoring the quality of care rendered in the hospital by the medical staff. The medical staff has the overall responsibility for the quality of medical care provided to patients. The hospital administrator has to ensure availability of resources required for medical care and efficient operation of different departments directly or indirectly providing medical care services. Hospital is, therefore a functional organisation with three lines of authority. The administrator should empower his subordinates through the following methods:

a) Delegation of authority to take decisions
b) Involvement of employees at all levels of decision making process
c) Provide resources —men, materials, finance, system design, rules and procedures
d) Provide developmental opportunities
e) Trust employees
f) Sharing information
g) Recognition and rewards
h) Empowerment of teams.

The need for empowerment for willing co-operation and performance of tasks cannot be over emphasized. This will help in process control and in determining causes of success or failure.

Patient Care

The quality of care refers to the degree of excellence of the medical care delivered—whether it meets or exceeds the accepted standards. However, the criteria necessarily changes with improved efficiency related to technological advancement. It is a moral as well as legal responsibility of the owner of the hospital to ensure that the interest of the patient is safeguarded and appropriate measures are taken to monitor and improve quality and patient safety at reasonable cost to the satisfaction of the patient.

The measurement of quality of service poses many problems, as it is not possible to establish accurate standards of judgement. Yet we need to have some means of evaluating the service, for, only then the efficiency of performance and in turn the community benefit, can be assessed.

The medical care service quality evaluation programme should be so designed that the adequacy of the structure, the process of medical care delivery and the impact on the beneficiaries can be assessed in quantitative and qualitative terms and correlated with cost of care.

Cost and Financing Operations

In our hospitals there is a perpetual problem of scarcity of resources. The cost of manpower and material resources, and the cost of operation of facilities have increased manifold. Therefore, it is essential that all those who are engaged in hospital activities and not only in hospital management must be made responsible for reducing/controlling cost of operation of activities. Responsibility of such nature cannot be imposed, but it has to be introduced in a manner acceptable to the people.

Therefore, working out an acceptable cost containment strategy for hospitals is a problem requiring urgent attention.

Leadership and Motivation

The administration of modern hospital has become a demanding profession because of increasing complexity. There is an urgent need for high quality management of our hospitals as in any other industry. A fully trained hospital administrator can only ensure optimum and economic utilisation of resources, prevent underuse/overuse of facilities, standardise hospital rules and procedures, collect data for evaluation of performance. The hospital administrator should pursue the twin aims of efficiency and effectiveness.

The deficiency of trained administrators particularly for larger hospital is posing a problem in management of hospital.

Information Technology

Scientific management is recognised as the key to the success of an enterprise. By now you know that the management is the effective use of human, financial and material resources to achieve the organisational objective through the managerial functions of planning, organising, staffing, leading and controlling. Information system is the most vital for performing all managerial functions as it provides required information to each level of management, at the right time, in the right form and the right place, so that decisions are made efficiently and effectively.

The framework of hospital information system should be so organised that there is a rapid and regular feedback of information. A vast amount of information is available in the hospital to enable an objective assessment of the hospital service and to compare the performance of one hospital with that of another. The main problem is the collection, compilation and presentation of the basic statistical facts in a more acceptable and digestible form.

Therefore, the system of collection and presentation of "Hospital Operational Statistics" and "Hospital Morbidity Statistics" should be standardised.

Marketing of Hospital Services

Marketing has since been recognised as one of the core activities in the hospital management, particularly in private hospitals. Hospitals which concentrate on treatment of diseases are gradually under going a change to health management. Marketing should not only stop at bringing in patients but also be extended to develop a permanent image within the minds of people by building lasting relationship.

With the health insurance gaining importance and the recent proposal by the government to privatise health insurance a new challenge is faced in marketing hospital service.

The hospital administrator should now be familiar with health insurance policies, diseases covered, cost of adopting the scheme, reimbursement policies and attracting potential customers, and also to take care of a patient within the stipulated period and cost.

1.5 REMEDIAL MEASURES

The causes of malady as enumerated above are multidimensional and therefore, remedy depends on situational analysis and problem identification followed by appropriate steps for selection of best solutions out of the alternatives. However, broadly the general remedial measures are mentioned below:

- Reduce overcrowding in district/city/referral hospitals by enforcing regionalisation system. Simultaneously improve the functioning e.g. PHCs, CHCs and other small and medium size hospitals by providing adequate staff and facilities, and adequate supervision and control.
- Introduce norms and standards for provision of resources, and for performance through strict quality control procedures to ensure accountability.
- Development of all categories of staff through organised training and motivation, and provide suitable organisational structure and climate for efficient functioning, and provide incentives to highly skilled and efficient staff to prevent turnover.
- Introduction of information technology for hospital performance statistics which can benefit management of hospitals in periodical evaluation of activities, both professional and administrative, to ensure optimum quality and quantity of care provided at reasonable cost. Information technology can be used for cost containment programmes and comparing performance of similar hospitals.
- Government should lay more emphasis on:

  —people below poverty line

  —rural and semi-urban population health needs

  —people covered under insurance schemes

  —aging population

  —emergency care

  —comprehensive therapeutic system of medicine by integrating allopathic and Indian systems of medicine at all levels.

- Encourage private sector to establish hospitals and function under suitable regulation to provide optimum care at low cost.
- Appointment of trained hospital administrators, particularly for medium or large size hospitals, to act as an executive leader in management of complex modern hospitals of today.

.....

.....

1.6 LET US SUM UP

In this unit you have learnt that our hospitals all over the country present a dismal picture as reflected in various press reports and complaints received by consumer forums and also the maladies are all pervading from PHC level to the tertiary city hospitals. The gap between demand and supply is increasing with introduction of new technology and rising cost of medical care.

You have also learnt about the cause and effect relationship of the prevailing maladies at macro-level, micro-level and some general remedial measures.

It has been however, emphasised that the challenge has to be met by judicial and economic use of resources, by training and motivation of staff, cost containment programmes, introduction of norms and standards for resources and performance, and above all, enforcing a regulatory mechanism through concurrent performance evaluation, to ensure that failures or success is made accountable.

Present day hospital is a very complex organisation. The quality of service provided to the patient by hospital employees is the foundation of good hospital community relations. There are many constraints and challenges in the management of hospitals and in today's scenario the administrator is under tremendous pressure.

UNIT 2 PUBLIC RELATION AND IMAGE OF HOSPITAL

Structure

2.0 OBJECTIVES

After studying this unit, you would be able to:

- describe the concept of public relation;
- identify the factors affecting public relation;
- able to set up a Public Relation Department; and
- recognise the different types of conflict and describe how decisions are made or prescribe how the conflicts should be resolved in the capacity of a manager.

2.1 INTRODUCTION

You will agree that public relation is a part of every day life. The fact that you have taken up the course of hospital management or have opted for medical graduation indicates that you are going to interact with people whom you do not know, but you would like to impress them and help them. This activity is public relation.

Very often when we discuss about some successful persons, we say that he is impressive and has good public relations. As a person has his own public relation, so is true of an organisation which has its own public relation. In today's world of globalization and the paradigm shift of people's opinion and expectation, with the rise in competition, the role of public relation has become all the more important. In this unit you will learn the factors influencing public relations and the principles of PR in hospitals. You will also learn about the factors responsible for patient satisfaction, courses of conflict in hospitals and how to resolve them.

2.2 CONCEPT OF PUBLIC RELATION

Think about your family and try to make out who in your family is doing the job of public relation (though unconsciously) for your family. You will agree to that the best example of public relation in a family is mother who alone can maintain the mutual understanding between the father and children. It is she who maintains or conveys each other's requirements or feelings and thus helps to keep the family united. She has the full and detailed knowledge about the neighbours, their family members, from where they belong and even their likes or dislikes. Whenever a guest is to visit the family, she only decorates the home and serves the guest so as to create a good impression of the family. In a similar way the public relation department projects the hospital or organisation and maintains good relation with the society.

UNIT 2 PUBLIC RELATION AND IMAGE OF HOSPITAL

Structure

- identify the factors affecting public relation;
- able to set up a Public Relation Department; and
- recognise the different types of conflict and describe how decisions are made or prescribe how the conflicts should be resolved in the capacity of a manager.

2.1 INTRODUCTION

You will agree that public relation is a part of every day life. The fact that you have taken up the course of hospital management or have opted for medical graduation indicates that you are going to interact with people whom you do not know, but you would like to impress them and help them. This activity is public relation.

Very often when we discuss about some successful persons, we say that he is impressive and has good public relations. As a person has his own public relation, so is true of an organisation which has its own public relation. In today's world of globalization and the paradigm shift of people's opinion and expectation, with the rise in competition, the role of public relation has become all the more important. In this unit you will learn the factors influencing public relations and the principles of PR in hospitals. You will also learn about the factors responsible for patient satisfaction, courses of conflict in hospitals and how to resolve them.

2.2 CONCEPT OF PUBLIC RELATION

Think about your family and try to make out who in your family is doing the job of public relation (though unconsciously) for your family. You will agree to that the best example of public relation in a family is mother who alone can maintain the mutual understanding between the father and children. It is she who maintains or conveys each other's requirements or feelings and thus helps to keep the family united. She has the full and detailed knowledge about the neighbours, their family members, from where they belong and even their likes or dislikes. Whenever a guest is to visit the family, she only decorates the home and serves the guest so as to create a good impression of the family. In a similar way the public relation department projects the hospital or organisation and maintains good relation with the society.

The term is often used interchangeably with information, communication, public affairs, propaganda, adversity. It is used as noun e.g. how is your public relations; and as a verb — the situation was public relation or as a modification, it was public relation's accomplishment.

Prof. E.J. Robinson of Boston University has described public relation as an applied social and behavioural science. It is that function, which measures, evaluates and interprets the attitudes of various relevant publics. The fundamental purpose of public relations' practice is to establish a two-way flow of communication for mutual understanding, based on truth, knowledge and full information.

Public Relation as per dictionary means presenting a good image of an organisation to the public especially by distributing information.

Public Relation is a combination of science and art. It uses various scientific principles and methods to deal with the public, to use statistical and other methods to conduct survey and to assess the opinion of individual or groups and then arrive at a particular decision. Public relation has a close association with anthropology, psychology, sociology and economics. Anthropology helps in studying mankind, taking into consideration their origins, beliefs, customs, etc. For a good public relation, one must have a thorough knowledge of psychology so that he could deal successfully while dealing with mass, as people's behaviour is closely related to his/her psycho. If one could not feel or measure this process of mind, particularly of a group, the situation would become chaotic and of utter confusion. Even for motivation, one needs to understand the basic psychology. By now you are aware that hospital is a social organisation. You will also appreciate that institutions like hospital exists only because of society and is judged only by its contribution to society as viewed by the society. Sociology the study of human interaction and interrelations, their conditions and consequences, helps to understand the view and needs of the society and therefore modify its policies and services in accordance to social needs. There are several factors, which affect public relations and are being described here for your understanding.

1) **Attitude**

   It is the way of thinking or behaving. Attitude is the emotional feeling towards something. In other words it is the public opinion (opinion is an expression of an attitude). One's self interest determines his/her attitude. It may be inherited or acquired from the society to which one belongs. For example people of French origin would have some common attitude. On the other hand the same French people living in a different community/society for a long time would have a little different attitude. It is very important for persons dealing with public relation to understand the attitude of people with whom they are dealing.

2) **Education**

   The education of the public is a very important factor. The more educated a person is, the more self-respect he would have, and he would like to be treated more as an individual rather than a group. He would never tolerate authoritarianism. The mode of tools to be adopted would depend very much upon the education of the public.

3) **Socio-economy**

   The expectation and satisfaction of peoples is influenced to a great degree by their socio-economic status. For the same treatment facility, people from different societies would have different expectations. For example a person from government sector who knows that delays occur everywhere would tolerate long queues, whereas a person from a multinational firm, having a busy schedule will not tolerate long waiting time and instead would seek prior appointment even if he has to pay a little more.

Besides the application of the sciences, the public relation is an art. Unlike factory, where one feeds the input and recovers the output, all in a straight-line process; public relation has to tune according to the needs of the people. Although the aim of successful PR is to satisfy customers, but the type of customer with whom they are dealing matters much, more so when a person is in a diseased state or accompanying a diseased person who may not behave like a gentle man makes one to think about the strategy of PR. When a person fall ill, most of the time, it is not he who decides, but it is the family members or even neighbour

who decide and affects the choice of hospital. Even when the patient has arrived in the hospital, the satisfaction of patient as well as of attendants are important for good public relation. Thus, you would appreciate that successful PR is based on scientific theory followed artfully.

2.3 PRINCIPLES OF PUBLIC RELATION IN HOSPITALS

You shall acknowledge that the ways to attract 'a' customer for goods e.g. a cosmetic soap is different than the ways to attract a patient for the hospital. The strategy to be adopted for PR in a hospital has to be based on the following principles:

1) The most important requisite for a good public relation is efficient and good hospital service meeting the expectations of the patient and the attendants as well as those of visitors coming to the hospital.
2) The hospital services should adapt its services according to the needs of the population it is serving. The needs of the patients could be determined by periodically surveying patients' opinion, expectations and analysing them through scientific means and accordingly tailoring the services.
3) The members of the governing body or top decision-makers should be alert, sensitive and responsive to the needs of their clients.
4) All hospital works should be interpreted in such a way that it appeals to the public and are informed on logical and rational grounds.
5) These rational appeals should be given a thrust accommodating the emotional and personal needs of the people involved.
6) The attitude should be such that criticism and rational resistance are not suppressed nor attempts are made to overpower them. Rather they should be welcomed and answered honestly.
7) Hospital publicity and promotional methods should be planned according to the internal developments and constraints, both in terms of resources and functioning of the hospital.
8) All publicity should be honest, dignified, factual and entirely applicable. They should not be exaggerated and should not have adverse effect on other similar institutions.
9) Public relation programmes should keep in mind the vision or aim of the hospital and also realising that it is the public who are paying the bills of the hospital and therefore their interests should always be protected.
10) Hospital functions should always be updated of the recent trends in public and adopt or publish accordingly. For example if the talk of the town is about health insurance, then the public relation department should publicize more about their policy towards insurance rather than speak about national programmes.

Activity 1

You had been assigned to visit public sector company say NTPC and had been assigned to make a presentation to the various categories of employees in their auditorium. Describe what would be the information that you would like to have and how would you make the presentation. Again your hospital is asked to make a presentation at a primary school. In what way your presentation would be different from that you had earlier made at the said PSU.

.....

.....

.....

.....

.....

2.4 PUBLIC RELATION DEPARTMENT

By this time you must defend that it is the people who matters most and they must be made to fully understand the hospital, the vision of hospital, the services available and the results of these services. People who do not understand these cannot be expected to appreciate them, nor can they be expected to take full advantage of the services being provided unless they know that they are available. Here comes the role of the public relation. On the other hand, the administrators should also be aware of the need and expectations of the public as per the feed back of the public relation department and accordingly take policy decisions.

Stages for the Development of PR Programmes

There are three stages for development of PR programmes for an organisation:

1) First is to define the objectives for increasing public understanding and acceptance of the organisation products, plans, policies and personnel.
2) Second is to equate these objectives with the interest, need and expectations of various relevant public groups.
3) Third is to develop, execute and evaluate a programmes to earn public understanding and acceptance.

Therefore, public relation programmes is a two-way communication system between hospital and public with inputs and acceptance leading to action from both the sides.

The Responsibility and Functions of Public Relation Officer (PRO) of a Hospital

There should ideally be a separate PR Department headed by a full time public relation officer with MBA qualification or advanced diploma in public relation or journalism with an experience a PR. He/She is to have a team of 3-4 PRO's and few social worker/guide and a secretarial staff with an independent office. In smaller hospital, they are amalgamated with personnel department or marketing department. The department should report to the Hospital Administrator. Their works would involve the following:

1) To understand the vision and objective of the institution, and to have it documented in a way that it can be presented to the public.
2) Working with other departmental heads — both clinical and support, to maintain good relation between the hospital and public and contribute to mutual understanding.
3) To conduct opinion surveys among present and former patients and thus be aware of the current state of opinion and their experiences of the hospital and constantly alerting the administrator of the outcome of such surveys.
4) Attending to the complaints and comments from the patients, visitors and relatives, trying to sort out the problems, and whenever their wish cannot be met or are unjustified, explaining the complainant the reasons thereof.

5) Maintaining close contact with various prominent community members who have interest in hospital and have the capacity to alter public view.

6) Maintaining close liaison with other hospitals particularly those who are referring the patients. To inform them about the patients as soon as they are admitted, and keeping good contact with community welfare organisations like Lions Club, Rotary Club, Blood Bank etc.

7) Maintaining close contact with peoples concerned with mass media like press, radio, television etc. To prepare press release or announcements for the administrator or spokesperson. To assist reporters by providing relevant and accurate information.

8) To make sure that all suggestions and complaints sent by post are duly acknowledged and to send an acknowledgement letter or action taken, signed by Chief PRO or hospital administrator.

9) To answer queries by persons or companies related to treatment, diagnosis insurance bills etc.

10) To supervise all the departments which are important from PR point of view, like that of reception and enquiry, registration, OPDs during peak hours, OT waiting area, ICU waiting area etc.

11) To arrange various meetings, conferences or workshops. To attend to visiting dignitaries, team visits to hospital and preparing materials to be delivered by eminent physician or surgeon for some important public presentation.

12) To arrange exhibition where the main objective is to educate the public of the progress in medical care and diagnostic methods and to motivate the people to use the updated facilities available in the hospital. These exhibitions are tailored keeping in view the people to whom they are addressed. For example, exhibition in an industry would stress more on screening workers for early diagnosis of silicosis, cancer etc. and availability of health check up facility whereas for a low socio-economic group, the stress would be more on communicable diseases and dietary advises.

13) To arrange for pamphlets, booklets, manuals etc. for the patients. These booklets are in general of two types:

   a) Booklets to be distributed among the patients which welcomes new visitors to the hospital preferably having an introduction by the administrator. It contains all the relevant information, regulations specialties and diagnostic or screening facilities available, the charges of various facilities e.g. room rents, package deals etc. and rules/regulations of the hospital like visiting hours, meal timings etc.

   b) Booklets or manuals for the in-house staff about the various procedures, job description of staff, facilities to staff, do's and don'ts, whom to contact in particular situations etc.

14) To publish house journals which address to all sections of staff and help create common identity among staff members from senior most to down the line staff. It normally includes:

   a) News which are national, regional and local.

   b) Feature articles by the staff member and includes medical as well as non-medical articles like case studies and essays etc.

   c) News related to personnel e.g on newcomers, retirements, promotions, awardees etc.

   d) Information from management to staff.

   e) Letter from readers, patients, companies etc.

   f) Job vacancies, advertisements, and future plans/events. News pertaining to staff association and trade unions.

The house journals serve a very important role to augment coordination, and offer an excellent opportunity to clear any doubts or stop grapevine communication. It also serves to let off steam before it explodes.

The PRO has to make arrangements so that each and every staff members receive a copy of the magazine/journal. It may also be sent by post to various organisations on

panel, to patients who are frequently visiting the hospital so that they also feel a sense of belongingness to the hospital.

Check Your Progress 1

1) You are the CEO of a big hospital and you require a person to head the PRO department. What would be the basic qualification and experience you would look for ?

.....

.....

2) You are going to publish a house journal. The introduction of the journal should start with which one of the following :

   a) Future plans of hospitals

   b) Existing facilities available and staff distribution

   c) Vision/mission of the hospital

   d) Recent accomplishment of the hospital

3) You have received a suggestion by post from one of your valued patient. What would be your immediate reaction?

.....

.....

2.5 PATIENT'S EXPECTATION AND SATISFACTION

In a study of psychological aspects of patients visiting a hospital, Ernest Diehter revealed that a patient while entering into a health care system becomes emotionally like a child. He adopts the hospital as a step family, but is usually opposed by the hospital's attitudes and practices. In general he avoids obligations which may exaggerate his physical illness, but also accepts the idea that he needs help, he desires to get well and need technical competent help in getting well.

Patient in general expects the followings in any hospital:

- The services being provided should be efficient without much waiting time for registration, consultation, investigations, treatment and discharge.
- Patients try to avoid crowds, and would prefer appointment system rather than standing in a long queue.
- They want no discrimination to be made between individuals of different social status or between patient and hospital staff.
- They always expect someone to guide them while they are waiting for the hospital facilities e.g. at registration, OPD block, investigations etc.
- They expect comfortable environment with proper sitting arrangements, clean toilets, room to be ready to receive in-patients and other physical facilities like canteen, drinking water supply etc.
- Every type of consultation, investigation and other services to be available under the same roof in an organised way so that there is little confusion and less movement or delay.

Role of Other Staff in PR

Besides the public relation department other staff also plays an important role for building up of the image of hospital. A patient who has undergone some treatment in a hospital, projects the hospital to his peer group and evolves an image of the hospital in the society. In a study conducted in a tertiary care hospital to find out the source of awareness of the

hospital among the patients, it was found that more than half of the patients selected that particular hospital as per the advise of their peer groups who themselves or their relatives at some point of time in the past, had the good experience of the hospital. Therefore, it is the patient who creates the image of the hospital, both good and bad. It is said that a satisfied patient would bring in ten more patients but a dissatisfied one would prevent double the number from visiting a hospital.

Therefore, the responsibility of building up the image of the hospital falls on the satisfied patient, which is turn, depends on their experiences when they are availing some of the services of the hospital. The quality of experience would depend upon all the staff members with whom he/she had an interaction and the procedural system through which they had to undergo while receiving medical care. However the Public Relation Department organises and facilitates the process so as to deviate the impression in favour of the hospital. However, the aim of everyone in the hospital is a satisfied patient. The role of various staff members in the context of public relation and the image of the hospital are as under:

Doctor

It is the doctor who matters the most to the patient. If the patient is satisfied with the doctor, he tends to forget and forgive all the bad experiences. Traditionally medical profession has had the image of active medical personnel and passive patient. Medical professionals prefer to deal impersonally with problems rather than people because of the prestige of the medical profession and its high esteem. In general, the role behaviour of doctors in ward settings is divided into four types—the humanitarian, the professionals, the bureaucrats and misfits. In an American Hospital Study, it was found that most patients expect kindness, understanding, sympathy, interest and encouragement from the doctors rather than intelligence, knowledge, skill and training of the doctor.

There are three basic models of the doctor-patient relationship:

a) **Active-passive:** In this model, the doctor is active and the patient is passive, as seen in an emergency situation, serious injuries, coma etc. The patient behaves like an infant who is helpless and the doctor behaves like a parent. The patient cannot ask any question and he has to abide by the doctor's wishes.

b) **Guidance-cooperation:** In this model as is seen in acute disorders, the patient is aware of what is going on, can reply to the questions of the doctor and is capable of following the guidance as given by the doctor. The patient behaves like an adolescent and the doctor like parent.

c) **Mutual Participation:** In this case the doctor helps the patient to help himself as in chronic disorders or an ambulatory patient. The understanding and judgement of the patient is as important as of the doctor.

Nurse

Nursing care is probably the second most important factor, if not the first for which a patient comes to the hospital, particularly for the inpatients, and thus contributes in a major way for better public relations in hospital. However, as against earlier days, when nurses were seen as an angel of mercy, the image is being replaced by less angelic and considerably more mercyful. As in the case of doctors, with increasing technical skill and more demands, they also have become more supervising and less sensitive to the suffering with more mechanical approach. This shift of attitude can be demonstrated by the fact that still today, most students enter nursing profession because of traditional concept of tender loving care to individual patients, but over the course of their nursing education in the present system their attitude changes. Even unionism, which was never thought of to affect the nursing services, are nowadays very common in this profession also. A patient most often expects affection and caring from the nurses. As discussed earlier, a person when he becomes ill, behaves like a child and for him the nurse is like a mother or own sister. However, it is not uncommon for the attendants of patients more often, the young males passing indecent comments on the nurses, this may be one of the reason for the change of attitude. In a study it was revealed that nurse patient interaction was the highest (about 60%) of total staff patient interaction. However, about half of the patients reported that nurses were unkind to them. Even nurses confessed that whenever the patients or attendants annoyed them, they used to snub them. They find disciplining patients is more easier and less time consuming than calm discussion.

In spite of the constraints and recent trends, in a study conducted at a premier institute revealed that more than three-fourth of patients were satisfied with the performance of the nurses. The PR department can arrange crash courses or workshops to help the nurses develop their interpersonal and communication skills and help them to understand how their behaviour can affect the impression of the hospital on a patient. They should be made to understand that it is the nurses with whom the patients most often interacts and therefore whatever impression they gather by the nurses' response are carried away with them and dissipated to the public.

Para and Non-medical Personnel

This group encompasses all those except doctor and nurses working in the hospital. Thus, it includes technicians, administrative personnel, ambulance drivers, nursing aides, sanitary and engineering workers etc. Most of them, except nursing aide and sanitary workers, are not required frequently to interact with patients.

However, one study found that more than half of this category of employees used harsh words whenever patients or his relatives did anything knowingly or unknowingly against their wishes. Their influence usually are more on rural illiterate patients who are from adjoining areas and who consider this group of employees to be superior to them. On the other hand, inspite of these people's more closeness to illiterate rural people; they pay more attention and attend to services more frequently to such patients who tipped them and those who are urban and literate.

Sensitive Areas of a Hospital in the Perspective of Public Relations and Image of the Hospital

i) **Reception and Enquiry Office:** The central reception area is the first point of contact of the patient with the hospital. The reputation of the hospital could be made or marred by response of this important department. Persons working here should be courteous, showing concern for the visitors and should have full knowledge of the routine procedures of the hospital. They are to be trained to remain cool and tactfully answer all the queries of the patient. During the peak hours additional staff may be posted and are to be supervised personally by the Chief PRO. Every effort to be made to attend to waiting patients and no patients should be allowed to wait for want of someone's help, as a waiting sick patient who is confused at the central lobby of the hospital creates a bad impression to other patients. The areas to be equipped with adequate number of telephones sets, on line computer and have an attractive and appealing environment.

ii) **Registration and Billing Counter:** These are basically located in the central lobby adjacent to Reception and Enquiry Office. The staff should be prompt, courteous, cheerful and efficient wearing the official uniform. As with other staff, they should display their identity cards or name plates. It has been observed that the practice of displaying the identity of the staff makes them alert of their behaviour to avoid any complaints specific to them. It is the first point of contact for such patients who have determined to avoid the services of the hospital and therefore to be treated in a more cautious way?

iii) **Emergency Service Department:** Public relation is very important in this department as the patients visiting here are serious or consider themselves serious and demands prompt attention. Other attendants, who are emotionally charged, usually accompany them. Even a minor incidence of delay or misbehaviour could flare up the situation. Therefore, persons manning the station should be mature enough with good organising capability so as to initiate prompt, courteous treatment as well as explaining the accompanying persons.

iv) **Out Patient Department:** OPDs are also known as the shop windows of the hospital. More than two-third of all patients attending the hospital avail the OPD services. About three-fourth of all admissions and investigations are through OPD. Therefore the manner is which the services are provided goes a long way in creating the image of the hospital. The staff posted at OPD should be courteous, prompt and disciplined and more so punctual. Waiting in the OPD for consultation is very frequent and most hated, but is unavoidable. Therefore mechanisms to distract them and make the waiting period comfortable should be made like provision of good sitting arrangements, tea or coffee vendor near the area, closed circuit TV showing interested but educating film or soft music background. If feasible, appointment system may be incorporated. Adequate

number of trolleys and wheelchairs with attendants are to be provided. The major source of revenue collection depends on the OPD services, from consultation, investigation or even admission. Therefore, in addition to image of hospital from the economics point of view too, this area is very important for the hospital.

v) Other areas like lift, staircase, ICU waiting areas and the nursing counter are also very important from the point of view of public relation.

Activity 2

1) You would like to start an orientation programme for the staff for better PR of hospital. Which category of staff would you choose to begin with?

   a) Doctors

   b) Nurses

   c) Para medical staff

2) What are the issues you would like to stress more upon while preparing a protocol for patients in emergency, which would be different from ambulatory patients. (Please include protocols to be followed by doctors, nurses, reception and billing department with emphasis on zero waiting time.)

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

Hospital and Press

The following are the ways by which information can be communicated to the press.

a) **Person to Person Contact:** In this case, the Chief PRO or Hospital Administrator is acquainted to a particular reporter or person from press. Because of their long association or they may be the patient of a renowned doctor who is also an administrator, the press gets the information from the person at a one to one meeting and publishes their regular columns in newspaper.

b) **Press Conference:** Press conference is organised by the PR department like any other meeting. Journalists from different agencies are called and made comfortable to receive some announcements followed by handouts in the form of news release. Due preparations are needed before calling press conference. The presence of director and concerned physician and patients is required. As journalists are very busy people, it is always wise to give precise information and be ready for any probing question from the journalists.

c) **Press Reception:** This is very similar to social parties where after the reception and initial refreshments, there is a brief meeting followed by final refreshments.

d) **Meet the Press:** As against press conference and press briefings where all the

arrangements are made by the hospital in meet the press programmes the arrangement are made by associations like Press Clubs, and the distinguished guest from the organisation is called on. This is usually done for some dignitary who happens to represent the hospital for some renowned or breakthrough works.

The following is advisable for the PR person who is maintaining the relation with press:

1) The matters, which are more of public interest and not the organisation, should be given due regard and to be more stressed.

2) Present with confidence, supported by factual data.

3) If the PRO does not want something to be quoted, he/she should avoid talking off the record or in personal terms to the journalists. Otherwise the unwanted information may be published without revealing the source and thus causing more damage to the image of the hospital.

4) The information should be precise and true even if it hurts the administrator.

5) Start with the most important facts.

6) Never argue with reporters even if they are hurting the PRO. The reporter may try to probe a particular incident on his own assumption, and the PRO should be ready to answer the entire probable questions supported by facts and figures.

Managing a PR Programme

As in any programme the basic principles of management viz. Planning, Organising, Implementing and Evaluating may be applied for public relation also.

1) **Planning Programme**: A PR programme has to be planned in detail, so that it serves the basic purpose of making something to happen. It aims to take the full advantage of a situation. The process starts on the following line:

   a) Specifying a problem or set an objective.

   b) Chalking out the various options available to achieve the objectives.

   c) Selecting the best option, taking into consideration the cost involved and the magnitude of return.

   d) Selection of suitable media.

   e) Application of the programme which should be continuous and target specific.

2) **Organising**: Before implementing the programme all available resources in terms of money, manpower and media (3 M's of PR) to be taken into account. The PR department has to decide in association with the administrator, whether the plan could be implemented through the organisations own department or external agencies are to be involved. If other agencies were to be involved, they would need proper briefing with clear understanding of the objectives.

3) **Implementation**: The task of implementing a programme, more so if it is to be communicated to the vast population is a Herculean task. One can never expect to influence all people at the same time, no matter how extensive their resources are. It is therefore important that at one time, a particular segment of the population can be made the target and in a phasewise, but in a continuous process, the programme can be implemented.

4) **Evaluation**: It is very difficult to measure the PR activities in quantitative terms as no mathematical formula can be applied. Here number of press releases, number of advertisements, exhibitions or meetings arranged, may be the mode of PR, but the achievement has to be determined by the degree of impact a given message has produced on the target population and their reactions to it. However, some indirect assessments may also be done, e.g. by evaluating the increase in number of patients related to the programme excluding the other factors, number of companies/ organisations empanelled etc.

However, the patient is the best judge and evaluator of the service and would provide the actual information, and about the image of the hospital as is seen by them. To obtain their

perception, opinion polls or surveys may be carried out by questionnaire or interview. It is recommended to approach the patient according to their convenience and not vice-versa. Patients may not express their view while still availing the services of the hospital because of the fear that if they reveal something against any one directly related to their medical care, it may be taken very seriously by the staff to whom it is directed and they may even retaliate. It is therefore advisable to carry out the interview when the patient is about to leave the hospital. There are many advantages of the procedure—popularly known as exit interview viz.

- The patients are free to express their opinion, complaints or suggestions at the time of exit from the hospital.
- At the time of leaving they have passed through all the procedures or regulations and thus have a better idea of the hospital and therefore can judge the services in a wider perspective.

2.6 CONFLICTS

You will agree to that the most difficult task for a public relation department or any person in the managerial capacity is to face conflict and to resolve it. However newcomers in the managerial positions fear it most. Therefore, it is imperative for you to have a brief idea of conflict.

You will agree to that conflict is an inevitable part of life, be it in personal life or organisational life. At times the manager or administrator has to take decisions which may not be favourable to all people, and the people within the organisation may stand against the decision and create a conflict like situation. In a hospital like organisation which are engaged with public dealings, conflicts are not infrequent.

Nature of Conflict

It is very difficult to classify conflict, as depending on the situation, they differ from each other, whereas to some extent, they have certain things is common. However, there are two extremes of the spectrum of conflict:

1) **Competitive Conflict**: These types of conflicts are of competitive in nature and may be made use of as a good opportunity. Here two parties are involved who strive to achieve a single goal. The emphasis of both the parties is to win the situation rather that to defeat each other. At the end of the competition, there is an obvious result and one party wins. The example of such type of conflict may be seen when two departments or two teams of the same department are given certain set goals, e.g. to perform certain number of operations per day by a certain deadline. Now, both the parties follow the set rules and procedures and strive to achieve the goal, with occasional conflict between them, which are brought to the administrator. Not much exercise is required to solve these problems, but both parties know that for the administrator, it is the given target that is important. However at the end, one party wins, but both party improves and none is defeated.

2) **Disruptive Conflict**: Here the parties involved does not follow any set rules or behaviour (which was followed in competitive type) and the aim is to defeat or reduce the other party. The most common example of such type of conflict is the complaint of attendant of a patient about the misbehaviour of a staff. One would try to put allegations against other and would try to defeat each other. If the matter is not solved at the early stage, they would keep on shouting on the top of their voice and would try to disrupt the normal functioning of the hospital. In the late stage, the conflict ends with separation or some sort of assertions and ultimately no one wins. Therefore, in this type of conflict, there is always a negative attitude, and the end result is not clear.

It would be worth to mention that by nature no conflicts, including the above examples are specifically of one type or other. Usually all conflicts fall somewhere in between the two extremes.

Types of Conflict

Now you will learn about various types of conflicts and how to resolve them.

1) **Intra Personal Conflict:** It is a conflict that a person has to face with himself. The situation is common with everyone and one has to face it at different situations in day to day life, e.g. when one has to make a choice between different goals or means to achieve the goal through different ways. Even when one has to do certain jobs against his will, but under some compulsion, one is in conflict with self. As the conflict is arising from within, the person has to solve it himself. However the best way is to discuss with someone who is a close friend or individual with whom one can confide and trust and then take a decision.

2) **Interpersonal Conflict:** It is the conflict between two individuals. When a person does not like the other one, due to reason whatsoever may be, they are in conflict with each other.

   To resolve such conflicts, one has to identify the reason or source and has to deal with it. There may be various sources of such conflict, some of which are as under:

   a) Different attitude, nature and style of individuals which are mismatch to each other.

   b) There may be a competition among the individuals that may be obvious or virtual.

   c) Members sharing the same goal thus prompting unhealthy competition among the members.

      An example of such type of conflict is when a Chief Medical Officer (CMO) retired and there is a scope that one of the four Deputy CMOs would be promoted. This situation would lead to competition among the Dy. CMOs , and one may try to supress other or start complaining against another to the Director.

   d). Sometimes there is an exploitation tendency on some part of individual, particularly seniors who try to exploit the subordinate or the newcomers, who in turn may try to obey but after a certain limit, when they are overstretched, are in conflict with the senior. Even in a group, one group member may try to exploit others to get some undue advantage or create a situation where one has to work less and bank on the other members of the group to work for them.

   e) Reward System: In a competitive environment, it may be the custom that everytime a person gives more quantitative output he is rewarded, although other members of the group has also contributed to the end result. In such a reward system, the other members develop a prejudice against the rewardee and in turn may become hostile to the person that in itself would prevent the organisation in achieving its ultimate goal.

   Interpersonal conflicts as mentioned above are very common in any organisation and the managers should not be too bothered about them, as they do not lead to any tense situation and are controllable.

   An opportunity to work together helps to reduce such interpersonal conflicts. For this it is the responsibility of the top management with the help of public relation department to create a team spirit among the staff members and a closely-knit environment. One of the common source of such interpersonal conflict is the stereotyping, when people who had been working in the organisation for a long time are resistant to the entry of a new manager, more so, when the newcomer has some additional qualification. In such circumstances, both the parties would try to maintain a distance from each other and would try to evaluate each other. This would prevent meaningful interaction among them. However, to solve such a situation an environment is created by the superior, e.g., giving them a task, where there is no option, but everyone has to interact with each other, a bridge is created, and after some time it would be noticed that all are in harmonious relation with each other. Therefore, the reader would comprehend that both the parties who were eye to eye with each other and were in conflict, but after they have worked with each other and shared their view points has become friends.

3) **Intergroup Conflict** : These conflicts are between different groups or different departments of the same organisation. In any organisation there are many departments or subunits, and all of them has to work with each other in order to achieve the organisational goal. For example in a hospital, the administrator is dependant on clinicians and nursing staff who are a directly related for patient care. On the other hand he has to depend on other departments also like on materials department for purchase of

medicine and equipment, on marketing department for empanelling various organisations to increase patient input, on engineering department for maintenance and new constructions in the hospital. These departments in turn are interdependent on each other.

It is these interdependence, that result in conflict, the reasons of which may be one of the following:

a) **Status differences:** Some departments may have inferiority complex because they are informally seen and ranked as low, in comparison to other departments. For example the finance department may have the feeling that they are not recognised by the other staff because of their no direct involvement with patient care. This low feeling may be shown by demonstrating their power and creating disruption or problematic situations, like delaying payment of salary or issuing of cheques etc. Similarly the personnel department may show their authority by not recruiting resident doctors, to replace for one who has resigned, and insisting on proper procedure for selection that are to be followed, thus causing delay in deployment or putting some objections. It is not uncommon for audit people to harass some department just to show their higher status and authority.

b) **Overload on some department:** It is not uncommon in any organisation that some of the departments have more workload than other. Continuous overload of work may lead to members demanding some incentives or reward to compensate for their extra work. This would lead to conflict and has to be dealt with in an intelligent way. If some incentive were granted to such department, the same demand would be raised by other departments, which in turn would pose a new problem.

4) **Role Ambiguity:** Lack of job description or role of different departments may quite often lead to ambiguous situation and absence of some mechanism to sort them out would lead to conflict between various departments. Even in old and grown up institutions, the functioning style and attitude keeps on changing according to the demand of the situation. New departments are created with new roles or part of job of some department, which may lead to confusion and ambiguities. Whenever such changes are made, it is always desirable to involve all persons who would be affected. Such continuous interactions between individuals of different departments goes a long way in preventing conflicts, e.g. weekly coordination meetings between various departmental heads, chaired by the Director helps to sort out the differences, doubts about responsibility and thus helps in reducing conflicts.

5) **Lack of Knowledge about Other Department:** In today's world of complex environment, members of some department may be totally unaware of the job of other department, more so, if they are distantly related. Therefore one department may have the feeling that the other department has no work and are a parasite on the organisation. For example in a hospital, the medical residents could never digest the fact that the accounts department, which comprise of 8-10 staff members are overworked. For them, the job of account department is only to make salary statements that too once in a month. However, they would never realize the other jobs that accounts section has to do like preparing balance sheet, auditing etc. To combat such a situation interdepartmental contact or exposure programmes like financial management for non-financial department helps in promoting mutuality and collaboration. These programmes would help in appreciating functioning of other departments.

6) **Differential Reward System:** This is another source of interdepartmental conflict. The departments, which are overloaded, if they are provided some reward like special allowance or overtime, would lead to envious feeling among other departments. Proper staffing and withdrawing persons from lesser workload area to higher workload area after proper training, and proper and uniform reward system are to be establisehd to prevent interdependental conflict.

Managing Intergroup Conflicts

1) **Avoidance:** To use all mechanisms not to face conflict by avoiding the situation or showing indifference to the situation till the parties who were emotionally charged, cools down, and it helps as a good escape strategy. The problem is investigated after some time, when the strong emotion has settled down and then taking a decision. But this avoidance strategy also sends out a wrong signal, particularly when leadership

positions are involved as they would be seen as lacking courage or not having decision taking capability and in turn would provide an opportunity to subordinates by perpetually creating such conflict like situation in order to weaken the leader. Moreover, any such issue, which once is avoided, may resurface again with a more complicated face.

2) **Diffusion:** The strategy involves listening to the problem, but not taking any concerete decision, instead aims to diffuse the situation, by taking some ad hoc decision or giving assurances, e.g., immediately comprising an expert committee or negotiation committee to probe the matter and wait for the committee's recommendations. This strategy does helps in avoiding the acute problem, but in turn would leave anxiety and dissatisfaction among the staff member. Moreover the recommendations as suggested by the committee may in future put the administration in a more difficult situation, particularly when the recommendation could not be implemented or new issues may crop up with the recommendation.

3) **Confrontation:** Confrontation involves negotiation and use of authority. The administration develops a one-point programmes till a decision is taken and all other issues of lesser importance are ignored or are sidelined. This strategy is applied when the conflict has taken a large dimension and there is a likelihood of disruption of the functioning of the organisation. The authority has to take a policy decision, or he may have to decide in favour of one party or even have to reprimand somebody and punish him other party. For this the authority has to take a bold decision and no ambiguity is left in order to solve the conflict for once and for all.

Activity 3

1) One fine morning just after you have entered your CMO office you face many of your old staff who are agitated and are complaining of their new boss whom they are yet to meet face to face, but has received a strict guideline from him about the guidelines to be followed while in the department. How would you tackle the issue as a CMO?

2) There is a sudden notice of intimation of strike from next day following an incident when a sanitary supervisor has slapped a sanitary worker. What would be your action?

3) There is an incident when a patient who happened to be the people's representative to the assembly died at midnight while in ICU due to some post operative complication following a surgery in the hospital. The patient has an outstanding bill of several thousand rupess and a crowd has gathered to receive the body while the night supervisor has denied to hand over the body till payment are made and dues are cleared. After taking charge, how would you proceed to tackle the issue?

   a) Reinforce the night supervisors stand.

   b) Call the Police in anticipation of violence.

   c) Wait for the Chief Administrator who is out of town and is expected to arrive in the evening, and then start negotiation.

   d) Hand over the body after brief negotiation.

   e) Would carry on negotiation till evening, and let the Chief Administrator to take decision.

2.7 LET US SUM UP

In this unit you have learnt that image of any organisation does not develops on its own but much strategic planning is required with amalgamation of science and art. You have also learnt that for any hospital, the patient and their satisfaction is important, as it is the satisfied patient who acts as virtual PRO for the organisation and creates the image of hospital among the society. Further you have learnt that in a large hospital, a department as a whole is required for public relation that also carries out many other functions. Each and every person under the roof including administrator, staff, patient and attendants can help in building up of the image of the hospital. The job is not so smooth sailing as it seems to be, but many a times has to bear the brunt of hurricanes in the form of conflict. Towards the end of the unit, you have learnt about the conflicts, nature and types of conflicts and how to resolve the conflicts.

2.8 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) MBA or PG Diploma – Public relation or Journalism should have handled similar position in other organisation.

2) c) Vision/mission of the hospital.

3) To send an acknowledgement, preferably signed by the hospital administrator.

UNIT 3 LEGAL ASPECTS AND CONSUMER PROTECTION ACT

Structure

3.0 OBJECTIVES

After going through this unit, you should be able to:

- enumerate the medico-legal duties and responsibilities of doctors;
- explain the implications of Consumer Protection Act for hospitals; and
- describe the importance of medical records in hospitals.

3.1 INTRODUCTION

In this unit you will learn about the medico-legal aspects of clinical practice, implications of the Consumer Protection Act and its application in hospitals, and the importance of medical records.

In this unit you will also learn about the medico-legal duties and responsibilities of doctors, the types of consent used in clinical practice. With the advent of the Consumer Protection Act in 1986, the number of litigations against doctors has increased. The literate and fully aware patient has started asking for rights; and the recent judgement of Supreme Court has brought a number of government hospitals under the ambit of this Act. This unit also

describes implications of the act for health care professionals, and gives an overview of professional indemnity schemes.

Importance of proper medical records cannot be over looked in such a scenario; and in this unit you will learn about the importance of maintaining proper medical records.

3.2 MEDICO-LEGAL ASPECTS OF CLINICAL PRACTICE

3.2.1 Definitions

A medico-legal case is defined as one, "where an attending doctor, after taking the history and examination of the patient, thinks that some investigations by the law enforcing agencies are required so as to fix responsibility regarding the case in accordance with the law of the land."

3.2.2 Duties and Responsibilities of Doctors

As the basic objective of medical profession is to provide service to humanity, medical practitioners have certain obligations to the state. The duties or responsibilities can be broadly categorised into the following:

Compulsory Duties

These include:

i) Compulsory notification of births, deaths and various notifable diseases.
ii) Responding to call for emergency military service.
iii) Reporting of cases of homicidal poisoning.
iv) Reporting of all un-natural deaths.
v) Reporting of cases covered under privileged communications.

Voluntary Duties

These comprise:

i) Responsibility to continue to treat patients with reasonable skill and care. Keep professional secrets inviolate (except under privileged communications) and take special precautions whenever needed.
ii) To conduct medical examinations after obtaining due consent.
iii) To conduct operations after taking informed consent and observing the necessary precautions for safety of patients.
iv) To issue certificates with regard to illness, death, fitness, vaccination, insurance etc. after taking due care.
v) To conduct post-mortem examination in medico-legal cases after proper authorisation.
vi) To inspect prisons and reformatories after obtaining authorisation.
vii) To attend to accidents as a moral duty.
viii) To conduct medico-legal examinations and issue relevant certificates.

It is purely the responsibility of the attending doctor to register the medico-legal case at the earliest. It is important to remember that request of the patient or attendants (relatives, friends) for not registering the case as medico-legal should not be entertained. Doctors working in hospitals run or aided by government cannot refuse medico-legal cases; and are perforce bound to accept such cases. Private practitioners have the choice to select patients. The main duty of the doctor in such cases is to observe and record findings carefully and correctly. In case the patient is to be referred to another hospital the referral slip should be attached to the medico-legal report form. Duplicate copy should be preserved.

3.2.3 Professional Secrets and Priveleged Communication

It is to be noted that the relationship between a doctor and patient is in the nature of an "implied contract" ; which although not written; is none the less legally effective. This is so

because the circumstances surrounding the transaction make it a reasonable or necessary assumption that a contract existed between the parties by tacit understanding. As a result of this; default on the part of either party renders that party liable to have damages assessed against it. However, this implied contract is not established during the following cases:

- When doctor renders first aid during emergency.
- When doctor makes pre-employment medical examination for prospective employer.
- When doctor performs an examination for life insurance purposes.
- When doctor is appointed by the court to examine accused.
- When doctor examines on the request of an attorney in law suits.

A professional secret is "one which a doctor comes to know in his professional capacity while dealing with patients." It should be understood that the doctor should not divulge anything which he/she has come to know in confidence from his patient, either while taking history or during examination or while treating. This is not only a moral obligation; but also a legal one; and the practitioner is liable for damages.

A **privileged communication** is defined as a "communication made by a doctor to a proper authority who has corresponding legal, social and moral duties to protect the public." In these cases the doctor is justified in disclosing bonafide information regarding his patients, e.g.:

- As a witness in a court of law when directed by the judge to do so.
- When the doctor has a moral or social duty to perform.
- When the doctor has to safeguard his own interest.
- When the doctor's duty as a citizen to assist in apprehension of a person who has committed a serious crime outweighs his obligation to his patients.
- When servant is sent by master for medical examination and asks for the results.

3.2.4 Consent

According to section 13 of the Indian Contract Act, "two or more persons are said to consent when they agree upon the same thing in the same sense." Simply stated it means voluntary agreement, compliance or permission. Consent can be broadly classified into two categories as mentioned under:

i) **Implied Consent:** As mentioned in the earlier sub-section, this refers to consent which is not written, that is its existence is not expressly asserted; but none the less it is legally effective. It is evident from the demeanour of the patient i.e. attending the OPD, buying a card, doing registration and waiting outside the room of doctor; and is one of the most common varieties. It does not, however, provide consent to undertake procedures more complex than inspection, palpation, percussion and auscultation.

ii) **Express Consent:** This is one where the terms are stated in distinct and explicit language. It may be oral or written; but oral consent should be taken only for minor procedures, preferably in the presence of a disinterested third party, whose testimony could be relied upon. If taken properly, oral consent is as legally valid as written consent; but the latter has the advantage of easy proof and permanent form. In this era of increased litigation, it is always better to take informed written consent, where the risks associated with the procedure or treatment have been explained to the patient.

Hence it must be noted that the doctor has an imperative duty to inform the patient about the diagnosis, the nature of treatment or procedure, the risks involved, the prospects of success, the prognosis if the procedure is not carried out and other alternative methods of treatment.

Other guidelines with regard to consent are as follows:

- The legal age in India to give consent for medical examination and treatment is 12

years. Hence in patients less than 12 years, consent has to be obtained from parents/ guardian.

- Consent is not required when the patient is unconscious and so gravely ill, that any delay could be dangerous.
- In medico-legal cases brought by the police; consent is implied under section 53(1) of Criminal Procedure Code; hence examination can be carried out even without consent.
- Even after consent has been obtained, the examination should, wherever possible, be made in the presence of a third person (preferably a nurse); especially while examining female patients by doctor of opposite sex.
- In procedures affecting rights of spouse e.g. sterilisation, artificial insemination etc. informed consent must be obtained from spouse.
- Although the consent should be broad enough to cover everything contemplated as likely to be required; the so called "blanket" consent should be avoided.

3.3 CONSUMER PROTECTION ACT

Our country is a democracy where laws are made for the betterment of the society, and its effectiveness has to be gauged by the extent of its utility to the person for whom it is made. It is a welfare state and thus has to fulfil the constitutional goals of looking after health and safety of citizen. The Consumer Protection Act (CPA) was introduced on 19th December 1986 and passed on 21st December 1986 in the Lok Sabha. It came into force on 15th August 1987, and is considered as a dynamic and radical piece of legislation enacted by the Parliament. It has four chapters and thirty-one sections.

This Act aims to provide better protection to the interests of the consumers; to make provision for the establishment of consumer councils and other authorities to provide speedy and cheap remedy to the consumers. It safeguards the following rights of consumers viz. the right to safety, the right to be informed, the right to choose, the right to be heard, the right to redress and the right to consumer education.

3.3.1 Definitions

It is important for us to know and understand the definitions of the terms and terminology in order to interpret the rules and conditions of the Act properly and correctly.

Complaint: An allegation shall constitute a complaint where the goods or services mentioned in the complaint suffer from deficiency in any regard.

Complainant: Any consumer(s) or voluntary consumer association registered under the Companies Act, 1956; or under any other law for the time being in force; the Central or State Government who makes (files) a complaint.

Consumer: Any person who buys any goods or avails of any service, for a consideration which has been paid or promised to be paid; either fully, or partially or in some form of deferred payment.

Consideration: Refers to fees or payment paid to the doctor/hospital. This may be paid; either by the patient or guardian or any other person on behalf of the patient; and in case of death of a patient; his legal heir becomes the consumer.

Service: "Means service of any description which is made available to potential users, and includes the provisions of facilities in connection with banking, financing, insurance, transport, processing, supply of electrical or other energy, board or lodging, entertainment, amusement or purveying of news or other information; but does not include the rendering of any service free of charge or under contract of personal service."

Deficiency: Any fault, imperfection, shortcoming or inadequacy in the quality, nature and manner of performance which is required to be maintained by or under any law for the time being in force; or has been undertaken to be performed by a person in pursuance of a contract.

Consumer Dispute: A dispute where a person against whom a complaint has been made denies the allegation.

Medical Negligence: Medical is falling short of reasonable medical care.

Defect: Any fault, imperfection or shortcoming in the quality, quantity, potency, purity or standard which is required to be maintained by or under any law for the time being in force.

3.3.2 Consumer Protection Councils

Under the Act, Consumer Protection Councils have been established at Central and State level with the objective of protecting and promoting the various rights of consumers:

i) Central Consumer Protection Council consists of about 150 members, is chaired by the Minister in charge of Food and Civil Supplies in Centre, and must meet at least thrice in a year; at such time and place as the Chairman may think fit.

ii) State Consumer Protection Council is chaired by the Minister incharge of Consumer Affairs or Food and Civil Supplies. The number of members in the State Council varies from state to state; and it meets at least twice in a year.

3.3.3 Consumer Disputes Redressal Agencies

Under Section 9, the Act envisages setting up a three tier quasi-judicial redressal mechanism which is as follows:

i) **District Forum:** This is established by State Govt. with at least one forum in each district. Each forum consists of 3 members: (a) A person who has been, or is qualified to be a District Judge as the President; (b) A person of eminence in field of education, trade or commerce; (c) A lady social worker, each of whom hold office for a term of five years or up to 65 years of age, whichever is earlier.

The pecuniary jurisdiction of this is up to Rs. 5 lakhs. Its territorial jurisdiction extends throughout the local limits of the district. Any person aggrieved by an order passed by district forum may appeal to State Commission within 30 days from date of issue of order.

ii) **State Commission:** It is at the level of state and comprises of the following members: (a) a person who is or has been a judge of a High Court shall be the president; (b) two other members who shall be persons of ability, integrity and standing, and have adequate knowledge, or experience of, or have shown capacity in dealing with problems relating to economics, law, commerce, accountancy, industry, public affairs or administration; one of whom has to be a woman.

- State Commission has jurisdiction to entertain complaints where value of goods/ services exceeds 5 lakhs rupees but is less than Rs. 20 lakhs.
- Appeals against the orders of any District Forum in the state.
- To call for case records of district forum and pass appropriate orders in any consumer dispute pending before or decided by District Forum.
- Any person aggrieved by an order made by State Commission may appeal to National Commission within 30 days.

iii) **National Commission:** It is situated at New Delhi and consists of 5 members as follows:

a) a person who is or has been a judge of Supreme Court shall be the President.

b) four other members who shall be persons of ability, integrity and standing and have knowledge or experience of, or have shown capacity in dealing with problems relating to economics, law, commerce, accountancy, industry, public affairs or administration, of which one has to be a woman.

Jurisdiction is to entertain complaints where the value of goods/services and the compensation claimed is more than 20 lakhs. Appeals against the orders of any state commission; to call for case records and pass appropriate orders in any consumer dispute which is pending/has been decided by any state commission.

Any person aggrieved by an order made by National Commission may appeal to Supreme Court within 30 days of date of order.

3.3.4 Other Salient Features

Limitation Period: The various redressal agencies shall not admit a complaint, unless it is filed within two years from the date on which the cause of action has arisen. It can be entertained even after two years provided there is sufficient cause for the same.

Appeals: Appeals will be entertained by both State and National Commission and also Supreme Court even after the expiry of thirty days, if it is satisfied that there was sufficient cause for not filing within that period.

Dismissal of Frivolous or Vexatious Complaints: Where a complaint before any of the fora/ commission is found to be frivolous ; it shall dismiss the complaint (reason to be recorded in writing) and pass an order that complainant shall pay to opposite party such cost, not exceeding an amount of Rs. 10,000.

Penalties: A party or person failing to comply with any order made by District Forum, State or National Commission, shall be punishable (i) with imprisonment for a term more than one month up to three years, (ii) with fine not less Rs. 2,000 to Rs. 10,000.

Enforcement of Orders: Every order made by these three agencies may be enforced by these as the case may be, in the same manner as if it were a decree by the corresponding civil court. In the event of its inability to execute its own orders, it should send such order to the corresponding court within the local limits of jurisdiction. Thereafter, the civil court shall execute the order, as if it was a decree or order sent for execution.

iv) District Forum can entertain cases up to Rs. 5 lakhs. (T/F)

v) Limitation period under CPA is 2 years. (T/F)

3.4 APPLICATION OF CONSUMER PROTECTION ACT IN HOSPITALS

3.4.1 Historical Perspective

In the earlier section you have learnt about the Consumer Protection Act as applicable to goods and services. As far as hospitals are concerned, the private hospitals or nursing homes or polyclinics which charge for the services provided, have been included under the ambit of the Act, since its inception. However, by and large the government run or aided hospitals have been exempted; as they do not charge the patients for services provided.

3.4.2 Recent Judgement of Supreme Court

A landmark judgement was delivered by the Hon'ble Supreme Court in 1996, in the case of *Indian Medical Association* v. *V.P. Shanta and others* (Civil Appeal No. 688 of 1993), wherein the following decisions were taken:

- Service rendered to a patient by a medical practitioner (except where the doctor gives service, free of charge to every patient) by way of consultation, diagnosis or treatment (both medical and surgical) will fall within the ambit of service.
- The fact that medical practitioners belong to a profession and are regulated by Medical Council of India, does not exclude them from this Act.
- Service rendered at a non-government hospital/nursing home where no charges are taken from any person availing the same and all patients (both rich and poor) are

treated free; will be outside the purview of service. Payment of a "token" amount for registration purpose only will not alter the position.

- Service rendered at a non-government hospital/nursing home where charges are paid by those persons who are availing the facilities and are able to pay; and other poor patients are treated free of cost shall also treated as 'service'. Recipient of "free" service would also be a consumer.
- As regards government hospitals; those hospitals where no charge whatsoever is taken from any patient; rich or poor–falls outside the purview of Act. Charging of a "token" amount for registration purposes only will not alter the position. However, services rendered at government hospitals/dispensaries where some payment is taken from patients who can pay, and poor patients are treated free would also fall within the purview of the Act.
- Service rendered by a medical practitioner or hospital or nursing home cannot be regarded as free of charge, if the person availing service has taken an insurance policy for medical care, where the charges for consultation, diagnosis and treatment are borne by Insurance Company.
- In those cases where as a part of the conditions of service, the employer bears the expenses of medical treatment of an employee and his/her dependent members; this would constitute "service" as per the act, and could not be considered as being free of charge.

3.4.3 Implications for Health Professionals

In the beginning of this unit you have learnt that the doctor-patient relationship is a "contract" under which the doctor must continue to provide "reasonable" care as long as the patient is being treated by him/her. There are some areas of high risk which need caution viz.,

Failure to attend to patients: Especially children with acute conditions, which have rapid down-hill course.

Retention of objects in operation sites: Swabs, packs, instruments can be left behind if proper counting and retrieval is not done.

Amputation of wrong limb or digit, extraction of wrong eye or tooth: The reasons are carelessness in hospital notes, errors in pre-operative skin marking, and failure to check the name of the patient in O.T.

Therapeutic hazards: These can be avoided by administration of the right drug in the right dosage, via the right route; and informing patient/attendants of potential risk of treatment.

Medical case records: It is extremely important to fill up the case sheets carefully and properly; as these can be produced in courts as evidence. In complicated cases, negative findings should be mentioned. Special caution should be taken in medico-legal cases.

Consultations and referrals: These should be done in writing wherever required.

Channels of Communication: It has often been found that lack of improper communication regarding patients health/illness; leads to litigations. Hence, it is important that patient or attendants should be informed about the diagnosis, treatment and prognosis in simple understandable language.

Prescription of Non-specific/Ayurvedic Preparation: It is advisable not to prescibe non specific or Ayurvedic preparation; as the knowledge regarding constituents is not known.

3.4.4 Professional Indemnity Schemes

This refers to the tertiary level protection against the outcome of litigation which is in operation in several parts of the country. In this, the policy will indemnify any act committed by the medical professional (doctor) and his/her qualified attendant for the period of insurance. During this period, any legal liability will be taken care of by the third party. A number of companies are offering these indemnity insurance schemes where in the medical

practitioners are classified into various categories. The premium charged depends upon the threat or risk perception in that particular category.

3.5 MEDICAL RECORDS

Medical records is a chronicle of the historical evolution of medical and scientific progress through the ages. Good medical records maintained in a hospital are essential for the safe and efficient care of the patient.

McGibony defines medical records as "a clinical, scientific, administrative and legal document relating to patients care, in which are recorded sufficient data written in the sequence of events to justify the diagnosis and warrant the treatment and results." It should be understood that medical records indicate whether the treatment provided to the patient are in accordance with the existing knowledge and expectation of present day scientific medicine or not.

In simple terms medical records deal with the whom, what, why, where and when of patient care in the hospital.

3.5.1 Importance of Medical Records

The importance of medical records can be described under the following heads:

For the Patient

- Document of patient related activities.
- Legal evidence.
- Avoid ommission/repetition/duplication of diagnostic and treatment measures.
- Assists in the continuity of care.
- Ready information for life and health insurance.
- Assists in fixing diability entitlements.

For the Physician/Doctor

- Assurance of quality, adequacy of treatment measures/medical care.
- Helps evaluation of medical care.
- Legal protection.

For the Hospital

- Documentary evidence for evaluation of medical care, proficiency of doctors (Medical audit).
- Assists in planning and justification of resources.
- Legal protection of hospital.

For Public Health

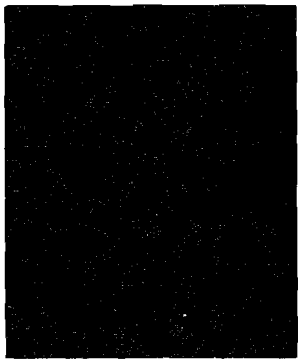
- Reliable information regarding : Mortality, Morbidity profile of dependent population.
- Assists in planning preventive and social measures.
- Early warning of incidence of communicable disease.

For Medical Education and Research

- Assists in deriving conclusions or investigating them.
- Aids in informal education of students and physicians.
- Forms basis of clinical research.
- Reliable source of material for advancement in medical science.

3.5.3 Storage and Custody of Medical Records

The hospital is the actual owner of medical records and safe custody and storage of medical



records is the prime responsibility of the hospital. Ideally all records should be preserved for infinite period, but practically it is not possible. Hence, each hospital should evolve its own policy for storage of records. In general, records should be kept for minimum of two years as cases can be filed under Consumer Protection Act within that period. It is a practical solution to keep OPD records for five years; and indoor patient records for 10 years. Medico-legal records in litigation cases should be kept for 25 years or till the case is decided.

ii) Amputation of wrong digit is liable for punishment under CPA. (T/F)

iii) Medical records show the progress of medicine. (T/F)

iv) Professional indemnity schemes are valid for one year. (T/F)

v) Medical records are admissible as evidence in court of law. (T/F)

3.6 LET US SUM UP

In this unit you have learnt that just as it is important to know about the duties and responsibilities of doctors, it is equally important to keep pace with the time and be aware of the various provisions of the Consumer Protection Act. You have also learnt about the importance of taking proper consent before performing procedures, and the important areas where caution has to be exercised while dealing with patient. You have learnt about various professional indemnity schemes and also about the importance of medical records and the safe custody of medical records.

3.7 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) A medico-legal case is defined as one, "where an attending doctor, after taking the history and examination of the patient, thinks that some investigation by the law

enforcing agencies are required so as to fix responsibility regarding the case in accordance with the law of the land."

The duties or responsibilities of doctors can be broadly categorised into the following :

Compulsory Duties

i) Compulsory notification of births, deaths and various notifable diseases.
ii) Responding to call for emergency military service.
iii) Reporting of cases of homicidal poisoning.
iv) Reporting of all un-natural deaths.
v) Reporting of cases covered under privileged communications.

Voluntary Duties

i) Responsibility to continue to treat patients with reasonable skill and care, keep professional secrets inviolate (except under privileged communications) and take special precautions whenever needed.
ii) To conduct medical examinations after obtaining due consent.
iii) To conduct operations after taking informed consent and observing the necessary precautions for safety of patient.
iv) To issue certificates with regard to illness, death, fitness, vaccination, insurance etc. after taking care.
v) To conduct post-mortem examination in medico-legal cases after proper authorisation.
vi) To inspect prisons and reformatories after obtaining authorisation.
vii) To attend to accidents as a moral duty.
viii) To conduct medico-legal examinations and issue relevant certificates.

2) Consent is important in present context, because of the increased number of litigations against doctors under Consumer Protection Act. Every doctor has an absolute and imperative duty to inform the patient about facts related to the diagnosis, treatment or procedure to be carried out, the risk involved, the prognosis if procedure is not done before undertaking any procedure.

3) **Consumer:** Any person who buys any goods or avails of any service, for a consideration which has been paid or promised to be paid; either fully, or partially or in some form of deferred payment.

Service: Means service of any description which is made available to potential users, and includes the provisions of facilities in connection with banking, financing, insurance, transport, processing, supply of electrical or other energy, board or lodging, entertainment, amusement or purveying of news or other information; but does not include the rendering of any service free of charge or under contract of personal service.

Deficiency: Means any fault, imperfection, shortcoming or inadequacy in the quality, nature and manner of performance which is required to be maintained by or under any law for the time being in force; or has been undertaken to be performed by a person in pursuance of a contract.

4) The various consumer disputes redressal for a under the Consumer Protection Act are as follows:
i) District Forum – At District level.
ii) State Commission – At State level.
iii) National Commission – At National level, situated at New Delhi.

5) i) F ii) F iii) F iv) T v) T

Check Your Progress 2

1) The most important implication is that those patients who are getting 'free' treatment in

govt./non-govt. hospitals where some patients are being charged; can also file cases under Consumer Protection Act.

2) Medical record is defined as "a clinical, scientific, administrative and legal document relating to patients care, in which are recorded sufficient data written in the sequence of events to justify the diagnosis and warrant the treatment and results." It is useful for the doctor to maintain proper records for protection from legal suits; assisting in continuity of care and helps in evaluation of care.

3) i) F ii) T iii) T iv) T v) T

3.8 FURTHER READINGS

McGibony, *Textbook of Hospital Administration.*

Parikh's Text book of Medical Jurisprudence.

UNIT 4 FUNDAMENTALS OF QUALITY MANAGEMENT

Structure

4.0 OBJECTIVES

After going through this unit, you should be able to:

- identify the problem areas, and their causes and effects relationship;
- describe the concepts of quality care and quality management;
- enumerate the needs and benefits of quality system of management;
- list the steps involved in organising a quality management programme; and
- examine and analyse various methods required to be adopted to assess delivery of efficient and adequate quality of medical care.

4.1 INTRODUCTION

This unit aims at making you aware of the problems associated with delivery of medical care services by various health care establishments; we will also discuss the problems encountered by the recipients of care. It also highlights latest concepts of quality management system which can be adopted and implemented by administrative authorities at various levels, to be able to provide efficient and adequate medical care.

You are aware that with the advancement of medical sciences and technology in recent years there has been a growing sense of discontent amongst the people. The cause of this discontent in the society is the failure of the health care delivery system in India to meet the expectations of people. During the last decade the quality of medical care and hospital services have come under heavy scrutiny from the consumers and the community at large. The rising cost and scarcity of resources have added a new dimension to the problem. Patient considers health care as a basic human need and right, and he is vitally interested

not only in the availability of care but in the quality of care as well. He has also started questioning providers of care about the quality and cost of care and, in a number of cases, have gone to court of law or consumer forum for justice.

The massive investment made by the society in health care has had mixed results, in that some people have been benefited whereas majority of people do not have access to the quality health services. The inequities that require immediate attention are inaccessibility, fragmentation, and high cost of health services combined with lack of concern with total well being of the individual.

You will appreciate that the present situation calls for efficient and economic management of medical care delivery system, capable of providing adequate medical care, both in quality and quantity, at minimum cost, to the satisfaction of the consumers. This implies proper organisation and efficient management of the hospital system for better utilisation of physical facilities, staff, equipment, clinical services, and diagnostic and therapeutic facilities. Quality management strategies introduced during early 90's aim at optimum utilisation of available resources, focus on cost effective methods, and introduction of hospital-wide systematic on-going quality control and quality assurance programmes to continuously monitor and evaluate the performance, to improve the quality of care rendered, and to increase productivity of the health care organisation.

4.2 HISTORICAL BACKGROUND

You have already learnt that Modern medicine in a large way is indebted to Hippocrates, known as the "father of medicine", who lived and worked in Greece some 400 years before Christ. He was a modern type of scientist physician in that he observed closely with a surprisingly open mind; he described what he saw, he recorded his failures as well as his successes. Much of what wrote so long ago is still of interest and value today. He required his students to swear to an oath that the care administered to patients by them would always be to the best of their ability. This was to ensure quality care.

The great names in Hindu Medicine are those of Sushruta in the 5th Century before and Charaka in the 2nd Century after Christ. Sushruta, the professor of medicine in the Banaras University wrote down in Sanskrit a system of diagnosis and therapy whose elements had descended to him from his tutor Dhanwantari. He described many surgical operations, such as, cataract, hernia, amputations, setting of fractures etc. Medical record keeping stands today as proof of quality care ensured in those days.

Coming to the medieval period, we find that patient records were kept in St. Bartholomow's Hospital, London, the only hospital still exists (1137).

In nineteenth century, establishment of the famous Massachusetts General Hospital, Boston USA is regarded as the landmark in the development of quality care concept, by ensuring proper medical record keeping.

Tribute must be paid to Florence Nightingale, pioneer in modern nursing. She advocated that "no harm should be done to a patient under care", and she was responsible for laying down the standards of nursing care in 1859.

In twentieth century the idea of enforcing quality care by medical audit may be traced back to 1900, when education leaders in the medical profession in the USA were trying to cope with the problems of commercialism and general lack of skill of the profession. Consequently American College of Surgeons was formed in 1913. Its Board of Regents decided that the objective of "proper care of the sick and injured" could be achieved by a continent-wide standardisation of hospitals. Thus a "Hospital Standardisation" programme was inaugurated in 1918. One of the major requirements of the hospital standardisation was the regular review and analysis of the clinical work of the hospital by the medical staff through the medical staff conferences. In 1928, Thomas R. Ponton, MD presented a plan for "Professional Service Accounting" and "Medical Auditing" based on the procedures used by financial accounts.

Quality Assurance activities began with the formation of Joint Commission on Accreditation of Hospitals JCAM in USA, in the 1960s. A document specifying "Standards for Hospital Accreditation" was published jointly by the American College of Physicians,

American College of Surgeons, American Hospital Association and American Medical Association.

The Joint Commission on Accreditation of Hospitals (JCAH) was renamed as Joint Commission on Accreditation of Health Care Organisations (JCAHO). They have revised the document in 1995 and published as "Accreditation Manual for Hospitals". The mission of the JCAHO is to improve the quality of care provided to the public.

The Geneva based International Organisation for standardisation was raised in 1946 with India as a founder member amongst 25 countries at that time. ISO 9000 series of standards have generated maximum interest world wide and already 90 countries have adopted these so far, including all developed countries. The prime role of quality system is to provide effective means to assuring that the customer requirements are met fully. The system is aimed to achieve, sustain and improve the quality of product or service.

In India, quality assurance programme or medical care standards for hospitals are non-existent. Bureau of Indian Standards (BIS) have adopted the concepts of total quality management advocated by International Standards Organisation (ISO) as applicable to services provided by health care organisations. However, the progress made by BIS in laying down standards is very slow. A few corporate hospitals have made remarkable progress in adopting ISO standards for accreditation.

4.3 CONCEPTS OF QUALITY CARE AND QUALITY MANAGEMENT

You are already aware of that health is considered as physical, mental, spiritual and social well being and also enjoyment of highest standard of health is fundamental human need and right. Society as a whole has some responsibility to provide care of the sick and to prevent the occurrence of disease among its members. In the previous block you have also learnt that hospital is an institution evolved round the concerned care for sick among the population.

What is that the average patient really wants from health professionals? Patient wants someone who beside being a primary physician and an expert in diagnosis, can also give advice, allay fears and educate; secondly, patient is vitally interested not only in the

availability of care but in its quality as well, and is also concerned with the cost of care; thirdly, he is interested in well patient care, i.e. promotive and preventive care; fourthly, he expects personal attention as OPD or in-patient.

Health care services include a wide variety of quality aspects all of which are important. In case of medical services, the sellers are doctor, hospital, nursing home, clinic etc., because they offer health services at stipulated prices. The buyer, i.e. the patient as a customer wants acceptable quality services which must be commensurate with what he is paying to the seller. Acceptable quality services not only include the quality of direct medical services, such as, diagnosis, medicines, surgery, and treatments, but indirect operations, such as, administration, purchasing, stores, house keeping, linen services and so on, are also included as their costs are reflected in what the buyer pays. It may also include quality of performance that is directly connected and closely related to health care, such as, food, housing, safety, security, attitude of employees, and other factors which arise in the context of hospitals and nursing homes.

4.3.1 Concepts of Quality Care

You will appreciate that the key person for whom all activities are performed is the patient and the key word related to health care services is quality, which is understood as customer satisfaction. Therefore, the quality of service should always be in line with the customer's needs and expectations.

The "Quality of Service" may be defined based on ISO 8402 as, **"Totality of features and characteristics of service that bear on its ability to satisfy stated and implied needs of its patients."**

In this definition the "features and characteristics" refer to specifications relating to standards for various dimensions of quality, such as, accessibility, appropriateness, continuity, effectiveness, efficiency of care and so on. As regards the customers **"stated and implied needs"** his main aim of coming to a hospital is to get totally cured of his ailment. His implied need may be treatment in the shortest time at most reasonable cost, and possibly physical and emotional security.

The quality of care generally means the degree of excellence of the medical care delivered, whether it meets or exceeds accepted standards. Criteria necessarily changes with improved efficiency related to technological advancement; therefore, standards of quality change with time. For example, in 1960s a cardiac patient was satisfied with an ECG test but now with newer technology the patient probably expects a Tread Mill test or an Echo Test. Achievement of satisfactory quality involves implementation of quality needs at all stages of process of care, like diagnosis, treatment and post treatment follow up and monitoring.

Quality of care has been defined by JCAHO as **"The degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge"**. Dimensions of quality include the following: Patient perspective issues, acceptability, continuity, effectiveness, equity and efficiency.

1) **Dimensions of Quality in Health Care**

- Patient perspective issues (patient focused functions) Patient Rights, organisational Ethics.

  —Rights to information

  —Considerate and respectful care

  —Right to privacy, Safety

  —Right to choose and to be heard

  —Right to Consumer education

- Acceptability includes

  a) accessibility

  b) the patient-practioner relation

  c) amenities

d) patient preferences as to effects of care

e) patient preferences as to the cost of care

- Effectiveness—Degree to which the care proposed would achieve the expected outcome, given the present condition of patient and current science and technology of health care.

- Equity—Conformity to a principle that determines what is just or fair in the distribution of health care and its benefits among the members of a population.

- Efficiency—Work of the services as a whole, not the end itself but the way the end is achieved; concerned with systemic efficiency of various facilities which put together contribute towards quality of care at minimum cost.

- Efficacy—The degree to which the care of the patient has been shown to accomplish the desired or projected outcome(s).

You might wonder if an assessment of quality is at all possible, seeing the multiplicity of dimensions or attributes relevant to the concept of quality, and the possibility the goodness in one might conflict with goodness in another. Fortunately, the principles of "Contextuality" offers a way out of the difficulty. You will appreciate that in any given situation certain dimensions are more important and relevant; other components can be left out, although in a different situation, those excluded components would be the very ones to include.

2) **Conceptual Issues Relating to Quality Care and Cost**

From the foregoing description you will appreciate that prime focus in quality management is not on providing the best possible care at any cost. The whole emphasis is on making available care of an acceptable standard as per needs of each patient, at the least cost. The following factors are relevant for consideration:

i) ***Preventive Versus Curative Care***

Past research findings have undoubtedly established the fact that promotive and preventive health care schemes are definitely more cost effective than curative and rehabilitative care for the population. However, at a micro level, where an individual patient is concerned if appropriate care is rendered at OPD level it is possible that inpatient admission may be avoided. Again, as inpatient prevention of nosocomial infection becomes important to avoid extra length of stay, which add to the hospital cost.

ii) ***Manpower Substitutability***

It means allocation of right job needing particular skill to the right person. Delivery of health care involves series of activities ranging from the highly skilled sophisticated activities to the most ordinary repetitive ones. It is necessary to identify which health worker can perform each task efficiently at minimum cost. For example routine BP can be recorded easily by a nurse for which doctors' time should not be wasted.

iii) ***Quality Care Versus Costs***

It is commonly believed that emphasis on quality means generous use of sophisticated technology, which of course, result in escalation of costs. Quality care means need based care, which should ensure nothing less nor anything extra done than is essentially required. Aim should be to provide the best under the given circumstances and whatever diagnostic and therapeutic procedures are necessary are carried out with maximum efficiency, effectiveness and economy.

iv) ***Quality Care and Productivity***

Efficient utilisation of resources will ensure better quality which in turn will reduce cost and increase productivity. Marketing strategies are required for ensuring optimum bed occupancy and maximum use of costly sophisticated diagnostic and therapeutic equipment. Work standards are necessary for quality performance by minimum staff and to monitor labour productivity on regular basis. Clear cut policies, value analysis, adoption of inventory control techniques, proper preventive and breakdown maintenance, control over

misuse, overuse of resources like drugs, Lab, imaging facilities will add to the quality care and increase productivity by reducing cost.

4.3.2 The Concept of Quality Management System

With liberalisation and globalisation of Indian economy, quality has become a buzzword for survival in the competitive world market. It is obvious that health care costs are escalating at a dizzying pace. When cost in manufacturing environment reaches a dangerous proportion the same is efficiently controlled by quality management techniques. To understand the coplexities of introduction of quality management in health care services it is necessary to understand the functioning of hospital system.

1) **Hospital System**

In Block 1 of this course you have learnt about the concept of hospital as a system. You have learnt that a system is a hierarchical chain of system and subsystems, interconnected and interdependent, having clear objectives at each level of the system or subsystem, obtains enough inputs from the environment to offset its output; it operates with varying processes or methods to achieve the ultimate objective of the system.

You will appreciate that for efficient management of hospital, the administrator should have a conceptual model of a hospital which functions as a system, consisting of various service areas as subsystems, to achieve ultimate objective of patient care. A large hospital may have 40-70 departments, which may be functionally grouped under following heads:

a) **Clinical and Nursing Services**: such as OPD, OT, Inpatient, Emergency Services

b) **Supportive Services**: X-ray, Laboratory, Blood Bank, Records, Dietary etc.

c) **Utility Services**: Laundry, CSSD, Engineering, Transport, Communication, Security etc.

d) **Business Services**: Personnel, Finance, Materials, Administration etc.

The system concept as applied to a hospital will imply collection of departmental subsystem components, which operating individually and collectively perform a set of operations in the accomplishment of defined objectives of the hospital system, i.e. delivery of patient care services.

The 'System Concept' in management is only a tool, which the administrator can use to correct the disorganised resources of men, machines, materials and money into a useful and effective institution. Management is the process whereby those unrelated resources are integrated into a total system of objective accomplishment.

Before you proceed further let us examine a simple model of hospital system as shown in Fig. 4.1. In this figure you will see that the patient information obtained and fed to the decision centre which represents the doctor, who makes the diagnosis. He in turn orders certain supplies and services for diagnosis and therapy. These supplies and services are checked, and administered by the doctor or his representative, the nurse. The second decision centre as well as the first decision centre regulates the flow of patients stay in the hospital. Statistical data obtained from medical records of discharged patient provides further information to the decision centres for planning of the future services. The regulatory function is accomplished by decision centres through their control on action centres, i.e. all departmental sub-systems in the organisation, involved in patient care. For simplicity, it is not possible to show all the action centres, but their existence is apparent by the fact that there is recovery or output rate, which is possible only with the assistance of all supportive, utility and business services.

You may have observed the following salient features in the model of hospital system, which are very relevant for the quality management system:

a) There is a continuous flow of information from the time of patients' admission till after discharge which are essential for decision making.

b) Each sub-system (ward unit as shown) has a clear objective, obtains input from its environment (both internal and external) and operates with varying processes or methods to achieve an output or ultimate objective of the system.

c) There are decision centres (both doctors and administrators) who control input and output rate of patients, supplies and services.

d) A clear cut feedback system is available for the users for planning, monitoring evaluation and decision making.

e) Medical records play a vital role in providing patient care related data for both professional and administrative management.

2) ISO-9000 Quality Management System

Quality Management is concerned with "All activities of the overall management function that determine the Quality Policy, Objectives and responsibilities, and implement them by means such as quality planning, quality control, quality assurance and quality improvement." Quality management is the responsibility of all levels of management but must be led by the top management. Its implementation involves all members of the organisation.

As already stated earlier, the ISO-9000 series of standards for quality management system have generated maximum interest world-wide and already 90 countries have adopted these so far. ISO-9004 is a guide for application of quality management system. It is in two parts, Part-1 for manufacturing sector and Part-2 for service sector, like health and hospital services.

This quality system is based on the principle that prevention is better than cure. The prime role of quality system is to provide an effective means to assuring that the customer requirements are met fully. The system is aimed at firstly, to achieve, sustain and improve the quality of product or service; secondly, assurance to the management that internal controls are effective, and thirdly, assurance to the customer that the service conforms to his requirement.

The main emphasis of ISO-9000 series of standards is on the following:

- Every man is involved in maintaining the quality of the activities that he performs apart from the centralised quality checks.

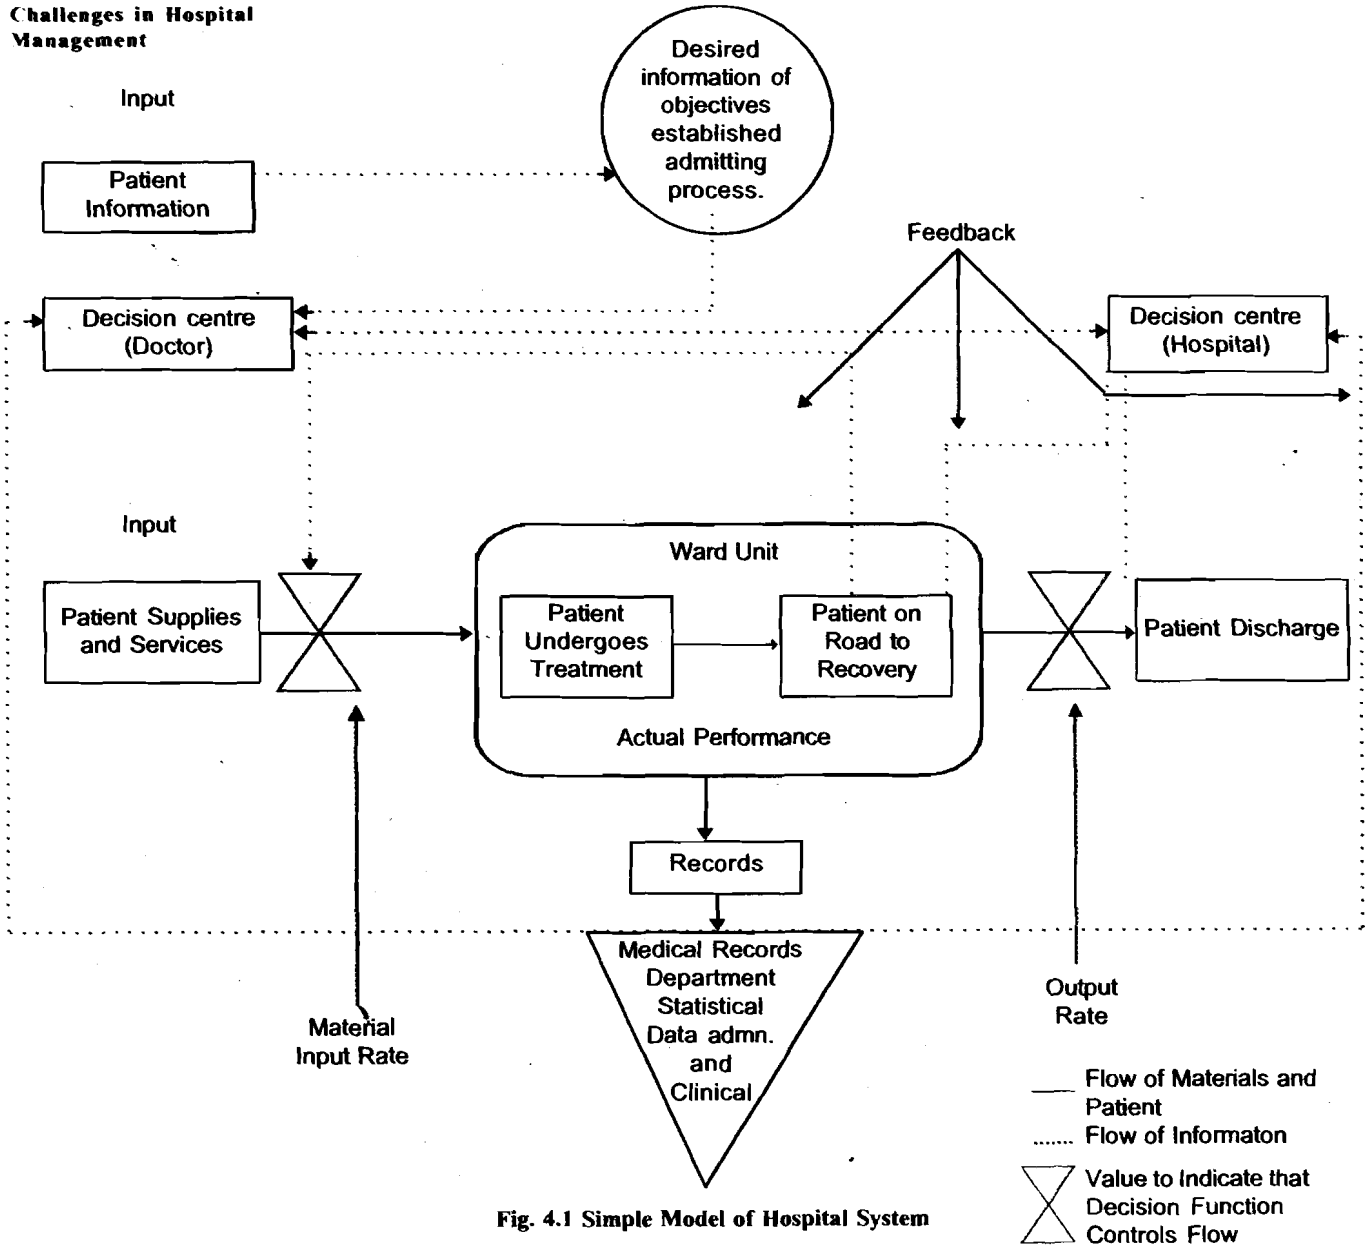

Fig. 4.1 Simple Model of Hospital System

- Importance of customer which has been sub-divided into external and internal customer. In the case of hospital the external customer is the patient or his relations, whereas the internal customer may be an employee or a department receiving product or service from another employee or department. For example, employees or departments receiving stores from CSSD, Laundry, Medical stores etc. are considered as customers of the issuing departments.
- Utilisation of intellect of the operator : As a matter of fact Japanese have "quality circles" in which all members of the team are invited to suggest improvement of the existing system or working procedures. This shows total involvement of all employees working in organisation.
- "Continuous improvement" is yet another important aspect that the Japanese call "Kaisan". Quality management system incorporates various methods like management review, internal audit and statistical techniques for measuring and assessing the quality of the system on a continuous basis to correct deviations.

You have come across the terms like 'quality control' and 'quality assurance' in the definition of the term quality management.

Quality control refers to **"the operational techniques and activities that are used to fulfil requirements of quality"**. It will therefore be clear that quality control techniques applied in quality management are concerned both in monitoring and evaluation of the system

implemented to eliminate causes of unsatisfactory performance at all stages i.e., during input, process and output stages, in order to achieve standards of quality and economic effectiveness.

Whereas, "quality assurance" is concerned with "All the planned and systematic activities implemented within the quality system and demonstrated as needed, to provide adequate confidence both internal and external customers as explained above that an entity (i.e. service or product) will fulfil requirement for quality".

In fact some quality control and quality assurance actions are interrelated and are complimentary to each other.

The latest terminology used in quality management is "Total Quality Management"(TQM), which has a wider base and is a all pervasive approach to quality management. It is defined as a "management approach of an organisation, centered on quality, based on participation of all its members, and aiming at long term success through customer satisfaction, and benefits to all members of the organisation and to society". You will note that it has the following elements:

- The approach is centered on quality.
- The expression "All its members" designates personnel in all departments and at all levels of organisation structure.
- The strong and persistent leadership of top management and the education and training of all members of the organisation are essential for the success of this approach.
- In this the concept of quality relates to the achievement of all managerial objectives.
- The concept "Benefits to Society" implies, as needed, fulfilment of the requirements of society.
- Total Quality Management (TQM) or parts of it are sometimes called "Total Quality" or "Company Wide Quality Control " (CWQC), or "Total Quality Control" (TQC) and so on.

After going through the concept of quality management system and various terminologies used in this connection, you will learn about the expected effects and benefits of ISO 9000 quality management system.

3) Effects and Benefits of ISO-9000 Quality Management System

i) *Effects*

- Clarity of customer requirement of product or service, as the service is designed based on market study to fulfil customer needs.
- Clarity of roles and responsibilities at all levels through system analysis and process study.
- Clear business objectives and targets and clarity of service to be delivered at each point.
- Control over quality of operations, through decentralised individual check for quality and centralised quality check by quality control team.
- Assurance of quality of supplies and service at all stages–input, process and output.
- Continued Education and training of personnel. This is to ensure that every man remains confident of his capability to provide results expected thereby motivated to work.
- Efficient and effective working methods, as the new procedures and works instruction are based on quality model, prepared by employees themselves.
- Independent Audit of all operations to ensure that the quality system covers all aspects, being implemented in the desired manner, and provide continuous feedback to the management for timely corrections, if required.

ii) ***Benefits***

- Competitive advantage in the market and increase of image and credibility.
- Expanded and continued market share, due to favourable publicity by satisfied customers.
- Higher productivity and profitability proportionate for reduction of cost of operation by improving efficiency.
- Higher potential for growth.
- Baseline information for planning future services and initiating improvement.
- Safeguard interest of both providers and recipients of care, due to improved quality care, and supporting documentation/data base—to meet the challenges in cases of complaints registered with consumer court.

4.4 PRESENT INDIAN SCENARIO

The print media has been repeatedly bringing out the state of the nursing homes as also the public and private hospitals. As per reports public hospitals turn into 'illness factories' and going to the hospital remains a 'nightmarish experience', as can be seen from the following findings:

- Big crowds, long queues
- Confusing maze like layout
- Incomprehensible instructions and tedious procedures
- Casual diagnosis
- Rude physicians, rough handling by sullen staff
- Bribe taking by touts
- Complete absence of accountability
- Unjustified delays
- Gross negligence due to callousness and incompetence
- Malpractice, like un-indicated surgery.

The private hospitals and nursing homes have been labelled as "Shrine to Mammon". Mammon is known as God of Riches. These institutions are thriving in spite of glaring inadequacies in facilities provided therein. As per survey reports on nursing homes in cities like Bombay, Delhi, Calcutta, Patna, Lucknow, Bangalore, gross inadequacies have been noticed with some variation. In Delhi for instance it has been reported that out of estimated 2000 private nursing homes, over 1500 are unlicensed.

Some major centres of learning do have some appraisal activities, such as, periodical publication of statistics relating to patient load, mortality and morbidity; clinical conferences, clinico-pathological reviews, analysis of fatal cases and enquiry into major cases of negligence. These, however, focus on technical aspects, such as, accuracy in diagnosis, investigation reports, treatment regimen and so on. The legitimacy of the diagnostic and therapeutic procedures adopted, related to the cost of care, the problems encountered during the patients stay, the professional and administrative lapses and so on, are never examined in detail for remedial measures.

In general, except a few, the Indian hospitals do not have any quality assurance programme to regularly monitor and evaluate the standard of care delivered.

You will appreciate that considering "the health is a basic human need and right" the hospital Board or Trustee or an Owner of any health institution has the following obligations:

- Moral—Patient interest to be protected
- Legal—Appropriate measures to ensure quality and patient safety
- Contain the cost of care
- Identify inadequacies in the system
- Regulate activities to ensure quality and efficiency by maximum utilization of resources
- Assess effectiveness of delivery of services rendered.

The causes of the present malady are multidimensional and the remedy lies in introduction of quality management system, to provide efficient and adequate services both in quality and quantity, at minimum cost to the best satisfaction of customers and the society.

4.5 ORGANISATION OF QUALITY MANAGEMENT SYSTEM

According to quality guru W. Edward Deming, an organisation should focus not on bad employees but on bad systems. Deming estimates that 94 per cent of all errors are system errors, not employee errors. He further estimates that only 15 per cent of quality.

improvement opportunity lies in focusing on the performance of people, with the remaining 85 per cent of impediments to quality coming from systemic factors that are optimally addressed by involving everyone in the system in the quality improvement activities.

One of the most crucial factors for success of any quality system is the commitment of the top management of the organisation.

At the outset it is necessary to take a decision by the top management that Quality Management System should be introduced in the organisation. Once this crucial decision is taken in consultation with members of the governing body, medical staff and administration, the following steps are necessary before introduction of the quality management programme.

4.5.1 Organisational Analysis

- Review organisations relationship with its external environment. Today, successful health care organisations must be able to anticipate, understand, and proactively and flexibly respond to change in the dynamic health care environment.
- Examine organisations internal characteristics and functions. Excellence in patient care requires state-of-the-art professional knowledge: clinical, Management, Governance and Support expertise; and Competent technical skills integrated and co-ordinated organisation wide to effectively and efficiently respond to patient and family needs. The existing characteristics that is, its strengths and weakness can be assessed through a review of systems, policy, rules and procedures and operational statistical data of each department in the organisation.
- Thirdly, identifying problem areas and analysis of problems to understanding cause and effect relationship. This will help in systematically assessing and improving important functions and work processes and their outcome.

4.5.2 Awareness Campaign and Development of Quality Culture

Corporate culture is the basic pattern of shared belief, behaviours, attitudes and assumptions acquired over time by members of an organisation. Corporate culture impacts on the organisational performance and productivity. For this it is necessary to create a system of values, beliefs and behaviours (individual and team) for the success.

4.5.3 Training

- Training of top management to help them in decision making regarding implementation of the quality system. These senior managers are generally the heads of departments and will subsequently form the steering committee.
- Training of senior and middle level managers who will form the task force on the project team to design and develop the quality system best suited for the organisation.
- Training of all other members of the organisation to familiarise them with the quality system requirements, and their role in its implementation.

4.5.4 Development of Quality Manual

Quality manual is a document stating the mission and vision of the organisations as to the quality, the quality policy and describing the quality system of an organisation (ISO-8402). The document should reflect the following:

- The mission and vision of the organisation.
- The approach of the organisation for compliance of the quality system elements.
- The organisational structure, defining broad responsibilities and methodology of organising various activities.
- The policy guidelines as to how the system would operate.
- The indicator measurement system for measurement/overviews, which involves both routine, ongoing data collection for processes or functions performed by individuals or multidisciplinary teams or groups, as well as time specific, focused data collection.

A self contained measurement system includes important dimensions of performance,

collects data about relevant processes, outcomes, resource consumption, and satisfaction levels, and taps into patients, practitioners, and employee perceptions of quality. The quality cube shown in Fig. 4.2 presents a model for assessing quality that illustrates the relationship of dimensions of performance and important functions to a range of patient populations and services provided. The cube is a tool that can help stimulate thought about, and focus measurements related to, important priorities.

Fig.4.2 below explains the forms of Quality Assurance (QA) studies applying the quality control technique.

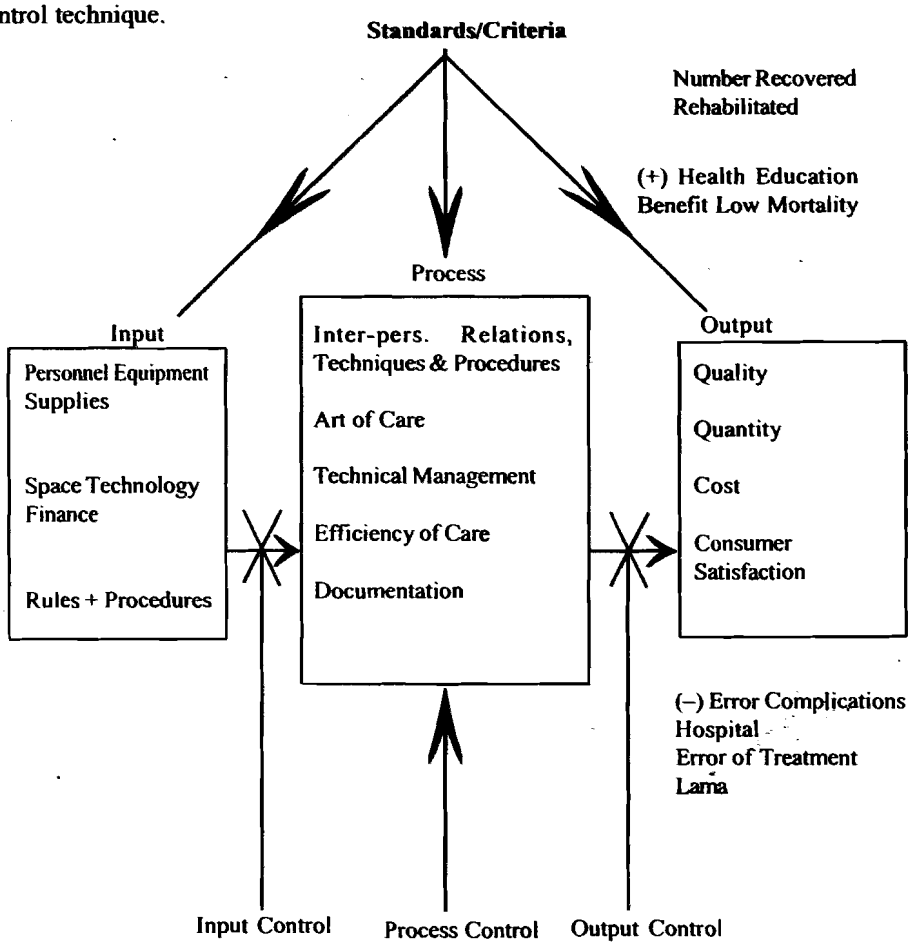

Fig. 4.2: Quality Control (Monitoring & Evaluation—A Tool for QA)

The dimensions of performance, as shown in Fig. 4.2, are patient centred activities involving functions of all the services. Systematic assessment and improvement of performance is a continuous process which involves:

a) Study of problems to identify process weakness and not individual incompetence;

b) Careful co-ordination of work and collaboration among departments and professional groups;

c) Seeking judgements about quality from patients and others and using such judgements to identify areas of improvement; and

d) Setting priorities for improvement of performance of all important functions, and maintaining stability of these functions.

You will now learn about the dimensions of performance as given by JCAHO.

Doing the Right Thing

Efficacy : The degree to which the care (procedure or treatment) of the patient has been shown to accomplish the desired or projected outcome(s).

Appropriateness : The degree to which the care provided is relevant to patient's clinical needs, given the current state of knowledge.

Doing the Right Thing Well

Availability : The degree to which the appropriate care (needed test, procedure, treatment or service) is available to meet the patient's needs.

Timeliness : The degree to which the needed care is provided to the patient at the most beneficial or necessary time.

Effectiveness : The degree to which the needed care is provided in the correct manner, given the current state of knowledge, to achieve the desired or projected outcomes for the patient.

Continuity : The degree to which the needed care for the patient is coordinated among services, practitioners, and providers and over time.

Safety : The degree to which the risk of an intervention and risk in the care environment are reduced for the patient and others, including the health care providers.

Efficiency : The relationship between the outcomes (results of care) and the resources used to deliver patient care.

Respect and Caring: The degree to which the patient or a designee is involved in his or her own care decisions, and to which those providing services do so with sensitivity and respect for the patient's needs, expectations, and individual differences.

4.5.5 Development of Hospital Information System

The framework of the hospital information system should be so organised that there is rapid and regular feedback of information, related to the quality of patient care rendered by clinical departments and also overall performance of all services including Supportive, Utility and Business Services of the organisation.

The information based upon the "hospital" is called the "Hospital Operational Statistics" which can be grouped as under:

- Resources of the hospital, e.g., bed, diagnostic and therapeutic facilities, staff available, supportive services etc.
- Utilisation of hospital resources including statistics of:
  - —Patient movement, days of care, bed occupancy etc.
  - —Outpatient visits
  - —Operations, deliveries
  - —Number and type of Laboratory and radiological investigations and so on.
- Administrative and Financial Data—organisation and analysis of data required for utilisation review, performance review, cost analysis, patient satisfaction study to assess and improve quality of patient care.

The information based on the "Patient" may be termed as " Hospital Morbidity statistics". The statistical unit is patient and the information is collected from medical records. The report includes:

- Personal characteristics of patients, age, sex, occupation etc.
- Length of stay, overall and speciality wise
- Presence of complications, consultations, infections
- Type of investigations and treatment
- Outcome of hospital stay—Patients recovered and rehabilitated, pre-natal mortality, surgical fatality, mortality for other causes and so on.

As you know the primary source of patient statistical data in hospital is the medical records. Therefore, accurate and complete record keeping and good patient registration system is essential.

4.5.6 Formulation of Criteria and Standards

All measurement requires something analogous to a yardstick. Criteria and standards are the yardstick for quality assessment. The definitions, along with some examples are given in the table below:

A) **Definitions**

Criterion : Attribute of structure, process or outcome capable of leading to an inference about quality.

Standard : A specific, quantitative measure that defines goodness.

B) **Examples**

		Structure	Process	Outcome
Criterion	:	Staffing of Intensive Care Unit	Blood Transfusion during surgery	Casefatality
Standard	:	Not less than One RN per two occupied beds	Not less than 5% not more than 20% of average cases	Not to exceed 0.1% for a specified procedure.

Criteria and standards may be derived in two ways: (a) "normatively", which means from the scientific literature, supplemented by the opinions of recognised experts, and (b) "empirically" which means, from examples of actual practice or behaviour.

4.6 APPROACH TO MEASUREMENT OF QUALITY

The measurement of quality of care or service poses many problems as it is not possible to establish accurate standards of judgement. Yet we need to have some indicators, i.e. some kind of criteria and standards for evaluating the service; only then the efficiency of performance and in turn the community benefit, can be assessed for further improvement.

In health care for the purpose of measurement of quality one needs to look at the entire process, including the resources available, the setting in which the care is rendered, the process of delivery of care, and the competency of those delivering the care. Therefore qualitative studies include studies of structure, process, and outcome of care. Quality study of factors influencing quality care may be termed as "Resource Utilisation Study" and actual performance appraisal may be termed as "Professional Activity Study" for evaluation of quality care.

4.6.1 A Framework for Measurement of Quality

"Structure" deals with the resources associated with the provision of care and indirectly influencing quality care, such as:

i) Beds: number available and their utilisation

ii) Personnel: adequacy, qualification, level of motivation etc.

iii) Equipment: adequacy, state of repairs/replacement

iv) Supplies: adequacy, supply breakdowns, pilferage

v) Space: does it meet minimum standards, state of maintenance

vi) Rules and Procedures: available or not for all areas

vii) Technology: appropriate or not

viii) Finance: adequacy, proper allocation and utilisation

"Process" aims to analyse the practice of care delivery. In clinical areas, it involves direct observation of patient care and studies based on medical records (professional service review).

i) Physician-patient interaction
   —Art of care
   —Technical management of care i.e. proper utilisation of diagnostic and therapeutic facilities
   —Efficiency of care relates to overall management of patients' problems consuming minimum resources.
   —Documentation

ii) Interpersonal relations—conflicts, grievance procedure

iii) Techniques and procedures—available and appropriate

In other areas, such as, supportive and utility services, it is necessary to study the legitimacy of methods adopted to achieve the end-result.

"Outcome" Studies emphasize the results of care:

i) Quality of work done—how good is the service;

ii) Quantity of work done—is it optimal, minimal or maximal;

iii) Cost of care to the patient and the cost of hospital operation;

iv) Consumer satisfaction with the type of attention received.

In outcome related to quality care the credit points are, number of lives saved, number recovered and rehabilitated. Debit points are, deaths, complications due to drugs or procedural errors, hospital infection and so on.

4.8 LET US SUM UP

In this unit you have learnt that considering the rising consumer awareness and expectations, and the escalating cost of health care, the health organisations can no longer remain insensitive to the need of quality management. Introduction of quality management system in any health establishment, be a small or large, will be of considerable benefit to the provider of care, and to the patient and community, as it ensures delivery of efficient care of quality and quantity, at minimum cost, to the satisfaction of customers.

Further you have learnt that the quality management system can be introduced at no cost or minimum cost, depending on the quality policy and approach, provided the organiser of care is able to (a) design a mechanism for proper selection and training of all categories of staff, (b) develop a quality culture related to cost, (c) maintain good medical records, and (d) introduce a framework for hospital information system capable to meet the user requirements in the system.

You also learnt that prompt attention to patients, courteous behaviour by staff, providing reassurance and comfort to patient in a clean and safe environment, will provide best satisfaction to the consumers of care at no cost.

Subsequently you learnt that the productivity of a hospital can be increased while maintaining the quality, through the following steps:

- Manpower utilisation— right man for the right job, and ensuring doing right things well.
- Maximum use of diagnostic and therapeutic facilities and maximum bed occupancy, through dynamic marketing strategy.
- Quality versus cost ensure nothing less or nothing more.

- Optimum utilisation of all available resources
- Clear purchase policies, standardisation of equipment and value analysis.
- Enforce inventory control procedures.
- Control overuse, underuse and misuse of resources
- Reduce cost of poor quality, disquality, due to poor performance, non-performance, in clinical and supportive services; such as, wasted x-ray films, unjustified investigations, medication errors, misdiagnosis, hospital infection and so on.
- Develop basic quality standards and criteria for all key performance areas, which may be adopted as indicator for measurement.

Towards the end of the unit you learnt that development and management of information system is an important function focused on meeting the organisation's information needs. Its goal is to obtain, manage, and use information to enhance and improve individual and organisation performance in patient care, governance, management and support processes.

4.9 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) i) 5th Century BC
   ii) 2nd Century AD

2) i) Medical Audit
   ii) 1918.

3) i) Joint Commission on Accreditation of Hospitals
   ii) Joint Commission on Accreditation of Health Care Organisations
   iii) Bureau of Indian Standards
   iv) International Organisation for Standardisation

4) American College of Physicians. American College of Surgeons, American Hospital Association and American Medical Association.

Check Your Progress 2

1) a) Reassurance and advice
   b) Quality of Care and Cost of Care
   c) Promotive and preventive Care
   d) Personal attention

2) a) Quality of direct medical service, as diagnosis, treatment etc.
   b) Appropriateness of indirect operations, such as, housekeeping, linen, stores, administration etc.
   c) Quality of utility services, such as, food, housing, safety, security, attitude of employees and so on.

3) Patient perspective issues, acceptability, continuity, effectiveness, equity, efficiency, efficacy and timeliness of care.

4) The whole emphasis is on making available care of an acceptable standard as per needs of each patient, at the least cost. This could be achieved by:
   a) emphasis on preventive care
   b) allocation of right job to right person
   c) efficient utilisation of resources
   d) Cost monitoring and cost management

Check Your Progress 3

1) It is only a tool, which the administrator can use to correct the disorganised resources of men, machines, materials and money into a useful and effective institution. Management is the process whereby those unrelated resources are integrated into a total system of objective accomplishment.

2) a) to achieve, sustain and improve the quality of product or service
   b) to assure the management that internal controls are effective.
   c) to assure the customer that the service conforms to his requirement.

3) a) maintaining quality through checks individually and centrally.
   b) customer oriented service
   c) utilisation of intellect of the operator- e.g. 'quality circle'.
   d) continuous improvement.

4) a) Increase of image and credibility
   b) Higher productivity and profitability
   c) Higher potential for growth
   d) Baseline information for planning of services
   e) Safeguard interests of providers and recipients of care.

Check Your Progress 4

1) a) Normal
   b) Legal
   c) Contain cost of care
   d) Identify inaccuracies in the system
   e) Regulate activities to ensure quality and efficiency
   f) Assess effectiveness of services rendered.

2) a) Organisational analysis by reviewing external environment, examining existing characteristics of internal organisation to ascertain strengths and weakness, and thereby identifying the problem areas for detailed analysis of cause and effect relationship.
   b) Awareness campaign and development of quality culture
   c) Training of all managers and other members of staff
   d) Development of quality manual
   e) Development of Hospital Information System

3) a) Efficacy
   b) Appropriateness
   c) Availability
   d) Timeliness
   e) Effectiveness
   f) Continuity
   g) Safety
   h) Efficiency
   i) Respect & Caring

Check Your Progress 5

1) One should look at the entire process, including, the resources available, the

setting in which the care is rendered, the process of delivery of care, and the competency of those delivering the care.

2) Beds, personnel, equipment, supplies, space, technology, rules and procedures, and finance.

3) At the level of (a) input, i.e. the quantity and quality of resources made available, (b) process i.e. how efficiently the resources are utilised for delivery of care, and (c) output or outcome, i.e. checks and measures applied to ensure quality at the time of final disposal of the product or service.

UNIT 5 RESEARCH IN HOSPITAL ADMINISTRATION

Structure

5.0 OBJECTIVES

After going through this unit, you should be able to:

- define the research and enlist its types;
- describe the various models of research;
- enlist the pre-requisites for conducting research;
- describe the steps in conducting a research;
- explain the purpose of research; and
- identify the areas of research in the field of hospital administration.

5.1 INTRODUCTION

In this unit you will learn about the importance of Research Methodology in Hospital and Health Care Management. You will appreciate that the concept of Research Methodology is an important prerequisite for analysis of the problems, planning and operation of the health care system and hopsital organisation. You would further learn about the concept and definition of research. You will also learn the application of research in hospital and health care management. Towards the end you will learn conduction of research and its documentation and report writing, what is research, how is it applicable in hospital and health care management and how to go about conducting a research, as well as its documentation and report writing.

5.2 EVOLUTION OF RESEARCH AS A METHOD OF STUDY

Until about **2500 BC** people acquired knowledge by observing the nature and facts. The observation were explained merely in acts of the God or other supernatural power. The first attempts to supply rational explanations for their observations were made by the **Greeks**.

Their **hypothesis** appears naive today but it must be borne in mind that our present hypothesis which appears very sophisticated today will not be so impressive 2,000 yrs from now. The importance of a Greek hypothesis lies not in its correctness but the break through in the approach to research from traditional explanations.

The evolution of scientific research was initiated by the writings by **Hippocrates (460-370 BC)** but thwarted by those of **Plato** and **Aristotle**. They allowed the development of rational hypothesis but prevented the appearance of the third step of scientific research, i.e. **experimentation**. And the Greeks remained, in general, theoriticians and they did not verify their theories by experiments.

Experimentation, first appeared on the scene with **Archimedes** in 287-212 B.C. He was the **first experimentalist**. However, the birth of **modern science dates back to 1543** – the year of the publication of **Copernicus**, "The Revolutions of Heavenly Bodies" and **Vesaliuis**, "The Structure of Human Body", the two monuments to mark, the beginning of modern science. From then on the growth of modern science was continuous and rapid and the work of **Galileo Galilei** (1564-1643) provided a final direction which modern science and scientific research was to take.

Check Your Progress 1

Fill in the blanks:

1) Evolution of scientific research was initiated by .....

2) .....was the first experimentalist.

3) Birth of modern science dates back to year.....

5.3 CONCEPT AND DEFINITION OF RESEARCH

You must be knowing that research is a systematic enquiry, seeking facts through objective verifiable methods in order to discover the relationship among them and to deduce from them broad principles or law. American Public Health Association, in 1962 has defined "Research as a systematic study to describe facts accurately to develop common principles, to put these principles into practice and finally evaluate the results." The emphasis may be observational, to develop new hypothesis or experimental, to test such hypothesis. In new areas observational studies predominate until enough facts emerge to form testable hypothesis.

Professor **Clifford Moody** said, "It compromises defining and redifining problems, formulating hypothesis or suggested solution; collecting, organising and evaluating data; making deductions and making conclusions; at last, carefully testing the conclusions to determine whether they fit the formulated hypothesis."

To put it in a simplifed way—research is essentially an attitude of mind and the application of a technique in confronting a problem. This attitude is synonymous with an open mind, whether in collecting facts or interpreting them, i.e. a mind with the maximum possible freedom from prejudices and preconceptions.

5.4 PECULIARITIES OF RESEARCH IN HOSPITAL ADMINISTRATION

Problems peculiar to Research in Administration partly in the **scarcity of testable hypothesis** and partly in the implication that the findings of such research **should be rapidly applied** to the programme under study. To solve the first problem, many initial administrative studies must be descriptive in order to develop testable hypothesis; then the planned experiments may follow. Possibly, the second problem will be solved only by compromise. If we aim seriously at producing new knowledge, investigators may have to be satisfied when their results are applied to other similar programmes rather than the programmes under study. Valid administrative research may create human stresses that prevent findings being applied by programme directors who have been disturbed by the resutls. The alternative course, of converting the project into attitude—changing exercise, often produces findings of little general value.

Unlike the researches in other subjects which derives its prestige largely from occasional new discoveries which advance the level of knowledge, the **administrative research raises questions like**:

- **What is the cost involved** in conducting the research?
- **Who would be benefitted** and by how much?
- Whether the output from this particular research would outweigh the inputs i.e. **efficiency and effectiveness** of the study.
- How much is the **practical implication** of the topic chosen?
- Are the users **competent to use the techniques** suggested?

The **application of research methods to administration involves the following problems:**

- The **definitions, assumptions** and other parameters that are **not clearly defined.**
- Many **variables are difficult to hold constant**. Thus, findings may be unrealistic when taken out of context.
- **Few testable hypothesis** have been stated. In beginning a programme of administrative research, one should first define some reasonable area for study, then develop methods for measuring the effects of the programme under study.

5.5 PURPOSE OF RESEARCH IN HOSPITAL ADMINISTRATION

Before discussing the purpose of research in Hospital Administration you must understand the goal, objective and the philosophy of Hospital Administration in contemporary socio-economic scenario.

Research in Hospital Administration is **concerned with the way in which hospital services are provided** and with all factors that have bearing on providing these services. Administrative research **develops new knowledge** about institutions, programmes, operations, the people working in these activities, or the individuals or communities served by them. Administrative studies in the hospital focus primarily on these subjects, while diseases and patients tends to be side issues, sometimes acting as **yardsticks** for identifying the success and failure of patient care. Human behaviour and motivation, the economic results of programmes, **the pattern and consequences** of administrative decisions, the collection and interpretation of diseases, statistics, physical facilities **operational management** are all among the many facets of Administrative Research.

Administrative Research also aims at **developing norms, standards** and a series of gradual prescriptions against the shortfalls of Hospital Management. Such prescription in earlier years were based on long experience and at times on common sense which does not withstand the test of time. Particularly, into ways of scientifically-derived principles in administration. **The goal of Administrative Research, therefore, is to plant new scientific principles among the empirical foundations.**

5.6 TYPES OF RESEARCH

The types of research can be **distinguished according to the degree of abstract thought underlying them.** There are three types of research:

Discovery of Facts

In this type gathering of facts is the dominant objective as in social surveys. It **utilises the "Primary Data"** (first hand colection of data) techniques e.g. Rural credit survey of the Reserve Bank of India.

Interpret Already Available Information

This largely inteprets already available information. It is bibliographical in approach i.e. **makes use of "Secondary data"** (assimilation of data collected by other investigators). Emphasis is more on analysis and interpretation of existing information.

Research in Purely Theorising Type

The essence of this type is building up of higher reaches of pure theory based distantly upon Primary and Secondary data and some times on the basis of pure reasoning.

Research planning in health departments tends to originate in two ways:

- The **solo approach**, where individuals attack specific problems and carry out research independently of other health department operations. In a large department, it may eventually result in a central coordinating mechanism to eliminate the duplication of research activities.

- The **integrated approach** where a small team is employed to stimulate and help others develop research projects which may be closely related.

5.7 COMPONENTS OF RESEARCH

Research as you know in any science and of any kind has some broad features. Some of these are presuppositions, forming the permanent framework of any type of study and others are the varibale framework related to particular sciences or groups of sciences. You will also appreciate that the **permanent framework of any research uses symbols, often mathematical and the logical processes.** These approaches aims at:

- giving precision and effect a saving in time and energy
- standardising and systematizing the thinking process
- describing the objects themselves and relation between them
- publication of results obtained and techniques employed.

This means the fundamental article of faith of scientific research lies in Objectivity, Reproductivity, Validity and Reliability. That is, the **sine qua non feature of any research is**: Each one of these can be explained as follows:

Objectivity : It is the unbiased devotion to look for facts and to establish the truth.

Reproductivity	:	It means that the results obtained in the study are same if two different researchers apply the same methodology independently in similar circumstances.
Validity	:	It means the method involved in the research evaluates what it is intended to evaluate.
Reliability	:	This refers to the internal excellence of a method used in a research project.

5.8 CATEGORIES OF RESEARCH

You must be knowing that all researches can be categorized into two i.e. the basic research and the applied research.

5.8.1 Basic Research

It is the search for basic principles and synthesis without any immediate utilitarian objective. It arises from a instatiable intellectual curiosity like that of i.e. Einstein's theory of relativity. Basic research resembles "Sowing" of Seeds and its path radiates".

5.8.2 Applied Research

It is associated with particular projects and problem oriented. It relates to current activity and practical situations e.g. field survey techniques in market research. Applied research resembles "harvesting" and it follows the path of convergence. All administrative researches are of applied variety and basic research has its limitations in administrative issues.

a) ..... resembles "sowing" of seeds and its path radiates.

b) All administrative researches are..... variety.

5.9 MODELS OF RESEARCH

In this section you will learn about different models of research. There are five models of research:

1) **Problem Oriented Model**

This requires the knowledge of entire configuration of the problem and of the different possible research devices that might help the analysis. The second fact which is emphasised is that the broader the purpose and wider the problem; the more composite the tool should be.

Behavioural sciences such as psychology, sociology, social anthropology and public relation issues of administration are problem oriented method of research, particularly in the hospital and health care administration.

The model verifies general propositions, use carefully refined concepts and do not attempt predictions.

2) **Method Oriented Study**

The documentary sciences such as history, law and political science deal largely with method and study of documents. Method oriented study explains unique events or situations, utilise common language, though in a refined and careful way, and attempt to predict by comparing cases.

3) **Scientific Method of Research**

The scientific method pursues the path of systematic analysis of doubt and is not satisfied with psychological certitude, and remains ready to abandon a theory when the facts so demand.

It is a collective term denoting the various processes by the aid of which the sciences are built up. In a wide sense any method of investigation by which scientific or other impartial and systematic knowlege is acquired is called a scientific method.

The scientific approach has two components:

- **The procedural components** are observation, hypothesis and verification. **Observation** is something, on which a hypothesis is built, is itself based on data currently available to the researcher before he begins his investigation. Such a knowledge depends on the available literature and personal observation as well as researcher's hunches, if any.

  The **Hypothesis** which is described later, is a tentative conclusion based on inadequate and necessarily vague observational data. Its main purpose is to guide the collection and processing of facts and to indicate the direction of investigation. All the succeeding steps in the investigation centres around the verification of the hypothesis.

  Verification, the third step, in the most crucial step and forms the core of research and the scientific approach. It comprises of four different facets, namely, collection, analysis and interpretation of data leacding to hypothesis testing and the generalisation.

- **Personal component** relates to the researcher's knowledge of the field he investigates so that he should know broadly where to find the data. As you know and has been said by **Eigelbarner** "one needs the scientific imagination to construct hypothesis, the analytical ability to devise crucial experiments to test the hypothesis, the resourcefullness, persistence to carry through the experiment, the perspective which distinguishes the essential from the non-essential and the reasoning which coordinates individual facts into a principle".

This is known as **scientific attitude** which depends on:

Professional qualities (i.e.) the knowledge, training and devotion for the subject.

Personal qualities (i.e.) the ability to assess the adequacy, relevance and value of data.

Integrity (i.e.) honesty, sincerity of purpose and truthfullness.

These qualities are essential in a researcher.

4) **Descriptive Method of Research**

This is the simplest and method applicable to a number of social problems especially in under developed countries. It is essentially a fact finding approach related largely to the

present, and abstracting generalisation by the cross-sectional study of the current situation. It comprises mainly of collection of data; however, mere collection is not research unless there is adequate interpretation in the form of elaboration of casual connection, the descriptive method to some extent also interprets the data.

This is extensively used in physical and natural sciences, for instance, when physics measures, biology classifies, zoology disects, geology and administration studies, as in socio-economic surveys and job and activity analysis in administration.

5) **Historical Method of Research**

The word is self explanatory. It is the study of the past and its casual relation to the present. This is an important method of research in social science where the history has impact on the present and future social cultural structure. It is useful to analyse the past to have a vision of future and make prediction of discussing opinion.

However, the limitation here is the more distant the past, the greater in the difficulty to get the relevant facts. Secondly, neither the data or the inferences are capable of verification and repetition. Thirdly, calculation and measurement as in statistical studies are not possible in this method.

So, after understanding the various methods and models of research it is evident that scientific method of research in the ideal method. Therefore, in the subsequent section we shall be discussing only the scientific method of research.

5.10 PREREQUISITES TO CONDUCT A RESEARCH

Before you can conduct a research, there are certain prerequisites. They are:

- Selection of a problem
- Review of literature to:

  —find the resemblence of work carried out previously.

—understand the problems encountered by the precedor ?

—find out alternatives to overcome the problems

—avoid the mistakes committed by the predecessor

- to develop a hypothesis
- to define the tools and techniques which will be used while conducting the research
- to test the validity of the tools.

You will learn about these prerequisites in detail in this section.

1) **Selection of the Problem**

This is the analysis of problem from all sides and to understand it in broad prospective. While selecting a problem, the points to be kept in mind are as follows :

i) **Practicability:** It is to assess if the time and energy spent on a particular project is worthwhile or not.

ii) **Urgency:** All problems leading to investigation are, no doubt, important but some are more so than the others. Therefore, one must assess the relative urgency of alternative projects.

iii) **Utility:** This is to see, how useful the project would be for the organisation to reach the organisational goal.

iv) **Anticipation of problem:** It is to foresee problems, leading solutions which would fit into immediate future. This requires a great deal of experience in judging the current situation and its repercussions and also imaginative assessment on the part of the investigator.

v) **Resources (tools and techniques):** Research project is conditioned by types of facilities available. These resources relates to the tools and techniques used.

vi) **Available information:** This is another facet of resource, which relates to the evidence or information that can be found before starting a project which needs to be verified with the data collected.

vii) **Field of specialisation:** For the efforts to be effective and its findings accurate, comprehensive and meaningful research must concentrate on a particular, though broad, area of knowledge.

viii) **Administrative consideration:** The incidence of administrative work depends on the size and nature of the project. The organisation must balance administrative burden of the enquiry against the large component of technical personnel.

ix) **Equipment:** The resources needed for sorting, tabulating, processing etc.

x) **Operation funds and miscellaneous considerations :** Operation funds is the working capital necessary for operational purposes.

Miscellaneous includes the size of problem to be investigated and the consideration in terms of resources as well as the time needed for effective conclusion of the research project.

2) **Review of Literature**

After defining the problem, a preliminary review of literature is carried out. This is to note the similar work resemblances and to get guidance for developing the plan of action.

3) **Final Statement of Problem**

After completing the first two steps the researcher can focus readily on real issues involved.

This is to define the problem clearly and precisely to avoid getting involved into newer problems.

4) **Developing a Hypothesis**

Now a tentative assumption is made based on inadequate and necessarily vague observational data. Its main purpose is to guide the collection and processing of facts and to indicate the direction of investigation and to prove whether the assumption is right or wrong. Hypothesis need not be documented always, however, it is always necessary to proceed with the study.

Types of Hypothesis

a) Null hypothesis : neutral hypothesis

b) General hypothesis : purposeful hypothesis

c) Complex hypothesis : interrelation of multiple variables

Criteria for Good Hypothesis

1) Conceptual clarity

2) A moral, empirical, reference word i.e. should, bad, good etc. words should be avoided

3) Specific and precise

4) Relevant techniques

5) It should be related to the tools of the theory

6) Design of study: A good design can characterise a good hypothesis. Design of study depends on:

—The tools of technique which have been finalised.

—The decision of the time frame within which the study would be conducted.

—How much the hurdles have been anticipated and logistic limitations therein.

5) **Secondary Review of Literature**

Once the problem is defined and working hypothesis is finalised the actual study begins with the detailed review of literature i.e. the secondary review of literature. This is to have a detailed study of the work of previous investigators who have addressed the similar issue and to understand the problem in a better way, so as to reduce the wastage of time.

6) **Tools and Techniques**

The tools of collection and analysis are the available techniques at hand and should be used wherever possible as checks and counter checks.

Facets of a good tool are:

- It helps in collecting a comprehensive data which is correct, consistent, objective and uniform recording of concrete relevant details.
- It should not be generalised enquiry of details.
- Concepts are clearly defined in a good tool of enquiry.

All the above qualities depends upon the variety, appropriateness and accuracy of the observational and measuring devices.

7) **Testing the Validity of Tools**

It is done through a pilot study i.e. a trial run of the actual project.

Check Your Progress 5

.....

.....

.....

5.11 STEPS IN CONDUCTING THE RESEARCH

After you have defined the problem, made a hypothesis to work on, designed the tools you would be using and seen into the history of the subject about the type of mistakes your predecessors have committed, you should consciously make an effort not to commit the same mistake and start on with your actual work.

Your work starts with :

- Data collection
- Analysis and interpretation of data
- Verification and proving the hypothesis you have defined earlier
- Writing the report
- Making recommendation which can be used practically

1) **Data Collection**

Data is the raw, unprocessed details which is collected during the course of study. The data collecting tools and techniques are:

a) **Survey**: It is a fact finding study.

b) **Interviewing**: It is the conversation with a purpose and therefore is more than a meagre oral exchange of information. It is usually direct and is the only way by which certain types of information can be obtained.

c) **Questionnaire**: It comprises of a series of questions to a person who can give the information required without the need of any personal contact i.e. the interviewing technique.

d) **Observations**: It comprises of recording of data, as they come to the investigator's notice when he plays largely a passive part. It consists of collecting facts in direct knowledge of the investigator. It depends on three qualities of the investigator—sensation, attention and perception.

Observation is of two types :

Controlled and non-controlled type : The latter is characterised by the absence of any attempt to use precision instruments to measure and record facts and to check their accuracy. Mechanical aids are not used, and data are collected without standardising procedure and without resorting to a random sample.

Participant and non-participant type : Both controlled and non-controlled observations could be of the non-participant types. In the latter the observer keeps himself outside the situation he is studying. For example snap shots taken by a tourist rather than a studio photograph. This is less accurate study of situation and does not enable penetration behind the apparent.

While, by and large, participant observation is more accurate and dependable. Its operability depends on the particular situation and the problem at hand.

2) **Analysis and Interpretation of Data**

After the raw material is collected, it is put in a systematic form e.g. tables, bar diagrams etc. Now in this systematic form it becomes easy to analyse details and interpret the data. This becomes an **"information"** for the researcher which he can document and use in drawing conclusions and making recommendations.

3) **Discussion**

Once you have interpreted the data, the next step is to discuss the results. It should highlight two aspects:

- Bring out the implications of the data.
- Establish continuity in the scientific knowledge between what was already known to what has been now added or rejected.

There are thus three aspects being incorporated in discussion:

a) **Interpretation**: This is, how can one explain what has been done and what was observed. Irrelevant findings should be omitted and the important factuals should be put statistically to support the original hypothesis beyond doubt.

b) **Disputation**: This is how one's work fit into the general body and knowledge of the subject? This is where references to the published work will come. The chain of others can be discussed and unsettled issues if any, can be stated.

c) **Disquisition**: This defines what are the implications of one's work for disciplines and how they might affect current practices? This in the section for opinion, philosophy and a little theory, some of which may alert another investigator to plan further experiment or a purpose of new hypothesis.

4) **Verification of Hypothesis**

Once the analysis and interpretation of data is done it automatically verifies whether the hypothesis with which we started the study is right or wrong. This further helps in result generalisation. It forms the core of a research project.

5) **Conclusion**

After the work has been completed the study in concluded. Most of the results of scientific study falls in the following categories :

- The conclusion agrees with what everybody already knows.
- The conclusions sustain ideas and views suspected to be true for which there was previously little corroborative evidence.
- The findings are entirely new and have not been thought of before. Fortunate indeed is the author whose work comes into this category.

6) **Summary**

A summary of the investigation is highly useful. Its purpose is to enable the researcher to

and findings. The summary in a brief resume of the major findings, conclusions and recommendations. It should faithfully reflect the earlier phases of the investigation. No idea or fact is introduced in the summary.

7) **Writing the Report and Recommendation**

Research reporting is the oral or written presentation of the evidence and findings in such detail and form as to be readily understood and assessed by the reader to enable him to verify the validity of conclusion.

This requires considerable thought, effort, patience, skill and penetration and overall approach to the problem, data and analysis as well as firm control over language and greater objectivity.

There are three types of written report:

a) **To the layman**: This is intended to disseminate the broad facts, findings and recommendations. It must be particularly lucid, simple and yet dignified, scrupulously avoiding distortion, jargon and technical camouflage.

b) **Report to the administrator**: This should be of medium size, with some technical details and supporting data followed by a summary and principal recommendations. The language in this should lean towards simplicity and directness with technical terms and jargon interspersed a little.

c) **Technical report**: This is meant for fellow professionals. The four important facets of technical report are:

   i) The problem and its nature
   ii) Method and scientific accuracy
   iii) Data and dependability
   iv) The logical relationship of data and its interpretation

   Technical report can be presented in four different types:

   i) Detailed report
   ii) Monograph
   iii) Article
   iv) Full technical report

8) **Dissemination of the Report**

Although this forms the tail end of an investigation, it should begin much earlier. Infact, there are two stages of dissemination :

i) During the investigation
ii) After data collection, analysis and interpretation

The major factors influencing a good write up are:

i) The reader's view
ii) How technical the problem is ?
iii) The researcher's hold over his facts and techniques
iv) His command over language
v) The form and fullness of the notes.

The writing may have to be done quite a few times:

a) **First draft**: This concentrates on substance i.e. fullness of facts, accuracy of facts, coherence or logic of facts, movement or transition of facts.

b) **Second draft**: In the second draft the researcher concentrates on form and language.

c) **Third draft**: This is the final draft. It concentrates namely on the finish and final touches i.e. on documentation and polish to make the report weighty, authoritative, convincing and attractive.

9) **Documentation**

in order to decide whether the information is valuable for his own investigation.

However, in research reporting the word has a different meaning. It indicates the references to the sources, other previous and current work and views additional data and discussion, and suggested further reading on the specific problem. In other words, it is, on one hand, evidence of thoroughness of investigation and on the other, a guide to further work.

Documentation has five components :

i) **Footnotes**: This is the most important component of a document. It is cited below every page. It serves the following purpose to:

- acknowledge facts and ideas borrowed.
- provide reference of the source which may be consulted.
- illustrate statements not relevant to the text.
- acquint reader with larger context of the problem.

Usage	Explanation
1) Alfred Marshall : *Principles of Economics*, p. 305., Macmillan and Co.: London, 1921.	First citation of a "book" Cite the page. Give preferably place, edition volume and date of publication. Underline (italicise) the title of book and not that of author.

ii) **Bibliography**: This contains information about books, reports, articles and other sources relevant to investigation.

How to present ?

- Make the list, alphabetically.
- Put the surname of the author first and then his personal and other names.
- Capitalise all important words in the title and italicise the full title.
- For articles, italicise the name of the journal and not the title of the article which must be within inverted commas ('.....'). Invariably mention the pages in the journal.
- If the author is not known, put it under the first important word of title.
- Mention also date of publication, publisher, edition, volume, pages etc.
- It is to be included at the end of each chapter or part at the end of the completed report. e.g. Pautine, V. Young: *Scientific Social Surveys and Research* Prentice Hall: N.Y., 1951.

iii) **Tables, Charts and Graphs :** This is very useful when the investigation is statistics based. Some useful points to bear in mind while making them are:

- Be selective and discriminative in introducing tables and charts.
- It should be able to put the voluminous data in a compact form.
- It should be self explanatory.
- Better limit each table in a single page.
- Do not repeat in table whatever is in the text and vice versa.
- Space tables to facilitate reading.
- Avoid statistical sophistication.

iv) **Quotations**: They are opinion and facts which may be cited to support the investigators own finding. It can be in original language or in translation with or without the original passage.

v) **Appendices**: They are useful for placing cumbersome material, breaking the continuity of

main text. They are not dumping ground for irrelevant materials, rather are either technical or non-technical informations. Under technical head, 3 types of material are included.

- discussions of particular techniques
- elaboration of concepts, terms, definitions
- mathematical deviations and formulae
- additional graphs and charts.

The non-technical appendices are more numerous and common. They include:

- Information useful and relevant but too elaborate for the text.
- Raw on supporting data and lengthy tables
- Lengthy quotations
- Forms of questionnaire, schedules, interview forms etc.
- Sometimes bibliography is also included.

5.12 AREAS OF RESEARCH

Until now you have learnt what is research, what are the methods, prerequisites and steps in research. You have also learnt about the peculiarity and purpose of research in hospital and health administration. In this section you will learn about the Medico Administrative areas where research can be conducted. These are:

i) Hospital planning and architectural studies

—Planning of CSSD, Laundry, Blood Bank

—Planning of OPD, Ward, OT and ICU Services

ii) Utility service studies

—Organisation and layout of Dietary, Linen and Laundry services.

iii) Supportive service studies

—Organisation and layout of Blood Bank

—Medical Record, Pharmacy and Mortuary.

iv) Study of services provided in clinical department

—Study of emergency services department

—Study of psychiatry, ENT, Eye and General Surgery services.

v) Disaster management studies

—Study of existing prehospital services in a particular zone of the country

—Study of existing disaster management strategy of a hospital.

vi) Study of hospital waste management

vii) Utilisation studies

—Manpower utilisation

—Equipment utilisation

—Bed utilisation

—Inpatient vs. Day Care Procedures

viii) Cost evaluation studies

—Costing of inpatient, OT, ICU Services

—Costing of Housekeeping, Hospitality and OPD services

ix) Patient satisfaction studies

x) Job satisfaction studies

xi) Employees motivation studies

xii) Human resource management studies

—Study of absentism

—Study of employee turnover

—Study on Public Relation vis-a-vis Health services

xiii) Evaluation of hospital and health care services

xiv) Study of employees' health services scheme

xv) Medical ethics and Organ Transplantation

xvi) Financing of health care services

xvii) Study of hospital and health information system

—Role of computers in health care delivery system

—Planning and developing a soft ware package for store management

xviii) Role of hospitals in Primary Health Care.

5.13 LET US SUM UP

In this unit you have learnt the peculiarities, purpose and the scope of research in hospital administration. While studying the categories and the models of research you have learnt

the administrative research is of applied nature and is problem oriented, and follows scientific approach to problem solving. You have also studied the pre-requisites to carry out a research study and the different steps in conducting the same, such as data collection, compilation, analysis and interpretation of data, proving the hypothesis and writing the report with recommendations. You have also learnt the method of documentation in a research study. At the end of this unit some examples of areas of medico-administrative research have been enumerated for your guidance. The list is however not exhaustive. Before initiating an administrative research what you need to remember is that whether the study would be cost-efficient, technically feasible, has practical usefulness and would benefit the organisation.

5.14 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) Hippocrates.

2) Archimedes.

3) 1543.

Check Your Progress 2

1) a) Scarcity of testable hypothesis.

   b) Needs rapid application.

   c) Disturbing results leading to stress.

   d) Talks about efficiency and effectiveness of a particular research.

   e) Many variables are difficult to hold constant.

   f) Cannot be undertaken without any practical implication.

   g) Definitions, assumptions and other parameters are not clearly defined.

2) a) Find the way in which hospital services are provided.

   b) Develop new knowledge.

   c) To find consequences of administrative decisions.

   d) To develop terms and standards.

Check Your Progress 3

1) Type of research can be distinguished according to the degree of abstract thought underlying them:

   a) Discovery of facts

   b) Interpret already available information

   c) Purely theorising type

2) It is the first hand data collected by direct observation or surveys.

3) It assimilates and interprets the data already collected by other investigators.

4) a) Objectivity

   b) Reproductivity

   c) Validity

   d) Reliability

5) a) Basic Research

   b) Applied

Check Your Progress 4

1) a) Problem oriented research
   b) Method oriented research
   c) Scientific method of research
   d) Descriptive method of research
   e) Historical method of research
2) a) The procedural
   b) The personal
3) a) Observation
   b) Hypothesis
   c) Verification
4) a) Personal qualities
   b) Professional qualities
   c) Integrity

Check Your Progress 5

1) a) Practicability

   c) Utility
   d) Anticipation of problem
   e) Resources (Tools and techniques)
   f) Available information
   g) Field of specialisation
   h) Administrative consideration
   i) Equipment
   j) Operation funds and miscellaneous consideration
2) It is a tentative assumption made based on inadequate and necessarily vague observational data.
3) a) Null hypothesis
   b) General hypothesis
   c) Complex hypothesis
4) By doing a pilot study.

Check Your Progress 6

1) a) Survey
   b) Interviewing
   c) Questionnaire
   d) Observation
2) a) information
   b) interpretation, disputation, disquisition
   c) summary
3) a) Footnote

b) Bibliography

c) Quotations and translations

d) Tables, charts and diagrams

e) Appendices

4) a) Observation

b) Hypothesis

c) Experimentation

d) Induction

UNIT 1 BASIC ENGINEERING SERVICES

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- explain the rudiments of hospital engineering services;
- describe the important components and areas needing attention; and
- contribute towards better performance of the facilities.

1.1 INTRODUCTION

The primary duty of any hospital as you know is to care for the sick and suffering so that they regain their health speedily. This function can be carried out with greater effect with the assistance of certain facilities, the foremost of which are the building, water and electricity supplies, sanitation and an excellent environment alround. You would have noticed that state of the art equipment are playing an ever increasing vital role in quick and painless diagnosis and appropriate treatment of the ailment and all of them need engineering services to function at optimum level. The Engineering and Allied Services comprise of the following:

- Civil assets
- Electricity supply
- Water supply
- Steam supply
- Central medical gases, air, and clinical vacuum delivery system
- Air-conditioning and refrigeration
- Non-conventional energy devices
- Workshop facilities
- Engineering services department

Hospital laundry, incinerator and fire protection have been dealt separately.

In this unit, you will learn about the basic engineering services that facilitate efficient functioning of the hospital, such as civil assets, supply of water, electricity, steam, central medical gases, air and vaccum delivery system. Other areas listed above will be covered in the next unit.

1.2 CIVIL ASSETS

Civil assets of a hospital complex consist of the land on which the hospital premises stand, the hospital buildings and several others that serve it, the roads and pathways, and the general environment created around the buildings bounded by the compound wall. It is an accepted practice to consider the normal internal services like electricity supply, lighting, ventilation, water supply plumbing and fittings, public health services, lightning protection as part of the building. "Building including internal services", is a common phrase. Modern hospitals are invariably provided with lifts and dumbwaiters, telephones and communication arrangements, TV and music systems. These can also be considered as internal services.

1.2.1 Land and Siting

A large piece of land will provide the best possible clean environment for a hospital. Presently, economy considerations have promoted maximum utilisation of every bit of land space permitted by laws for building construction leaving least open spaces that do not permit good ventilation. Even Indian Standard states that the total area to be provided for a hospital complex shall depend on the availability of land and recommends for guidance an area of one hectare (10,000 sq. m) for every 25 beds.

Hospitals should be easily accessible to the public and the staff, to supply lorries and fire fighting vehicles. So also, civil amenities like roads, water and electricity supplies, central sewerage system, communication and banking services etc. should be available reasonably

close to the site. A well thought out layout and orientation of the buiidings will reduce air-conditioning and ventilation loads.

1.2.2 Hospital Buildings

Hospital buildings are unique in that they have to shelter and protect a large number of human beings and sensitive equipment, and facilitate their efficient performance under all conditions. They are very costly and this may exceed 50% of the total cost. They are planned primarily to offer the best medical care to patients and best as well as safe working conditions for the staff. In addition, security measures for patients, personnel and the public consistent with the conditions and risks prevailing in the locality of the hospital are also considered. Hospital should provide certain basic amenities to patients and their relatives or attendants. Wastage of space and time in movement from department to department should be curtailed. Hospital building as a whole should be compact with the several departments placed in a functionally correct and operationally efficient manner.

Hospitals are planned in accordance with norms, standards and prevailing laws. Publications of Medical Council of India and Bureau of Indian Standards including the National Building Code contain the guidelines and norms for planning and design of hospitals. Super-speciality hospitals which have sensitivity to outside noise should be sited carefully with the sensitive areas placed farthest from the noise source. Circulation areas such as hospital streets, corridors and passages, entrance halls, staircases and lift lobbies inside hospital buildings can take up as much as 30 per cent of total floor area. They should be wide enough to allow smooth trolley and wheelchair movement. Best materials should be used in construction and the design should curtail noise created by walking, talking, trolley movement, banging of doors and windows and even patient's exclamations during treatment. A ramp and fire escape staircases are provided on the external side of the building. The finishes adopted should be of high quality to obtain good hygienic conditions and reduce maintenance effort.

Areas concerned with Radiography, Brachytherapy, Linear Accelerator, Nuclear Medicine, Cardiac Catheterization, Emergency, Operation Theatre, Intensive Care Unit, Laboratory etc. are given special preference in planning adopting specific norms and incorporating superior and selected materials. Cobalt-therapy or mega-voltage therapy rooms should have entrance doors interlocked with the machine control panel so that the doors cannot be opened when the machines are in use. Radiation Medicine Centre and Division of Radiological Protection of Bhabha Atomic Energy Centre at Mumbai have issued guidelines for starting Nuclear Medicine Laboratory and their prior permission has to be obtained before embarking on such a facility. Planning takes into account such factors as the nature of occupation on all four sides as well as above the roof and below the floor of the treatment zone. Many areas need effective shielding to prevent passage of radiation to outside. Lining with lead and using lead glass for peep windows have to be resorted to in many cases. Nuclear waste disposal has to be managed as per rules. MRI equipment is rated in terms of Tesla (denoted by T) which is a unit used in magnetism. These equipment have a magnetic influence zone inside which use of ferrous materials will have to be avoided. Operation theatres need conductive flooring to prevent build up of electricity and are planned to prevent accumulation of dust in corners and crevices. Even the ENT Clinic needs a sound-proof audiometery room and the Eye Clinic a dark room. The above information gives an idea of the intricacies involved in planning the departments of the hospital.

Hospital Buildings are generally huge in size and are multi-storeyed. Toilet facilities, which have to be provided as per norms, should be judiciously located at several points in all floors and some of them are bound to be in the interior portions. To take out the soil and waste water pipes, vertical shafts should be provided wherein these pipes, as also others like water pipes, are fixed vertically to the inner faces of the shaft walls. Pipes draining rain water from the roof top also run through these shafts.

Drainage piping should not be run hidden above the false ceiling as far as possible. It is best to avoid drainage piping in operation and delivery rooms, nurseries, central services areas, food preparation or serving or storage areas, sensitive areas like costly equipment rooms or electronic data processing rooms (computer rooms) etc. Floor drains should never be present in operating, delivery and cystoscopic rooms. Drain systems of autopsy tables should be carefully planned to prevent splatter and splashing and overflow at all costs.

Only a well planned, executed and maintained hospital will have no fear of cross infection taking place in its premises.

Provision for future expansion and renovation should not be overlooked at the initial planning stages as these are inevitable in the long run.

1.2.3 Internal Electrification and Lighting

Internal electrification supplies electricity for lighting and ventilation purposes, and for socket outlets which are sometimes called as convenience outlets or equipment outlets. One lighting circuit can be loaded with 10 lights and fan points provided their total load is less than 800 watts. Similarly one power circuit can be connected to two 16 amperes socket outlets, each to cater for a 1000 watts load, but the total load of both should not exceed 1800 watts. Power socket outlets should be used with utmost care and it would be better not to load them to the full extent, let alone overload them by equipment of high capacity (like sterilizers or heaters). These circuits are nowadays controlled by miniature circuit breakers (MCB) which trip on overload, but can be switched on after the malady is removed. They have virtually replaced the age old switches having replaceable fuses. Even with this better protection, failure rate of socket outlets is unacceptably high. Use of aluminium cables will reduce the cost, but copper cables provide better contact and continuity and are to be preferred for use in hospitals. For greater fire safety, fire retardant low smoke (FRLS) PVC cables may be used. In hospitals, internal wiring is mostly done in concealed conduits as surface conduits collect dust and dirt and defeat aesthetics. Steel conduit is better than PVC conduit which is susceptible to damages later on if someone drives a nail into the wall. Loose and dangling wires is a common sight in hospitals due to requirement of additional electric points not foreseen at the planning stage, but this should be avoided. If not, the wiring should be done properly as per standard practice.

Miniature circuit breakers (MCB) are extensively used in distribution boards (DB) and care should be exercised to use MCB of the "G Series" type to control circuits which operate "inductive loads" like room (window) air-conditioners, small horse power electric motors (used in pumps) etc.

Hospitals have extensive and varied lighting arrangements. In wards, patients have reading night lights in addition to general lighting. Operation theatre lighting is a case by itself with shadowless operating lights of advanced technology. In the area of influence of MRI equipment the lighting is of special nature. Generally high illumination levels are maintained in all patient areas and even in others like the kitchen and laundry.

With high cleanliness level of luminaries the lights will sparkle providing good illumination levels to dispel gloominess and usher in a mood of cheerfulness in one and all. Hospitals are generally big with hindrances to ingress of natural light. Therefore lights are almost always in use and partial switching off may be possible only in the night time.

Several light sources are available for use in hospitals. They are the incandescent bulbs, fluorescent tubes, mercury vapour lamps, low and high pressure sodium vapour lamps, metal halide lamps and so on. Incandescent lamp is best avoided as it has poor efficiency, short life and more often than not gets stolen. Fluorescent light is a good choice for use almost anywhere and has a long life with better efficiency. The market is flooded with numerous tube light fixtures to suit all purposes. Compact fluorescent lights (CFL) are very efficient and attractive. Mercury vapour lamp does not possess good light rendering and may be considered for use in laundry, plant rooms, workshop, parking lots and such like places. Sodium vapour lamp gives yellowish light and could be used in external surroundings, as its efficiency is very high. Metal halide lamps give good colour rendering with high efficiency, but are quite costly. Its life expectancy is also poor.

Illumination levels for some nursing facilities as per international practice are indicated in the table given on next page.

In places like anaesthesia store, the electrical fittings should be of flameproof category which are strong enough to withstand internal explosions. It is better not to have socket outlets and the like in such a place and to locate all switches outside the hazardous enclosure.

1.2.4 Ventilation

Ventilation is obtained by using ceiling, bracket (wall-mounted) or pedestal fans and by exhaust fans. In air-conditioned spaces, provision of fans is reduced. Combinations of natural and forced ventilation can be adopted in hospitals. For example, natural supply and

Illumination Level		
Area/Activity	**Illumination Values**	
	Lux	**Foot candles**
Administrative: office, medical records, conference room	500	50
Lobby:		
• General	200	20
• Reception	300	30
Waiting area:		
• General	200	20
• Reading	300	30
Corridors:		
• Nursing areas – day	200	20
• Nursing areas – night	100	10
Resident room:		
• General	150	15
• Reading/bed	300	30
• Toilet	300	300
Resident lounge:		
• General	150	15
• Reading	300	30
Resident dining	300	30
Toilet, shower, bath	300	30
Nursing station:		
• General	300	30
• Desk	500	50
• Medication area	500	50
• Corridors – day	200	20
• Corridors – night	100	10
Storage, General	200	20
Utility, clean or soiled	300	30
Dietary	500	50
Examination room	500	50
Physical therapy	300	30
Stairways	150	15
Occupational therapy work tables	500	50

natural exhaust, natural supply and forced exhaust, forced supply and natural exhaust or forced supply and forced exhaust. If no products of combustion or anaesthesia gases or other contaminants are involved, then the following air changes recommended in Indian Standard can be adopted:

Air Changes	
Space	**Air change per hour**
Operation theatre	15 to 20
Wards	8 to 12
Bathrooms, toilets	6 to 12
Kitchen	6 to 9
Laundry	10
Non air-conditioned areas	8 to 10

1.2.5 Internal Water Supply

All hospitals invariably comprise of multi-storeyed blocks and water tanks are placed at judicious locations on top of the roofs to supply water under pressure to assigned locations. These tanks are filled by pumping water into them. Like all storage appliances, these tanks also need periodical cleaning and upkeep. They should have sufficient storage capacity to ensure water supply throughout the day. No tank should exist in unused condition which will lead to water stagnation and deterioration in storage. Distribution pipelines convey water from these terrace-mounted tanks to the water taps and other pre-determined points. They are designed and laid so that water at the right pressure issues forth from the taps. A defective system will cause innumerable hardships like continuously low pressure, low pressure when another tap is opened for use, airlocks, etc. The entire system should be well-balanced so that water at the right pressure is available round the clock on all the floors at all points of use.

A major problem with pressure pipelines is leaks. These are to be considered as serious in case of hospitals. When the pipeline is empty, outside contamination can easily slip into the pipeline and cause havoc. A leaky pipeline inside the hospital building will cause dampness and unhygienic conditions. Moreover, wet floors can give rise to slippery conditions. A pipeline leak should be detected at the earliest and promptly attended to. Pipes showing signs of corrosion should also be changed.

Other problems which give rise to complaints are as follows:

a) **Dry tap:** Inadequacy of water is a major cause that is difficult to overcome. Water conservation, stoppage of leaks and misuse could be of some help.

b) **Low pressure at tap outlet:** A bucket takes an irritatingly long time to fill. A partial pipeline block or a partially open valve could be the reason.

c) **Low pressure at tap outlet when another tap is opened:** This indicates an inadequacy of pipeline carrying capacity and is difficult to overcome without carrying out changes in the distribution system.

d) **High pressure at tap outlet:** Water splashes all over and wastage results. A pressure reducing valve or restriction should be intentionally introduced into the pipeline to reduce the pressure.

e) **Muddy water issues from tap:** A common occurrence during monsoon period and if the storage tanks are dirty, this condition calls for effective filtration of water. On-line filters could be incorporated in the pumping mains. Pipelines should also be investigated for leaks through which outside water is probably entering the system.

f) **Chlorine smell in water:** Result of over-chlorination especially during monsoon period, this water becomes unpalatable to people. If it is a result of unintentional over-dosage in the treatment plant, the chlorinator can be suitably adjusted to reduce chlorine dosage. Otherwise, dechlorination by chemical or physical treatment may become necessary.

g) **Leaky tap:** The drip-drip tapping noise could be most annoying especially to the sick. This condition should never occur if the maintenance staff is alert.

Hot water is essentially required in patient areas like wards, operation theatres, intensive care units, laboratories, kitchen, laundry and such other departments. Basically a hospital requires hot water at two temperature levels – the lower level not exceeding 43°C (110°F) for patient washrooms with about 38°C to 40°C (100°F to 104°F) for showers, and the higher level of not less than 71°C (160°F) for physiotherapy, kitchen, cafeteria and laundry. Dietary requirement could be hot water at a minimum temperature of 49°C (120°F), and surgical and similar department may need it at about 40°C to 43°C (104°F to 109.4°F).

Electric storage type water heaters (generally called geysers) can be provided at required places for spot heating and supply of hot water. The thermostat temperature control could be set to obtain hot water at the desired temperature. But the sheer number of such units in a hospital places a heavy demand on maintenance and they could prove to be dangerous in case of failure of the safety devices when they may even burst spewing steam and hot water all around. Since the quantity of hot water requirement is considerable in most hospitals, a centralised hot water generator system would prove to be convenient, safe and beneficial. It could operate on electricity or fuels and could be mounted on the roof top of the hospital

building. Hot water could be distributed through down take vertical pipes with tee off arrangement at every floor. The entire hot water system should be well-insulated throughout.

A peculiar situation occurs which invariably leads to a huge wastage of water. The vertical pipes hold a good amount of hot water which will cool off during the night time stagnation condition. A person requiring hot water later on in the night will get cold water first which will need to be run to waste till hot water reaches the outlet. This wastage has to be avoided by installing a small pump at ground level which will continuously return a small quantity of hot water back to the hot water storage tank. This will ensure presence of hot water in the pipelines at all times so that wastage can be avoided.

It is difficult to assess the requirement of hot water in case of hospitals, because hot water is mixed with cold water before use. The mixing proportion depends on the particular desire of the actual user.

However the information provided in the table given below could be useful:

Possible Hot Water Requirements	
Patients	30 litres per bed per day
Operation theatre	As required basis, but likely to be 5 litres per bed per day
Physiotherapy	Nominal, say 500 litres per day
Laboratories	As required basis, but likely to be 1000 litres per day
Kitchen	10 litres per bed per day if disposables are not used (water at higher temperature)
Laundry	As required basis, depending on equipments requirement to be decided with equipment supplier. It could be 50 litres per bed per day
Attendants and visitors of patients	Depends on the policy of the hospital about permitting their presence. If permitted, then the following could be adopted: Attendants–15 litres per bed per day Visitors–3 litres per bed per day

It may be noted here that the quantity of hot water is not an additional requirement, but is drawn from the total quantity of water used daily by the hospital which is covered in subsequent sub-section 4.10 of this unit.

Cold water supply is needed for processing tanks in film developing room and perhaps by some machines which may have their own water chilling units. Cold drinking water is also essentially required and could be obtained by the use of storage type water coolers. Their installation should serve maximum number of people conveniently and be such as not to create wet floor alround. Wastewater from the water coolers need to be drained. Notice should be displayed prominently that the water is for drinking purposes only and not for washing or brushing teeth. Spitting into the waste drain in the cooler should be discouraged. It is advisable to install a spot water purification unit on the inlet water pipeline of water coolers. Water coolers must not be placed against walls which will deny adequate ventilation to the chilling equipment, and also not near a toilet for hygienic reasons and to prevent the misuse for washing purposes after toilet.

1.2.6 Public Health Services

Adequate toilet facilities should be provided and an excellent level of maintenance ensured to have hygienic conditions so vital in a hospital. Lack of water supply is the common cause for dirty toilets, the other very serious and common problem being line blockages caused by misuse and abuse. Flushing cistern should be functional at all times as it generates the requisite rush of water strong enough to keep the water seal near the toilet seat free of faeces. Otherwise stagnant faeces in the water seal will soften into a slime and form a coating on the pipe surface, ultimately choking it. Manual flushing with bucket of water is never equally effective and is very wasteful. Back flow is a serious condition and should never be

allowed to occur. This occurs more frequently in monsoon periods. The load on toilets is always increasing. With time more people coming to the hospital and original line size may prove to be inadequate to handle the increased sewage. This aspect needs careful attention and planning.

Sewer line blockage is a frequent occurrence and a major problem in a hospital. The clogging process occurs gradually and is difficult to detect till the blockage is complete and the toilet gets flooded causing the greatest inconvenience. Locating the point of blockage is as difficult as it is to clear it and make the line functional. Clearing operation is a nuisance whether it is inside or outside the building. Organised energetic regular maintenance of the entire system is the only practical answer to this malady.

Most urban hospitals discharge the waste into the municipal lines without checking the bacteria level which is likely to be high. This situation is one that is fraught with danger. In case of danger signs, hospital sewage should be pre-treated to make it safe and to conform to the general standards notified under the Environment Protection Act as applicable for discharging into the municipal system having terminal treatment plant. Rural hospitals may not have the benefit of municipal sewage lines in which case they will need septic tanks and soakage pits. These require a large area and are messy to maintain. Greater attention will be needed in this case. Hospital effluents which are discharged into sewers without terminal sewage treatment facilities or are not connected to public sewers should conform to the following norms:

pH	6.5 to 9.0	BOD	30 mg / litre
Suspended solids	100 mg / litre	COD	250 mg / litre
Oil and grease	10 mg / litre	Bio-assay test	90% survival of fish after 96 hours in 100%effluent

This may necessitate sewage treatment by the hospital itself to comply with the regulations.

1.2.7 Lightning Protection

Due to paucity of land space, vertical spread of hospitals is the order of the day. These tall buildings are vulnerable to lightning strikes which could cause serious damage to the building and costly equipment inside it. Therefore protection against lightning strikes is to be provided. This system simply affords to the lightning an easy resistance free metallic path to earth so that the building does not have to bear the brunt of providing a passage to the massive electricity. Vertical finials on top of the building are connected to down conductors running along the wall surface of the building which are earthed effectively into the ground to accomplish this task. A break in continuity of the conductors nullifies the effectiveness of this system and it is mandatory to check the continuity and the earthing system resistance at regular intervals. Lightning protection system should be totally independent and separate from the electric supply and distribution system.

1.2.8 Lifts and Dumbwaiters

All hospitals with more than one storey must have lifts for vertical transportation of patients, staff, visitors and supplies. Hospitals have passenger lifts, bed (or stretcher) lifts and sometimes goods lift. They are electrically operated with automatic controls, but are provided with manual controls also. A lift room houses the machinery of the lift and is generally located on the roof of the building. Material used for inside finish of the lift cage should be washable. The recommended speeds for bed lifts as per IS are as follows:

Speeds of Travel for Bed Lifts		
Travel	**No. of Storeys**	**Car Speed, metre/second**
Short travel lift	2 or 3	0.25
Medium travel lift	4 or 5	0.50
Long travel lift	6 and over	1.00

Passenger lifts should be easily accessible and preferably located near staircases. Hospital lifts should be placed near the wards and operation theatre department entrances.

Lifts should have power supply from mains and from stand-by generating sets. The normal practice is that, in case of fire, only one lift is to be in operation for use exclusively by fire personnel and all other occupants have to use staircases. This would not be acceptable in case of hospitals and therefore suitable understanding will have to be arrived at with the fire authorities. Controls, alarm push buttons and telephones in lifts should be so placed as to be within reach of wheelchair patients. Alarm system and emergency light are battery operated. All lifts, except the goods lifts, should be equipped with a special two-way switch to be used by the hospital staff to by-pass all landing buttons and travel directly to any desired floor. To prevent the lift doors from closing automatically even as a passenger is entering or exiting, an infra-red sensing device is fitted which keeps the door open. The lift should never move unless the doors are properly closed. Many accidents can take place due to unexpected movement of the lift with the doors open. Doors should never be forced open. The general practice is to have a lift attendant operating the lift during hospital working hours and then to put the lift on manual operation during the night.

Lifts should be subjected to load tests and a thorough inspection, and certified to be in conformity with safety regulations and codes before it is taken into service. Thereafter they should be maintained at the highest degree of perfection and got inspected at regular intervals.

Dumbwaiters are small box type elevators used for transporting stores from one floor to another. Separate dumbwaiters should be earmarked for vertical movement of sterile items and non-sterile items. These are electrically operated with the machinery suspended from the roof and have a travel speed of about 0.25 metre per second. Load carrying capacity is about 250 kg. The car size could be 1000 mm x 1000 mm x 1200 mm. "In Use" and "Car Here" indication lights are provided at all floors.

1.2.9 Structured Cabling

Not more than a few years back, low voltage telephone lines were the only ones provided in hospitals apart from internal electrification cables for lighting, ventilation and power supply. The next to join in were the lines used in nurse call systems in wards and patients call system in OPDs, piped music system in wards and selected hospital areas. PA system, pagers and lately cellular phones have come into use for communication nowadays. IS:10905 (Part 3)-1984 lays down that the communication system should be adequately designed for alerting all persons charged with patient care and all employees who are within the building in an emergency. The alerting system should be capable of operation from telephone switch boards and administrative offices. With the advent of computers within financial reach of individuals and institutions, a new dimension in cabling has been introduced. Use of computers in health care has increased phenomenally all over the world and their applications are bound to increase even more in future. Hospitals of today are facing heavy loads not only due to population explosion, but also due to a deluge of information. Computer aided management system has become inescapable as it has the following attributes:

- System is accurate and error free.
- System can process and analyse a large volume of data in a short time and present the results in the desired way or format.
- It can do the above from a single or multiple source of information stored in the memory bank.
- System can retrieve any data in a short time.
- Operators at different work stations have direct access to all information through remotely located terminals.
- System can store and transmit large volumes of data at high speed.

A good management information system and a constant evaluation of hospital activities are essential tools for managing a hospital effectively and efficiently. This system pertains to the network developed within the hospital for collection, storage and use of information to control various activities and events within the hospital.

Today any hospital needs a formidable communication network with more and more users sharing peripherals. This is essential to accomplish critical and complicated tasks for which faster access to information of a varied type is another requirement. It is therefore necessary that communication cabling be capable of supporting and sustaining a variety of

applications simultaneously—be it telephone, music, TV, computers or any other. Structured cabling is claimed to be capable of meeting all these requirements.

Structured cabling system can use the following types of media:

- Unshielded twisted pair (UTP), which is a 4-pair, 24 gauge, 100 ohm copper cable. This resembles the telephone cable, but its performance is enhanced.
- Shielded twisted pair (STP), which is a 2-pair 22 gauge, 150 ohm copper cable. Shielding gives the capability to perform well.
- Single-mode and multi-mode optical fibre cable, which is a thin glass transparent strand of material for transmission of modulated light to carry signals. The cable is flexible and consists of three distinct regions — a core, a cladding and a sheath. This gives a very high performance structured cabling system and a single pair of fibre cable can handle the same amount of voice traffic as 1400 pairs of copper structured cabling emanates from the telecommunication centre and extends to each outlet location passing through walls, floors and ceilings on the way. Any number of outlet points can be provided and only the necessary ones used at any time. This is very much similar to socket outlet points in internal electric supply wiring.

Modern hospitals are concerned with global telemedicine applications. Simply stated, this is a means of providing the highest class of medical services to remote locations worldwide through highly sophisticated telecommunications technology. Physicians at leading hospitals all over the world can deliver a range of most modern medical specialities to virtually every city in the world. Telemedicine holds the chance of revolutionising the provision of health care services by assuring medical access to remote locations and by enhancing medical dialogue. The telemedicine workstation provides a desktop system interactive or asynchronous multi-site multimedia (audio, video and data) medical information transmission with particular attention to clinics, hospitals and remote medical facilities. This system can conduct and manage remote consultations. Some of the capabilities are:

- Transmit and store medical images and X-rays.
- Capture images from video cameras, digital medical instruments or still cameras.
- Concurrently display patient data, audio/video conference.
- Share image, patient records and supporting data.
- Store and forward single item or entire multi-media patient folder.

The structured cabling system can fully integrate all wiring systems that are concerned with information traffic, voice, data videos, building controls and security systems. This is a stepping stone to intelligent buildings.

1.2.10 Intelligent Buildings

It is no longer enough for a building to be just beautiful. It will have to be intelligent also if it wants to be modern with a futuristic outlook. With the power tariffs going up and up, and with labour costs soaring, any building of considerable size and varied usage will have no choice but to "act intelligently" at all times, even when it is vacant. An "intelligent building" is one that is designed to anticipate the needs of the owner and the occupant, and possesses the ability to "learn", "think fast", "apply knowledge" and "act fast".

The concept is just a decade old, but is catching up in the corporate buildings and will surely find its place in hospitals very soon as it can beneficially use all its capabilities. A few of the functions can be explained as follows:

- Switch on or off lights, start or stop fans and air-conditioners depending on the presence or absence of the user.
- Balance artificial lighting level with natural light infiltrating into a space to provide the desired illumination level.
- Adjust air-conditioning effect based exactly on load conditions.
- Operate and monitor security systems like closed circuit cameras and activate motion detection system only at night.
- Switching on or off security, perimeter or area lighting as programmed.

- Controlling access by identifying personal access card.

Enabling demand based energy usage, the system cuts down on energy costs appreciably. Simultaneously manual labour and effort are also reduced so that further savings accrue. A basic building automation system may cost less than a sophisticated sprinkler fire fighting system. Coupled with the pay back that it offers, this goes to prove its viability.

1.2.11 Hospital Roads, Pathways and Drains

Hospital roads should be wide enough with sufficient turning radius at bends so that delivery trucks, fire engines and tenders can use them. Hospital roads should fulfill the requirements specified by the local fire authorities. They should be planned to make traffic movement safe and less noisy. Traffic control should be easy. Blind corners are very dangerous and should be avoided. Direction signs should be prominently displayed to reduce traffic confusion. Access road to emergency department should be well marked right from the point of entry to the hospital and no person or vehicle should have any difficulty in reaching the doors of the emergency without loss of time. Other vehicular and pedestrian traffic should not find it necessary to use this access road. Entry and exit directions should be clearly marked and well defined. Water-logging should not occur at any point in the roads and pathways, especially those leading to emergency. Roads, footpaths and pathways should receive due importance in maintenance and upkeep, especially soon after the monsoon period when they are most likely to have suffered extensive damage.

Roadside drains should be very well planned, executed and maintained to ensure speedy disposal of rain water and to prevent water-logging which will become a source of mosquito breeding and rotting matter that could generate cross-infection problems. Covered drains should be preferred in hospitals against open drains which could cause injuries and accidents. Broken or damaged covers should be promptly replaced. Roadside drains and the hospital grounds should be thoroughly cleaned and cleared of silt and rotting matter before onset of monsoon. Simultaneously portions of drains that have sunk and are upsetting the slope should be repaired.

1.2.12 Horticulture, Arboriculture and Landscaping

A good hospital should have pleasing surroundings which present a welcoming appearance to the patients and visitors. Horticulture is the art of garden cultivation resulting in a variety of flowers, and arboriculture is the scientific cultivation and management of trees and shrubs which includes varieties such as forest timber trees, fruit trees and ornamental woody plants. Horticulture and landscape elements enhance the comfort conditions inside the hospital building. Maintenance of gardens, flower beds, trees and hedges, and lawns should be a concern of hospital authorities and it is best to have a master plan prepared in consultation with the specialists in the field. Long gestation periods can be expected and the project may have to be executed in planned phases. In any case, tree plantation should be a feature on special occasions and annually at any rate. Trees are a great asset in reducing dust and noise. Tree felling and vandalizing or misusing for playful purposes and nailing posters or advertisements should be strictly prevented. Visitors are likely to eat food on the lawns and are sure to leave litter and trash at the place, to remove which a mechanism should be created by the authorities. Sprinkler systems for watering lawns and gardens could reduce man-power. Stores for seeds, manure, pesticides, instruments and implements etc. should be provided. Since most hospitals are multi-storeyed, a terrace or roof garden at mid-level on an intermediate block will break the height effect for those in higher floors of adjacent buildings.

1.3 ELECTRICITY SUPPLY

Electricity in the service of mankind knows no bounds. The extreme cleanliness accompanying the use of electrical energy has made it possible to use it in every nook and corner of the hospital premises. No other form of energy enjoys this status. In the realm of lighting, electricity is unrivalled in convenience and cheapness. In the power field, electric motor rules supreme because of flexibility, ease of manipulation and of course cleanliness. Electricity transmission is convenient, clean, cheap, flexible and eminently practicable. While every attempt has been made to make the explanation simple, this topic has to be slightly technical out of necessity and you should make your own efforts to gather more background knowledge to supplement this.

1.3.1 Sources of Supply and Standard Voltage

Ideally, electric power should be obtained from State Electricity Board (SEB) as own captive generation of full power requirements will be prohibitively costly. In case of hospitals, where power failures are unacceptable, power should be obtained from at least two independent sub-stations of SEB. This increases reliability. This is called as the "mains supply". An agreement with SEB for obtaining power will have to be entered into. Payment for electric power consumed will have to be made.

In single phase two-wire system, the standard voltage is 240 V. The standard voltages in three phase systems are 0.415, 3.3, 6.6, 11, 22 and 33 kV. It is unlikely that a hospital will receive electric power at higher voltages than 33 kV.

Hospitals require a great amount of power. This could be as high as 6 to 8 kVA per bed depending on the size and status of the hospital. This quantum of power cannot be supplied at lower voltage levels and the tariffs will be very high. Supply voltages for different loads are given below:

Power, kVA	Upto 100	1001 to 1000	1001 to 2000	2001 to 3000	Above 3000
Supply voltage, KV	0.415	6.6 or 11	11	22	33

1.3.2 Electric Sub-station

When the supply voltage level is above 415 V, the voltage will need to be stepped down before electricity can be used. Transformers of the distribution category will be necessary for this purpose.

Transformers upto 250 kVA capacity can be mounted on a two-pole structure which will be convenient and cheap. Bigger transformers upto 750 kVA will need a four-pole structure. But it is rather difficult to pole mount a transformer above 500 kVA due to its weight. Big transformers can be placed on a suitable concrete base whose height is above the flood level. Fencing will have to be provided to prevent unauthorised access. These transformers are of outdoor type and will work at higher temperatures due to absence of shade.

Indoor type transformers need suitable covered accommodation. Multiple units should be segregated by a wall of four hour fire resistance. As per IS:1869-1967, the clearances should be as follows:

Wall on	One side	Two sides	Three sides	Four sides
Clearance	0.50 m	0.75 m	1.00 m	1.25 m

Good ventilation enables the transformer to dissipate heat and thereby perform better.

Substation is the electric power receipt and dispersal point which keeps the hospital ticking at all times. Hospitals need a distribution sub-station for stepping down the supply voltage to the level of 415 V and for distributing the power to the various departments of the hospital. Electric sub-station should be a protected place.

This sub-station generally houses the incoming and outgoing HT switch gear, incoming and outgoing LT panels and the stand-by generating sets. Hospital power consuming equipment degrade the power sector substantially leading to power problems and higher energy bills. Therefore power factor improvement with a bank of capacitors is also carried out in the sub-station. Improvement to 0.95 pf level is ideal.

Sub-stations can be of the totally outdoor type, or be of the totally indoor type. Even partial indoor-outdoor design is possible. Totally outdoor sub-station is adopted for voltages higher than 33 kV. While transformers can be of outdoor type, it would be desirable to house their controlling and metering switchgears properly in a building where they can perform better under shaded and dust protected conditions. Excellent lighting and ventilation should be provided in the sub-station with adequate space for the operators to work and keep the maintenance items safely. It is always wise to have extra space for future expansion.

1.3.3 Switchboards and Power Distribution

A hospital distribution system is likely to have the following:

- HT side of sub-station (6.6 kV and above)
- LT side of sub-station (about 433 V)
- Main LT distribution panel(s)
- Distribution Boards (DB) and Sub-Distribution Boards (SDB)
- Points of consumption

The LT switch board in the sub-station disperses a huge quantum of power to several panels placed at judiciously located load centres. These further distribute the power to numerous distribution boards (DB) and their sub-distribution boards (SDB) located nearest to the zone or area that they serve. They are almost always placed in niches in the walls and possess miniature circuit breakers (MCB) to control the several load circuits.

Hospital sub-stations distribute considerable amount of electric power and for this purpose distribution cables or solid bus bars are used. Electric cables are the common choice because they are relatively easy to lay and are cheap. But their numbers multiply with increasing loads and management becomes problematic. Moreover, having a good content of PVC material, the fire hazard potential also increases which is undesirable in case of hospitals. A single bus bar trunking system can convey any amount of power without enhancing the fire risk. This system is costly to install and consists of aluminium strips which are the conductors placed inside a metal enclosure. Insulating separators ensure that the strips are spaced correctly. The enclosure can be made dust and waterproof.

1.3.4 Load Segregation

Continuity of power supply is essential in several cases in a hospital, common examples being the ventilator and the monitor, operation theatre, ICU and so on. Equipments are costly and cannot be allowed to remain idle for long periods. Some loads are not so critical, examples being lights and fans in waiting areas, passages etc. Therefore hospital loads are generally identified as being essential or non-essential. Essential loads are powered by stand-by generating sets in the event of mains failure at which time the non-essential loads do not get any supply. By doing so, the generator capacity is reduced to a manageable level and the expenses of own generation is also lowered. In this arrangement, essential and non-essential loads will have to be on separate circuits to enable power supply from the generator to reach only essential loads.

1.3.5 Spot Power Improvement

Many equipment are extremely sensitive to voltage variations and even burn out due to erratic voltage supply. Computers and electro-medical equipment are examples. These equipment need to be protected against voltage fluctuations by providing voltage stabilizers at their places of use. Some equipments and machines lower the power factor and lead to draw of excess currents from the lines. They may even malfunction or get damaged due to this effect. MRI is one such equipment. In this case, spot power factor improvement will have to be resorted to. The supplier himself will provide the power factor improvement apparatus. Low voltage is as dangerous as high voltage. Hence the supply voltage should remain within limits tolerated by the equipment.

1.3.6 Stand-by Power Supplies

Interruption of electric supply would be intolerable in many places in a hospital. It could prove to be highly dangerous and can cause loss of life, computer data and even property. This break in power supply may occur due to non-receipt of power from the supplier or a fault in the distribution system of the hospital itself.

Therefore there should be several types of additional power supplies in a hospital. Examples are given below:

- Stand-by diesel engine-driven generating sets (DG sets) supply
- Emergency batteries supply
- Uninterrupted Power Supply (UPS) system

1.3.7 Stand-by DG Sets

This is captive or organic generation of electricity by using diesel engine-driven generating sets working at 415 V. This alternate supply should be capable of meeting the essential requirements of the hospital which should be identified with extreme care. In addition to medical equipment and so on connected with patient care and health delivery systems, the National Electric Code recommends that following loads should also be on stand-by DG sets:

- Water supply pumps
- Fire fighting pumps, smoke extraction and damper systems
- Fire-alarm control panel
- Fire lift
- Security lighting
- Obstruction lights
- Lighting in common areas such as lift lobbies, stair-cases, entrance hall, common toilets, corridors etc.
- Any other functional and critical loads

To this list, we could add the following:

- Lights in auditorium, seminar and conference hall
- Lights in important offices and cashier counter
- Burglar alarms and secured places

Stand-by sets are generally installed in the sub-station so that power distribution can be done easily. These sets can be made to start automatically by using an automatic mains failure (AMF) panel. With the provision of AMF panel, the set will come on load within a few seconds of mains supply interruption. Two or more sets are installed to collectively take care of the load and also meet the eventuality of one set failing to start. They need fuel supply for which a fuel tank of adequate capacity will have to be installed. Diesel engines make considerable noise and emit pollutants in the exhaust. Effective silencing and emission control measures will have to be adopted. The generating sets should have ample space all around and more roof height to permit installation of exhaust piping and to reduce the noise

Moreover, good ventilation is necessary to dissipate the heat from the engines. A few details of the larger capacity sets are as follows:

Diesel Engine Generating Sets					
Capacity, kVA (kW)	Current, A	Engine HP	Approx. fuel consumption litres/hr	Size, L x W x H mm	Weight kg
500 (400)	695	614	108	4510 x 1460 x 2400	6200
600 (480)	834	700	129	4510 x 1460 x 2400	6300
750 (600)	1042	890	154	5070 x 1780 x 3200	8800
1000 (800)	1390	1180	203	5635 x 1894 x 3200	11500
1250 (1000)	1737	1470	225	5635 x 1894 x 3200	1244

Generating sets need permission and approval from SEB for installation and use. After installation, the Electrical Inspector will inspect the installation and check the kWh meter which will then be sealed. Certificate will be issued by him and the hospital will be charged for the units of power generated by themselves.

1.3.8 Uninterrupted Power Supply (UPS)

Sudden disappearance of electric power is a totally unacceptable situation in all critical areas and functions of a hospital. Take the case of operating room or the ICU or the pathological laboratory as examples. In the present day situation of power supply which is full of aberrations, the UPS system offers a viable solution. A well designed and excellently maintained stand-by genset will take as much as 5 to 8 seconds to come on load and even this short period of blackout is dangerous to a critical patient.

The UPS system depends on a fully-charged battery bank for instant power supply in case of mains failure. These batteries are on continuous charge from a powerful battery charger unit in the UPS. When mains power disappears, these batteries supply DC power to an inverter in the UPS which changes the DC voltage to AC voltage at the correct level. Backup power period depends on the number and capacity of batteries and can be for an hour or two. But batteries are costly and occupy lots of space. Therefore this duration of UPS use should be judiciously decided upon. The UPS system provides uninterrupted and clean AC power with closely regulated voltage and frequency. An UPS system will fail if the inverter which converts DC voltage to AC voltage fails. For this reason two inverters of full capacity are used, out of which one will be on ready stand-by status to come on as soon as the working inverter fails. Using three inverters of full capacity will increase reliability.

When the inverter is the only source of power supply to the critical loads, the arrangement is called as "single source configuration" or "on-line UPS". In the "two-source configuration", there is provision for two sources of supply to the critical load, one of which is preferred source and the other the alternative source. This is further divided into the "off-line UPS" and "on-line UPS". In the "off-line UPS" system, the preferred source is the AC mains supply and the inverter output is the alternative source. The batteries are not loaded always and therefore will have longer life. In the "on-line UPS" system, the preferred source is the inverter power supply and the alternative one is the AC mains supply. In this system, the batteries will be in continuous use and will also be getting charged continuously from the AC mains supply except when the mains power is off. This is the correct system of power to operating rooms.

Because of frequent interruptions in power supply, many homes have gone in for an "inverter". You can easily make out that this is actually a "off-line UPS" apparatus, but of small capacity sufficient to power a tube light or two with one or two fans. Sometimes it is referred to as an "electronic generator". This can be conveniently used for isolated loads in a hospital which cannot be connected to a central UPS system and therefore a few details are given in the table below:

Load Calculation and Typical Inverter Details				
Load Calculation		Details		
Equipment	Load	Capacity	Battery	Back up time at 60% load
Tube light	50 to 60 VA	300	12 V / 120 AH	4 hrs
Fan	60 to 90 VA	500	12 V 190 AH	4 hrs
Lamp	Watt rating	500	24 V / 120 AH	6 hrs
TV	60 to 80 VA	750	24 V / 180 AH	6 hrs
Computer	500 VA	1000	24 V / 180 AH	4 hrs
Telex	150 to 250 VA	1000	48 V / 180 AH	8 hrs
Fax	50 to 100 VA	2000	48 V / 180 AH	4 hrs
Desert cooler	300 to 500 VA	5000	48 V / 180 AH	1 hr

1.3.9 Earthing

You would have noticed that some plugs used at home have three pins. The top pin is for connecting to the earth wire. This is to protect persons from receiving a shock from the body of the apparatus being used. Equipment earthing is the connection of non-current carrying metallic parts of the equipment with the mass of the earth using a metallic conductor of negligible resistance. This path will ensure an immediate discharge of energy to earth without causing harm or posing a danger to persons at any time. The parts which are not supposed to carry any current under normal working conditions could be the body of a motor, switch, metal enclosure, conduits used in wiring, steel structures, electric poles, portable equipment such as electric iron, grinders, mixes and so on. It would be better if medical equipment such as X-ray machines, MRI and so on are provided with earthing by the suppliers themselves. Provision of double earthing enhances safety. Earthing is a requirement as per Indian Electricity Rules, 1956, and have to be tested at specific intervals and results recorded.

Earthing of electric supply system should be totally independent of and separate from the earthing of lightning protection system.

1.3.10 Electrical Inspection

All electric installations have to comply with the provisions in Indian Electricity Rules, 1956. Moreover, the installations will be inspected by Electrical Inspectors duly appointed for this purpose before the installation can be commissioned and taken into service.

1.3.11 Future Expansion

Invariably there will be a build up of load in the years to come necessitating greater power intake and distribution. This aspect should not be lost sight of at the initial planning stage and sufficient space should be left free to enable expansion of the system.

1.4 WATER SUPPLY

Provision of an adequate supply of water of suitable quality constitutes one of the first important essential requirement vital for the life and health of human beings. Hospitals need supply of cold water, hot water, soft water, distilled water and ultra pure water for medical purposes. Water is also required for the cooling systems of equipment, for steam generation, for plants and gardens and for fire fighting when it strikes.

Water is a potent universal cleansing agent, but it is susceptible to contamination easily when it turns into a conveyor of diseases. Therefore, water is invariably subjected to suitable treatment before use. Use of raw water even for gardening and area beautification through fountains and waterfalls is not to be advocated as it may be inadvertently consumed by workers and ignorant visitors which may prove to be harmful. In addition, it will involve a cumbersome system of parallel pipelines, one for treated water and another for raw water.

1.4.1 Sources and Nature of Water

Sources of water supply could be a local civic body (like Municipality, Corporation or Board), or own bore wells or dug wells. In most cases, hospitals obtain their requirement of water from the local civic body. Water supplied by them will be pre-treated and safe for human consumption. In some unusual circumstances, local treatment of a simple nature may become necessary. Water supply is based on an agreement between the parties and water bills are to be paid as per the stipulated terms.

When the civic source is non-existent or the supply therefrom proves to be inadequate, the hospital has to resort to winning underground water by drilling deep wells. These wells are executed by machines which drill upto 100 metres or more below ground level. The deeper the well, the greater the chances of obtaining high yield of water with less chances of contamination. Borewells should be protected against contamination. For this purpose, they should be sited away from sources of pollution like surface drains, underground sewers and chemical effluent discharge nearby. There should be a wide enough concrete cover around the bore just like plinth protection (say of 1 metre radius) and the place protected against unauthorised intrusion. Water quality should be got tested at frequent intervals.

Sometimes existing dug wells or shallow wells at the hospital site are retained, but their water should be used with utmost caution. These are highly susceptible to surface contamination and could start water-borne diseases. These wells should have a dependable wall with a wide concrete or stone paving protection alround on the ground and a strong steel mesh cover on top. Cleaning, washing and other acts likely to cause water pollution should be prohibited in the near vicinity of the well. Their yield is likely to be poor, but they store a good quantity of water because of their large size.

1.4.2 Hard and Soft Water

It would be childhood knowledge for you that hard water requires more soap to form lather than soft water. Water hardness depends on the presence of bicarbonates, sulphates, chlorides and nitrates of calcium and magnesium. For convenience, hardness is expressed in terms of calcium carbonate ($CaCO_3$) salt. Temporary hardness is removable by boiling the water, but this is possible if quantity of water required is small. Permanent hardness cannot be removed by boiling. Hard water is quite wholesome for drinking, but it is objectionable for boiler, laundry (washing) and industrial (equipment cooling) uses. In their case soft water should be used because it is free of scaling tendencies. Soft water is preferable for use even in sterilizers, TSSD and medical instrument cleaning purposes. Water with hardness in excess of 300 ppm is considered as very hard. Water for human consumption should have a

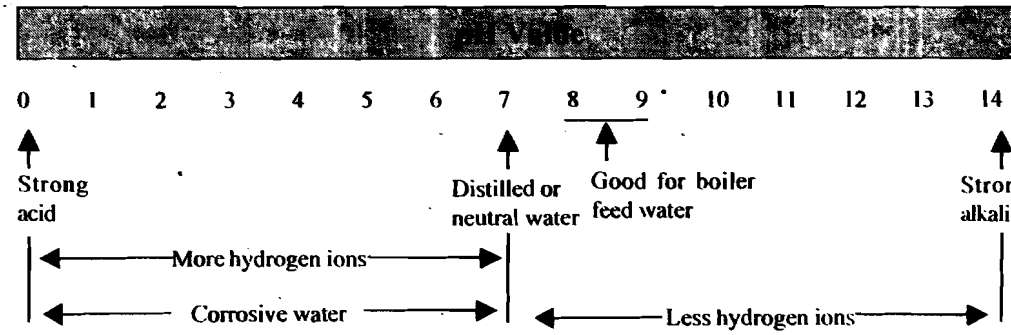
hardness not exceeding 200 ppm. Salts commonly found in natural water and their effects are given below:

Salts in Natural Waters		
Sl.No.	**Ingredient**	**Remarks**
1	Sodium chlorate (Common salt), NaCl	Most likely to be present in all potable water. renders water unpalatable if present in large quantities.
2	Sodium bicarbonate, $Na(HCO_3)_2$	May be present from 20 to 500 ppm. Harmless to health.
3	Sodium sulphate, Na_2SO_4	Causes purging action.
4	Magnesium sulphate $MgSO_4$	Causes permanent hardness and purging action.
5	Calcium Chloride, $CaCl_2$	Causes permanent hardness.
	Magnesium chloride, $MgCl_2$	
6	Calcium bicarbonate, $Ca(HCO_3)_2$	Causes temporary hardness.
7	Calcium sulphate (Gypsum), $CaSO_4$	Causes permanent hardness. corrosion of iron and steel.
8	Potassium salts	Small quantities cause no harm.
9	Silica, SiO_2	Not harmful.
10	Ferrous bicarbonate, $Fe(HCO_3)_2$	Causes brown colour, encourages organisms growth imparting unpleasant odour. Can cause blocking of pipes.
11	Copper, manganese, zinc, lead, arsenic salts	Lead and arsenic salts are poisonous and must be removed. Other metallic salts impart unpleasant taste and colour and be health hazard if insufficient quantities.
12	Nitrites	Being present in sewage, presence in water should be taken seriously. Proper treatment becomes inescapable.
13	Nitrates	Harmless but make origin of water suspicious.
14	Ammonia, free and saline	Presence indicates serious pollution.

1.4.3 pH Value of Water

Acidity or alkalinity of water is measured on the "potential hydrogen" or the hydrogen ions (or particles) present in water. Chemically neutral water, which is neither acidic nor alkaline, is taken to have a pH value of 7. Water with pH values lower than 7 is acidic whereas water with pH values higher than 7 is alkaline.

A simple representation of pH scale is given below.



In water treatment, acidic water (pH value less than 7) will not permit alum to form "floc" and sodium carbonate may have to be added to increase the pH value to 7 or more. Boiler feed water should be neutralised if acidic and be made alkaline with a pH value between 8 and 9. The pH value of water decreases as water temperature increases. Water for human consumption should have a pH value between 7.0 and 8.5, and is not fit for human use if pH value is less than 6.5 or more than 9.2.

1.4.4 Physical and Chemical Standards

An abridged tabulation is given below. Figures under column "acceptable" are limits up to which water is generally acceptable to consumers. Figures under column "cause for rejection"are limits beyond which water has to be rejected. Figures in excess of those under column "acceptable" render the water not acceptable, but still may be tolerated in the absence of alternative and better sources but upto the limits indicated under column "cause for rejection".

Physical and Chemical Standards of Water		
Characteristics	**Acceptable**	**Cause for rejection**
Taste and odour	Unobjectionable	Unobjectionable
pH	7.0 to 8.5	< 6.5 or > 9.2
Total dissolved solids (mg/l)	500	1500
Total hardness (mg/l) (as $CaCO_3$)	200	600
Chlorides (mg/l) (as Cl)	200	1000
Sulphates (mg/l) (as SO_4)	200	400
Fluorides (mg/l) (as F)	1.0	1.5
Nitrates (mg/l) (as NO_3)	45	45
Calcium (mg/l) (as Ca)	75	200
Magnesium (mg/l) (as Mg)	30 or less	150
Iron (mg/l) (as Fe)	0.1	1.0
Manganese (mg/l) (as Mn)	0.05	0.5
Copper (mg/l) (as Cu)	0.05	1.5
Zinc (mg/l) (as Zn)	5.0	15.0
Mineral oil (mg/l)	0.01	0.3
TOXIC MATERIALS		
Arsenic (mg/l) (as As)	0.05	0.05
Cadmium (mg/l) (as Cd)	0.01	0.01
Chromium (mg/l) (as hexavalent Cr)	0.05	0.05
Cyanides (mg/l) (as CN)	0.05	0.05
Lead (mg/l) (as Pb)	0.1	0.1
Selenium (mg/l) (as Se)	0.01	0.01
Mercury (mg/l) (total as Hg)	0.001	0.001

1.4.5 Bacteriological Qualities

Standards for bacteriological quality of water distinguishes between piped water supplies, unpiped water supplies and emergency water supplies. The guideline values specified are generally for faecal califorms and caliform organisms. The virological quality of drinking water should be such that water is free from any viruses infectious to man. This can be ensured by using water from a source free from wastewater and faecal contamination, and by effective treatment of water under all adverse circumstances.

1.4.6 Analysis Report

A complete water analysis report should generally include the following information amongst others:

a) Physical characteristics, i.e. turbidity, colour, odour

b) Chemical characteristics like the following:

   i) Chlorine absorption — ppm

   ii) Reaction (acid or alkaline) — pH value

   iii) Total solids — ppm

   iv) Ammonia (free and saline) — ppm

   v) Ammonia (albuminoid) — ppm

   vi) Nitrites—if present, water should be condemned unless it can be positively proved that the nitrites are a result of reduction of nitrates by inorganic substances

   vii) Nitrates—ppm

   viii) Chlorine as chlorides—ppm

   ix) Oxygen absorbed from acid permanganate—ppm

   x) Hardness (temporary or permanent) — parts of $CaCO_3$ per million

   xi) Presence of poisonous metals

c) Bacteriological — Bacterial content, number of B Coil present per millilitre of water following incubation at 37°C (98.8°F) for 24 hours in MacConkey broth.

d) Finally a statement that the water is or is not fit for drinking without further treatment. If treatment is required, it would help if the nature and type of treatment required is indicated.

1.4.7 Disinfection of Water

Disinfection of water is commonly achieved by the process of Chlorination. Chlorine gas can be injected directly into the water to be treated or can be dissolved in water to form a strong solution which can then be forced into the water under treatment. Gaseous chlorine is greenish yellow in colour and is about 2.5 times heavier than air. Under heavy pressure, it becomes an amber coloured oily liquid. Chlorine gas is supplied in liquid form in steel cylinders and the liquid evaporates by absorbing heat from the surroundings. The ambient temperature should not be less than 18.3°C (65°F). Evaporation causes the cylinder to become cold and this reduces the rate of gas formation. Dry chlorine is non-corrosive, but moist chlorine is highly corrosive. Chlorine gas is a powerful irritant to the lungs and eyes. For these reasons, cylinder leaks should not be allowed to occur. Chlorination does not alter the pH value of water. The apparatus used for administration of chlorine gas is called "chlorinator". It is very important to ensure adequate ventilation of the room housing the chlorine cylinder and chlorinator apparatus.

Administration of adequate chlorine dosage is of utmost importance to ensure complete destruction of bacteria and the correct level of residual chlorine at the user's end. Also destruction of organisms increases with the contact period available for disinfection. This contact period should not be less than half an hour or the chlorine dosage may have to be increased. Excessive residual chlorine gives an undesirable odour and taste to water. Residual chlorine levels are difficult to predict, but a free chlorine level of 0.5 mg / litre for one hour is considered sufficient to inactivate virus and make the water safe.

Water disinfection can also be achieved by ultraviolet irradiation. Disinfection effectiveness depends on the following factors:

- Water is free from suspended and colloidal substances causing turbidity.
- Water is free of light absorbing substances.
- Water is flowing in thin film or sheet pattern.
- Water is exposed to ultraviolet rays of adequate intensity for sufficiently long time.

Advantages of ultraviolet irradiation are that no foreign matter is actually introduced, no taste or odour is produced and period of irradiation is quite short. The disadvantage is that there is no residual effect which will ensure that water remains safe after treatment unlike the residual chlorine effect. Hence treated water should be used before long. Moreover, the apparatus is rather costly, but its application in small spot-treatment units has been successful.

1.4.8 Reverse Osmosis Process

You know that sea water is salty to taste as it contains excessive dissolved salts and is called brackish water. Even ground water could be brackish and unfit for human consumption. But brackish water can be treated by Reverse Osmosis (RO) Process which is capable of a high degree of filtration. This process employs cellulosic polyamide and specialty polymer membranes to rid water of dissolved salts, bacteria, pyrogens and organic. Proper pre-treatment of water is most important without which poor salt rejection and irreversible damage to the RO membrane can occur. This is however a costly process needing extra care, skillful operation, attention and maintenance/replacements.

1.4.9 Ultra-pure Water

Water used in certain situations such as in dialysis need to be specially treated for purity. This involves water softener having cation (positively charged ions) resin to remove hardness and render water free from scaling tendencies. An activated charcoal filter then removes chorine, chloramines and dissolved organics. An efficient sediment filter down-stream traps carbon and other particulate matter. An ion exchange or similar unit then removes all dissolved impurities and has on-line conductivity meter and water temperature indicator. Even for scrub-up in operation theatres and for laboratory use, water should be of high purity. Ultrafiltration and microfiltration machines are available which use special cartridge filters to remove particles in the range of 0.05 to 2.0 microns (one micron is one-millionth of a metre or one-thousandth of a millimetre).

1.4.10 Quantity Assessment

Assessing the daily water requirement for a hospital is an intricate and difficult task because of the quantum and nature of population load. This exercise finds its basis in specified norms which are as follows in case of hospitals and a few interrelated loads:

Hospital Water Requirements			
a)	**Hospitals (including laundry)**		
	i) Categories A&B (25 to 100 beds)	—	350 litres per bed per day
	ii) Category C (101 to 300 beds)	—	400 litres per bed per day
	iii) Categories D & E (301 to 750 beds)	—	450 litres per bed per day
	[Based on IS:10905 (Part 3)-1984]		
b)	Hostels	—	135 litres / head / day
c)	Nurses Homes and Medical Quarters	—	135 litres / head / day
d)	Day Schools/College	—	45 litres / head / day

Note: Mr Ervin Putsep, an eminent expert on hospitals, in his book titled "Modern Hospitals" has stated that the general estimate of water supply requirement is about 400 to 650 litres per bed per day which is a significant increase from the age old scale of 300 litres per day.

The provision shown above for hospitals does not include the water requirement for attendants, relatives and casual visitors of the patients, and a suitable allowance has to be made to this inescapable necessity based on the social and climatic conditions.

Air-conditioning plant is another huge consumer of water. Once the plant capacity is assessed on reasonably accurate data and working hours are known, water requirement can be estimated. A provision of 200 litres per day per ton of plant capacity should suffice for this purpose. Stand-by generating sets and some bio-medical equipments also need water for cooling purposes, but their requirements are not likely to be large.

Water for horticulture, arboriculture and beauty spots like fountains is another unavoidable necessity, but the requirement has to be anticipated on case to case basis. Need of water for lawns will be considerable.

Other water allowances pertain to evaporation and leakage losses, fire fighting practice drills and the like. An enhancement of 3% to 5% should be adequate for these purposes.

Accurate assessment of water requirement for a hospital is a difficult task, but should be done with utmost care to ensure that the hospital does not suffer from inadequacy of water and the projected requirement is not outside the capacity of the supplying agency.

1.4.11 Water Supply System

A hospital water supply system will generally comprise of the following major items:

- An underground storage sump to receive water during the periods of supply
- Pumps to pump stored water to overhead storage or service tanks through rising mains
- Overhead tanks located atop the hospital block
- A vast distribution network of pipes

Some knowledgeable authorities have advocated that 3 to 5 days water requirement should be stored, but this may prove to be too huge and impractical in case of large hospitals. However, the storage capacity should suffice for at least two days requirement as per IS:10905. Water is generally received into an underground storage sump which should be divided into two compartments to facilitate cleaning one by one without disrupting the water supply. Cleaning frequency is dictated by the clarity of water received into the sump. It is important to ensure that stored water is not allowed to stagnate, but is turned over. There should be no possibility of surface water from outside leaking into the storage tank.

Centrifugal surface pumps are the common choice for pumping water. However, submersible pumps can also be used under certain conditions to pump water from sumps. These pumps are a natural choice for winning water from deep bore wells.

External water supply distribution system is likely to be limited in a hospital unless the hospital has teaching and training facilities, hostels and residential accommodation. Pumps draw water from the storage sumps and pump it through delivery or rising main into elevated storage reservoirs or service tanks on top of the buildings. The distribution then takes place by gravity.

Mostly cast iron (CI) or galvanised iron (GI) pipes are used in external water supply as they are strong and are able to sustain pumping pressure as well as any vehicular load combing over them. While laying, it is best to keep these pipes away from sewer mains and places of contamination which could prove harmful. Water line should be well above any sewer line at least by a metre at the crossing point. It would be prudent to avoid a water pipe joint at this crossing point. Anchorage of pipes at bends is essential to prevent the joints from opening up. A proper up-to-date record should be kept of all the pipe routes to assist in easy location for maintenance and repair purposes.

1.5 STEAM SUPPLY

Hospital kitchen and laundry need supply of steam. Even the Central Sterilisation and Supply Department (CSSD) needs steam for sterilisation purposes.

1.5.1 Hot Water and Steam

When normal tap water is heated, its temperature goes up which can be measured by a thermometer. The maximum temperature attainable by water at atmospheric pressure is 100°C (212°F). Under higher pressures like in a boiler, water can reach higher temperatures. At this point, addition of heat does not increase the water temperature, but boiling starts and water changes its form from liquid to vapour which is steam at the same temperature. This heat is called latent heat of evaporation and cannot be measured by a thermometer. Thus steam contains both heat of water and latent heat of evaporation. It means more heat can be made available through steam than hot water. Steam produced from boiling water contains minute water particles and is called "wet steam".

1.5.2 Steam Boilers

Steam boilers produce steam from water. Heat source may be fuel oil or electricity. Boilers using fuel oil will need fuel storage and supply back-up and a flue gas chimney. Electric heating is cleaner and may be by resistance wires or electrodes. Electrode boiler is costly. These boilers achieve virtually instant steam generation from start. Some of these boilers do not come under the purview of Indian Boiler Regulations (IBR) and are classified as non-IBR boilers. They can be installed at ground level or on higher levels, but basement installation is not preferred. They are provided with necessary safety and control devices.

Their rating is based on weight of steam produced per hour with water from and at the boiling temperature corresponding to the operating pressure. Since the actual feed water temperature is bound to be lower, and this water will consume heat to reach boiling temperature, the weight of steam produced will be less than the boiler rating. Therefore, selection of boiler capacity has to be done carefully based on the feed water temperature. Preheating feed water using waste heat of any other source will increase the steam output. Laundry requires steam at a pressure of 10.5 kg per sq cm (150 lb per sq in).

1.5.3 Steam Distribution System

Heavy grade steam pipes convey steam to the points of use and these pipes are adequately insulated to reduce heat loss. Traps for collecting water particles condensing out of steam are provided and these need to be emptied at intervals and the condensate water drained out.

1.5.4 Boiler Feed Water

Clean, soft and alkaline water with pH value between 8 and 9 should only be used for steam generation. Best quality feed water will inhibit scale formation in boilers and will result in better quality steam which is preferable for sterilisation processes.

1.6 CENTRAL MEDICAL GASES, AIR AND CLINICAL VACUUM DELIVERY SYSTEM

Centralised medical gas supply and pipeline distribution system has proven merits as an effective tool towards better patient care in hospitals. The system as a whole is efficient, economical and a highly dependable life support service that conveys oxygen, nitrous oxide, compressed air and vacuum facility to patient spots in wards and operation theatres. The service provided by the system is uninterrupted and uncontaminated with reliability doubly assured by the use of safety and alarm devices.

1.6.1 Boiler Feed Water

Some of the benefits are tabulated below:

Benefits of Centralised Medical Gas Delivery System		
Benefits to Patients	**Benefits to Staff**	**Benefits to Administration**
Supply is uninterrupted, uncontaminated and reliable	Delivery of gases is reliable, continuous and safe	Rationalization of ordering, storing and transporting procedure
Supply is aseptic and safe – no apprehensions	Instant availability of service with reduced manual labour	Ease of purchase at favourable terms due to bulk orders
No distressing sight of gas cylinders	Minimum cylinder handling hazards	Possible reduction in damages, breakages and losses
No irksome noises from movement of cylinders nearby	No chance of mix up of gases	Improved management and control

Implementation of centralised system depends mainly on the size of the hospital and may not be viable if bed strength is below 50 unless it is a super-speciality hospital.

1.6.2 System Elements

The medical gas delivery system consists essentially of the following elements:

- Source equipment
- Distribution (pipeline and fittings) system
- Terminal units at patient's end
- Alarm system.

1.6.3 Source Equipment

Source equipment are described below:

Banks of medical oxygen and nitrous oxide cylinders with cylinder manifolds: Oxygen is extensively used throughout the hospital, but nitrous oxide is mostly required in OTs and surgeries. The number of cylinders depend on the number of outlets provided and the intensity of their use in the hospital. Cylinder banks are duplicated to ensure supply continuity when one bank approaches exhaustion level. Oxygen and nitrous oxide cylinders could be of about 7.1 cubic metre capacity capable of withstanding a cylinder pressure of 140 to 150 kg/sq cm. Nitrous oxide cylinders will be less in number compared to oxygen cylinders and nitrous oxide is administered with adequate quantity of oxygen. Bacterial infection through contaminated oxygen and nitrous oxide can occur particularly when the ventilator equipment is unclean. The colour codes for oxygen cylinder is black body with white shoulder and for nitrous oxide cylinder is Persian blue. The manifold system controls the duplexed banks of gas cylinders and has automatic changeover device which is set to function with both banks of cylinders opened for use. One bank will be in "running" mode feeding the pipeline while the other bank is held in "reserve" mode. The manifold system monitors the supply condition constantly and when the "running" bank nears exhaustion,

contents of the "reserve" bank will automatically commence feeding the pipeline. Visual warning signals are also activated to indicate that one cylinder bank is empty. As soon as bank of cylinders becomes empty, it should be replaced with a set of fully-filled cylinders. Normally a change-over two or three times a week is acceptable. More frequent replacement may indicate the need for a bigger manifold or leakage of gas. First stage high pressure, high flow regulator connects to a common second stage regulator controlling the line pressure to 4.22 kg/sq cm (about 61 lb/sq in). All manifold units are sealed by authorized personnel. Nitrous oxide control panel incorporates a heating system to avoid freezing or condensation of the liquefied gas. Drop in pressure of nitrous oxide is extremely rapid as the cylinders near exhaustion level. A 64-oxygen cylinders and 8-nitrous oxide cylinders installation requires a manifold room of about 12 m x 5 m size. The room should have excellent ventilation and lighting, and should never be used to house the compressed air or vacuum unit. Empty cylinders and cylinders which are filled (full) should be stored separately in places earmarked for this purpose and should never be mixed up.

Compressed air unit: Primary use of piped breathing air is for inhalation therapy and in operation rooms, surgeries, intensive care units and in some specially selected places. It is used to run the ventilators and operate dental and orthopaedic drills and other pneumatic tools. Air must be both oil free and clean. Compressed air unit consists of an electrically driven air compressor possessing an after-cooler, air drier, air receiver (storage vessel which could be 3 metres in height) and other adjuncts for delivering the highest quality medical air. The unit is duplicated for reliability of service. Water is required for cooling the compressor in a high capacity unit. A 15-hp compressor of a 500-bedded hospital may require 40 to 50 litres of water per minute and a cooling tower to cool this water. Air pressure could be about 7 to 8.33 kg/sq cm (about 100 to 118 lb/sq in) at the compressor and this is reduced to about 4.1 to 4.33 kg/sq cm (58 to 61 lb/sq in) for use at the patient's end. The permissible pressure drop is about 0.35 kg/sq cm (5 lb/sq in). The compressor unit starts and stops automatically to maintain the pressure in the air vessel.

Vacuum unit: Vacuum is extensively used in most patient treatment areas, OTs and surgeries and in laboratories. In the surgical, recovery and intensive care areas, it serves to remove fluids from incisions and body cavities and is used in post-operative drainage. Its use in laboratories is for filtering, cleaning delicate apparatus and transporting fluids from one container to other. The vacuum unit consists of an electrically-driven vacuum pump to create a pressure much lower than atmospheric air pressure in a reservoir tank which could be 3 metres in height. This vacuum creates a "suction" effect at the patient's end. The unit operates automatically starting or stopping as required by means of a negative pressure switch and the vacuum pump can create quite a high vacuum. The unit is duplicated to ensure reliability of service. The reservoir tank stabilizes the vacuum pressure in the pipeline system somewhere between 305 mm to 635 mm of mercury at all outlet points. Care should be taken to ensure that vacuum (or suction) unit is not used in case of flammable anaesthetic agents (for scavenging and such-like purposes) which are soluble in vacuum pump oils. This is especially the case with OTs and surgery areas. Vacuum system is susceptible to misuse and abuse as it is temptingly convenient to get rid of pollutants etc. Therefore, this system should preferably be over-sized to ensure reliability. Vacuum pump room should be clean, especially the floor which should not have even oil stains.

1.6.4 Distribution System

The distribution system consists of pipelines, pipeline fittings and valves. Cleaned and degreased, non-arsenical, deoxidized, seamless solid drawn, half hard copper pipe of appropriate grade and standard are used in the delivery system. The pipelines are surface-mounted on walls at a height not less than 2.13 metres (7 ft.) or underside of roof slabs for ease of inspection and defect detection, and extend to various floors and wings of the hospital. Where they cross over to other floors, they should be covered by metal or plastic sleeves for protection. All piping (except maybe control line piping) should be identified by painting, tagging or by painted sign-boards. It is best to lay the pipeline away from all electric cables and wires, and avoid long vertical runs. Jointing is done with extreme care using fluxless silver brazing to obtain a leak-proof condition. Branch lines are generally provided with stop valves to enable them to be isolated from the main system for repairs. All valves should carry identification tags and a valve schedule should be prepared for ready information of all concerned and for permanent record purposes. After erection, the pipelines are purged and tested for pressure drop at a high pressure of one and a half times the normal

line pressure, i.e. 6 kg/sq cm using an inert clean gas. The sizes of the pipes used range from 10 mm to 76.1 mm outer diameter. All pipes are to be colour coded by painting as given below:

Medical Gas Pipeline Colour Code			
Medical gas	**Ground colour**	**First colour band**	**Second colour band**
Air	Sky blue	White	Black
Oxygen	Canary yellow	White	-
Nitrous oxide	Canary yellow	French blue	-
Vacuum	Sky blue	Black	-
Nitrogen (Used for powering turbo surgical instruments)	Canary yallow	Black	-
IS : 2379-1963			

It is important to note that copper pipes are reactive to cement mortar. Prior treatment will become necessary if they are to be embedded. The supports should be of copper or brass, but never of steel. The pipes can be epoxy coated. They may be taped if insulation effect is to be obtained.

Alarm devices are invariably introduced into the medical gases delivery system at judicious points in different zones of the pipeline network. These monitor pressure of gases and generate audio-visual alarm in case of abnormal pressures. An abnormal situation is indicated when the green light goes off and red light comes on. Audio alarm is effective in catching the attention of the maintenance man and is mutable. Its location should however be such as not to alarm the patients.

1.6.5 Terminal Units

The pipeline network ends in terminal units, which could be wall outlets or ceiling pendents. Self-sealing valve at the outlet point is fixed to the wall at a convenient place and is encased in a small rectangular shaped box labeled and coloured for instant identification. Its use is established as soon as a non-interchangeable safety keyed plug connector is inserted into it. Its usage ceases no sooner than the plug connector is withdrawn. Wastage is thereby avoided. Gas outlet points should be at least 20 cm away from electrical fitments which can generate electric sparks any time for whatever reason. Ceiling pendent reduces floor congestion and delivers the service at the place where it is required. Especially in operating theatres, it overcomes the nuisance of gas hoses and electric cables on or just above the floor which would be the case with wall-mounted outlets. The ceiling pendent incorporates electrical sockets also from where power can be drawn conveniently. The hospital has numerous patient treatment and care areas spread all over and provision of terminal units has to be decided with due care and consideration.

1.6.6 Liquid Oxygen System

In a large hospital, consumption of oxygen gas could be so high that oxygen cylinder replacement could become an inconveniently frequent exercise. In such a case, cylinder oxygen can be replaced by liquid oxygen which economises on storage and space. Liquid oxygen system involves vacuum-insulated white coloured pressure vessels, vapourisers, regulating and monitoring equipment. The equipment is designed with sufficient safety to store cryogenic liquid oxygen, transform it to gaseous form and supply it at a pressure consistent with medical requirements. Liquid oxygen is replenished by tanker carriers. The storage vessel should be housed outside the building but should have covered accommodation and follow stringent safety regulations.

1.6.7 Maintenance Tips

Centralised medical gases and clinical vacuum delivery system is unique to hospitals and so a few basic maintenance hints to hit the high spots as given in the cage below would be appropriate:

Basic Hints for Maintenance	
Equipment	**Action**
Cylinders and manifold room	Permit entry only to authorized persons. Prohibit smoking and naked light or fire. Tolerate no oil or grease patches on the floor. Maintain the premises clean, tidy, well lit and ventilated. Air compressor and vacuum pump should not be housed in this room.
Cylinders	Store filled oxygen and nitrous oxide cylinders separately. Store empty oxygen and nitrous oxide cylinders separately. Change empty bank of cylinders with fully charged cylinders containing the correct gas as soon as the red warning light appears on the manifold indicating one bank is exhausted.
Manifold	Permit only authorized persons to handle apparatus. Check that Unit is sealed by authorized person and is not broken or tempered with. Prohibit use of oil or grease on any part of the apparatus. Check for leakage frequently. Check that the central pressure gauge on the panel indicates 4.22 kg/sq. cm. (61 lb/sq.in). Keep the apparatus clean and shining.
Vacuum pump	If units are duplicated, operate units alternately (say, after every 300 hours). Do not tamper with the vacuum switch. Check the vacuum levels at which the unit starts up or stops automatically. All adjustments / repairs should be carried out by authorized personnel / supplier. Never spill oil or drop grease onto the floor. If it happens, remove it immediately. Air compressor should not be located in the vacuum pump room. Prohibit smoking and naked lights or fire in the vacuum pump room.
Air compressor	If units are duplicated, operate units alternatively (say, after every 300 hours). Keep inlet air filter clean. Compressor should suck in only fresh, clean air free from pollutants and odour. Never tamper with the air governor unit. All adjustments and repairs should be carried out by authorized personnel / supplier. Maintain the cooling tower in clean condition. Ensure adequate water supply. Do not spill oil or drop grease onto the floor. If it happens, remove it immediately. Vacuum pump unit should not be located in the air compressor room. Prohibit materials that exude smell (e.g. paints, oil, grease, kerosene, petrol and diesel, even food and eatables etc.) from being brought into this room. Prohibit smoking and naked lights or fire in the compressor room.
Pipelines and valves	Check for leakages and damage to pipelines. Check presence of identification tags and colour codes. If any pipeline has been altered or augmented, keep the same under close observation for sufficiently long time to ensure satisfactory performance. Check if any valves have been tampered with.
Terminal units	Check for leakages. Coordinate with all users so that they observe due care in using this service.
Documentation	Ensure proper records are maintained of all activities connected with this service.

1.7 LET US SUM UP

In this unit you have learnt that a hospital must have a building with spaces suitably planned in accordance with the requirements of the medical equipments and in compliance with the norms specified by several authorities, especially those concerned with safety. You also learnt that such an institution should have the fundamental facilities like reliable water and electricity supplies, dependable sanitation and drainage and so on. Further you learnt that the hospital has to deal with several government, semi-government and outside agencies to obtain water, electricity, fuel and gas supplies. Payment for these will have to be made as per prior agreements and these payments are high because a hospital is energy intensive. You would, therefore, appreciate the need for energy efficient functioning to cut down hospital expenses and make health care delivery system viable.

Towards the end you have learnt about various aspects of steam supply, Central Medical gases and clinical vaccum delivery systems.

1.8 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) 10

2) a) Poor efficiency

   b) Short life

   c) Gets stolen

3) Having a small pump at ground level to return the water in the down-take pipe to the storage tank and thereby keep up hot water circulation.

Check Your Progress 2

1) one kilowatt-hour.

2) frequency (cycles/second) of alternating current.

3) Essential load is supplied with electricity generated by the stand-by generating set and by segregating it from the total load the generating set capacity is reduced with savings in expenses. Non-essential load is connected only to the mains supply.

4) a) Stand-by generating sets supply

   b) Emergency batteries supply

   c) Uninterrupted Power Supply (UPS) system

Check Your Progress 3

1) bicarbonates, sulphates, chlorides and nitrates of calcium and magnesium.

2) Alkaline.

3) Disinfection of water to make it fit for human consumption.

4) Two days requirement.

Check Your Progress 4

A non-IBR boiler is one that does not come under the purview of Indian Boiler Regulations.

Check Your Progress 5

1) a) inhalation therapy and operation of pneumatic tools.

   b) removal of fluids from incisions and body cavities.

2) One bank is used at a time and the other is held as reserve to be used when the first bank nears exhaustion level.

Relevant Indian Standard Specifications and Codes.

UNIT 2 ALLIED ENGINEERING SERVICES

Structure

2.0 OBJECTIVES

After studying this unit, you will be able to:

- explain the overall engineering services of a hospital;
- understand the need and the role of hospital engineering services department; and
- analyse the importance of maintenance and energy conservation.

2.1 INTRODUCTION

This unit is an extension of the previous Unit and you will learn about certain allied services which are basically engineering in nature and factors governing them.

While going through the preceding Unit, you must have become aware of the basis of the subject.

In this unit, you will learn about the engineering services department and how it can become the hub activity of all Engineering Services. In the beginning of the unit you will learn about the air-conditioning and refrigeration in a hospital. Thereafter you will learn about non-conventional energy devices for conservation of energy in a hospital set up. Further you will learn about the maintenance operations and stores management including workshop facilities and engineering service department.

2.2 AIR-CONDITIONING AND REFRIGERATION

Planet Earth is bestowed with seasons and weathers that change for the benefit of mankind. But they are not always favourable or comfortable to the sick and suffering patients. Moreover, bio-medical equipment used extensively in hospitals are sensitive to changes in the environment qualities and are likely to lose their accuracy or even fail. Therefore, there is a necessity to control the environment inside a building to suit the needs of patients and the equipment.

2.2.1 Air-conditioning

Air-conditioning is the act of creating an artificial climate by making the air just right for use in a building by making it colder or warmer, by drying or moistening it and by cleaning it. Air-conditioning therefore controls temperature, humidity, cleanliness and movement of air in such a manner as to assist patients in recovering and equipment in functioning satisfactorily with the desired accuracy. It is a common practice to refer to this activity as heating, ventilating and air-conditioning, or HVAC for short.

2.2.2 Air-conditioned Areas

It is certainly advisable to air-condition the entire hospital to achieve freedom from dust and high sterility conditions. But this is too costly a system and economic considerations often lead to curtailment of air-conditioning.

The following departments and wards have been recommended to be air-conditioned in IS: 10905 (Part-3)–1984:

- Operation theatre complex in emergency and casualty departments
- Intensive care units

- Radiography and radiotherapy rooms in radiology department
- All rooms in sterile zone of delivery suite
- Certain laboratories in pathology department
- Blood laboratory in bood bank of OPD
- Fracture-cum-casualty theatre, recovery, frozen section of clean zone and all rooms in sterile zone of operation theatre department
- Certain number of beds in wards, units of particular specialities
- Autopsy room in mortuary.

With advancement in technology and treatment procedures, many more areas may need to be air-conditioned. This is best decided in consultation with the equipment suppliers. Super-speciality hospitals will no doubt have maximum air-conditioning with a few areas like toilets excluded.

2.2.3 Temperature and Humidity

Temperature is the degree of hotness as measured by a thermometer. The normal body temperature is 37°C (98.6°F). If the air temperature is slightly lower than this, the human body dissipates heat at the correct rate and the patient feels comfortable.

Atmospheric air is never dry, but contains moisture always. Moisture content in air is measured in grains and 7000 grains make one pound (453.5923 grams). Humidity pertains to the presence of moisture as water vapour in air. Relative humidity (RH) is the amount of water vapour in the air expressed as a percentage of greatest amount that air can hold at that temperature. On cold mornings, there can be mist in the air, because air is unable to retain the quantum of moisture present in it at that low morning temperature and throws out the excess as mist. The relative humidity would then be 100%. Under these conditions, sweat from the skin can not evaporate into the air, because the air is already saturated with moisture. In humid weather, a person appears to sweat profusely because the sweat is not evaporating off the skin. The person feels uncomfortable. In dry conditions, moisture on the skin evaporates quickly making the skin dry and the most common experience is parched lips. If the relative humidity of air in an operating room is low, then there is every possibility that body tissues in the open cavity could dry up which would be dangerous.

Thus there is a relationship between comfort temperature and relative humidity. Comfort conditions for summer (cooling) and winter (heating) have been recommended in IS:659-1964 and a modified version is given below:

Inside Comfort Design Conditions			
Summer		Winter	
Temp. °C (°F)	RH %	Temp. °C (°F)	RH %
22.3 (74)	68.0	21.4 (70.5)	68.5
23.9 (75)	56.5	21.7 (71.0)	62.5
24.4 (76)	48.0	22.2 (72.0)	52.0
25.0 (77)	38.7	22.8 (73.0)	45.0
25.6 (78)	33.0	23.3 (74.0)	33.0
26.1 (79)	24.0	23.6 (74.5)	21.3

Note : It is difficult to obtain RH below 45% by air-conditioning alone.

Medical evidence has shown that proper air-conditioning is beneficial in preventing and treating many conditions. Some examples are the following:

- Better treatment of rheumatoid arthritis has been achieved in a hot (32°C or 89.6°F) and dry (35% RH) condition
- Burn patients may need treatment in hot (upto 32°C or 89.6°F) and humid (upto 95% RH) conditions
- Patients with chronic pulmonary diseases may need warm and humidified air to prevent dehydration

- Patients with thyrotoxicosis need cool and dry condition
- Those with hyperthermia need a cool room with low humidity level
- Dry conditions are not favourable to the ill and debilitated. It contributes to secondary infection.

In case of air-conditioning for equipment areas, the inside conditions should be decided in direct consultation with the suppliers of the medical equipment at the time of procurement.These conditions differ as the examples in the following table show:

Temperature and RH Environment Examples for Medical Equipment

Equipment	Make	Temperature Range	RH
Radiography/Fluoroscopy	Siemens	10 to 24°C (50 to 75°F)	30 to 75 %
	GE	13 to 24°C (55 to 75°F)	20 to 80 %
MRI 1.5 Tesla	Siemens	16 to 21°C (60 to 70°F)	55 to 65 %
	GE	10 to 21°C (50 to 75°F)	30 to 60 %
Linear Accelerator	GE	22 to 25°C (71 to 75°F)	30 to 70 %
	Varian	16 to 27°C (60 to 80°F)	15 to 80 %
CT Digital	Siemens	21 to 24°C (69 to 75°F)	35 to 70 %
	GE	20 to 28°C (68 to 82°F)	40 to 70 %
	Picker	20 to 24°C (68 to 75°F)	30 to 60 %

Ambient conditions at numerous cities have been recorded for several years and have been moderated to arrive at the values suitable for adoption in air-conditioning calculations. The following table is an illustrative example and highlights the necessity for air-conditioning when co-related with the conditions for human comfort and equipment operation:

Ambient Conditions adopted in Air-conditioning Calculations

Location			Summer		Monsoon		Winter	
	Place	Heigt above MSL, m	Temperature °C (°F)	RH %	Temperature °C (°F)	RH %	Temperature °C (°F)	RH %
Coastal (hot/sultry)	Calcutta	6	37.8 (100)	49	32.2 (90)	85	13.3 (56)	55
	Chennai	16	39.4 (103)	41	28.3 (83)	88	18.3 (65)	60
	Cochin	3	35.0 (95)	58	29.4 (85)	88	22.2 (72)	69
	Mumbai	11	35.0 (95)	60	29.4 (85)	88	18.3 (65)	65
	Thiruvananthapuram	64	33.3 (92)	59	29.4 (85)	80	22.2 (72)	69
	Vizag	3	33.3 (92)	64	30.6 (87)	80	18.3 (65)	60
Interior (hot)	Ahmedabad	55	43.3 (110)	34	32.2 (90)	82	15.6 (60)	60
	Bangalore	921	35.6 (96)	45	27.8 (82)	82	14.4 (58)	78
	Bhopal	523	41.4 (106)	20	33.3 (92)	69	7.2 (45)	50

	Lucknow	111	42.8 (109)	26	34.4 (94)	64	8.9 (48)	60
	Patna	53	42.2 (108)	26	32.2 (90)	78	10.0 (50)	60
Elevated (cold)	Shillong	1500	29.4 (85)	50	23.3 (74)	82	3.3 (38)	50
	Srinagar	1586						

2.2.4 Air-conditioning Load Factors and Design Parameters

Several factors contributed to the air-conditioning load. They are as follows:

- **Conducted load:** Heat from outside in case of summer cooling and heat from inside in case of winter heating is conducted by walls, floor and roof. This is greatest in case of exposed roofs.
- **Occupancy load:** Persons inside the air-conditioned space give off heat which depends on the degree of their activity.
- **Lights and user equipment load:** Lights emit heat and all equipment give off heat when in use.
- **Ventilation load:** All materials exude smell which should be expelled. Occupants need oxygen and fresh air. Therefore hot outside air is internationally inducted into the system which adds to the air-conditioning load. If a quantity of outside air whose volume is equal to the room volume is inducted every hour, then the number of fresh air changes would be one per hour. This is actually the practical minimum since opening and closing of doors results in outside air leaking into the air-conditioned space. In case of operating rooms, the number of fresh air changes could be 10 per hour or more. It could even be "all fresh air system", also called "blow through system". This imposes the greatest load on the plant.

Air-conditioning services design requires the following basic information at the very outset:

- Inside temperature and humidity with permissible drift thereon
- Number of fresh air changes per hour (or indoor air quality)
- Occupancy and their activity level
- Users equipment load and details thereof
- Number, wattage and type of lights
- Air purity level
- Working hours per day
- Necessity for warmth heating in winter

Further, the following additional information becomes essential in case of hospitals:

- Whether positive or negative air pressure is to be maintained in any particular space
- Whether re-circulation of air is permissible
- Whether all fresh air conditions is inescapable
- Whether inside air from a particular space needs to be exhausted to outside safely
- Whether air is to move into or out of any specified space
- Whether laminar flow conditions are required in any particular space.

Air-conditioning is vulnerable to too many factors having a direct and serious impact on its performance. One common factor is a half bright - half brown condition about the ultimate design burdens and the final resultant site realities including usage of space and equipment therein. More often than not, only rough details of equipment will be available in the beginning on which the air-conditioning design is finalized. Much later, the parameters get altered when the actual equipment to be purchased is finalized. It is important that the first step of defining the design parameters is taken with due care and finalized in great detail.

Based on the design parameters, heat load calculations are carried out for the summer and monsoon seasons. The higher capacity out of the two is selected. Sometimes the monsoon load is greater than the summer load.

2.2.5 Air-conditioning Plant

Major part of this plant consists of a refrigeration unit. The cold produced is transferred either to circulating air directly or to circulating water, which subsequently cools the circulating air. The former is called as Direct Expansion (DX) System and the latter as Chilled

Water System. In both cases, the cooling of air takes place in a part of the plant called air handling unit (AHU). The AHU houses the air filter, cooling coil and air blower which circulates the treated air through the air-conditioned space. Air ducts convey the air to and from the AHU. For best performance, the air duct length should be limited to 30 m (100 ft). The DX system plant can handle only one AHU whereas the chilled water system plant can have as many AHUs as necessary.

This limitation of the DX system plant to handle one AHU is a disadvantage in case of hospitals as they will then need several plants working in different places with increased plant operating manpower. On the other hand, one big central chilled water plant could serve the whole hospital through several AHUs placed judiciously near to the load points. It would be advantageous to place areas needing air-conditioning together in a group so that, inside conditions permitting, one AHU can serve them all effectively.

The air-conditioning plant capacity is specified in tons (or tonnes) of refrigeration (TR). This actually denotes the heat extraction capacity of the plant and has nothing to do with weight. One ton of refrigeration is equal to a heat extraction rate of 12,000 BTU (British Thermal Unit) per hour (3024 kilocalories per hour).

Room air-conditioners (generally called as window type air-conditioners) are a common sight and come in several capacities starting from a fraction of a TR and extending upto 2.5 TR. These are DX systems and give comfort cooling. A one TR unit can suffice for a room upto 12 sq m. Multiple units can be used for air-conditioning larger areas. They need electric supply and a little quantity of water in a small tank to increase their cooling effect. They condense out moisture from the air which has to be drained out properly. Latest units are technologically advanced with energy saving devices and attractive looks. Any MCB used in this electric circuit should be of "G series" with adequate rating. Packaged air-conditioners are also DX systems with a capacity ranging from 3 to 15 TR. They need electricity and water if the unit is water-cooled. Single units can air-condition much larger areas and multiple units can be used to advantage.

2.2.6 Central Chilled Water System

This is a versatile system and is best suited for hospital use. One single plant can serve the entire needs of the hospital, thereby cutting down the manpower. Even a big plant can work efficiently on part loads as low as 10% and offer huge energy savings. Chilled water pipes are adequately insulated and appear huge in size. Each AHU can be specially designed and selected to perform to meet the requirements of the spaces that it serves. In wards and common areas, fan coil units can also be used. These are small cooling units upto 2 TR capacity and are slung from the roof. Like room air-conditioners, these also condense out moisture from the air and the condensate will have to be drained out properly.

2.2.7 Testing of the Plant

After installation, the air-conditioning plant is tested on full load during the hottest days in summer and wet days in monsoon. These seasonal tests may last for three days as per prior agreement and the results are authenticated by the executing agency and the client.

2.2.8 Power and Water Requirements

Air-conditioning plants are power hungry and need huge power input. Since they work almost round the clock, the power consumption is rather huge. Big plants above 100 TR may take about 2 kVA per TR and the smaller ones in excess of it.

Water is required for condenser cooling. The resultant hot water itself gets cooled in cooling towers. A big plant could require as much as 200 litres per TR per day.

2.2.9 Fire Dampers

Air ducts offer excellent passage to fires for easy propagation and spreading to other areas. To prevent this catastrophe, fire dampers are inserted in the air ducts. These are actuated to close and block the air passage by fire detectors in the event of a fire. They could also be closed by fuse links which melt when the fire heat reaches them.

2.2.10 Air Filtration

This is one of the duties of the air-conditioning AHUs. Rough coarse filters prevent insects and large particles from entering the AHU. The next higher grade is the micro-vee filter which

is effective down to particulate size of 5 microns, one micron being one-millionth of a metre or one-thousandth of a millimeter. High efficiency particulate air filters (HEPA filters) can filter down to 0.3 microns with 99.97% efficiency. These are very costly and have to be installed with extreme care as even a pin point puncture will cause an air leak to upset its efficiency and effectiveness. These are mostly used in operating rooms to eliminate bacteria carrying particles. HEPA filters have to be replaced at frequent intervals which may not be longer than six months.

2.2.11 Air-conditioning of OT

This is an intricate task the details of which are described in Unit 3 on Operation Theatre, (Block 1, Course 4).

2.2.12 Caution and Common Mistakes.

Air-conditioning plants use a refrigerant gas belonging to the chlorofluorocarbon (CFC) family. This gas, when leaked, could rise up in atmosphere and deplete the ozone layer protecting the earth from harmful rays of the sun. Use of such a refrigerant gas will be discontinued in the near future. Alternative safe refrigerant gases are available. Therefore care should be taken to see that the air-conditioning plant selected for the hospital works with a safe refrigerant gas. This aspect is of utmost importance, as otherwise a costly plant will be rendered idle in the near future tantamounting to an unbearable loss.

Air-conditioning works will probably be the last to start. Being a "late comer" as it is, it is not likely to be completed when the user equipment arrives at site. This situation is common. Air-conditioning service should be taken up well in time and be ready in all respects with ducts vacuum cleaned and free from dust.

Some of the common mistakes are as follows:

- User requirements are not fully established and appreciated.
- Incorrect load estimation is done and plant capacity proves to be inadequate.
- An oversized plant may not perform satisfactorily if the individual components are not matched correctly.
- Finish of the plant is not upto the mark. Duct and air grilles works are shabby.
- Adequate spares backing is not provisioned. Technical and operating manuals are not provided.
- Operators are not trained properly.
- Electric works are not executed as per rules and standard practice. They are given secondary importance and even safety is compromised with unprotected cables near floor level.
- Summer, monsoon and winter seasonal tests are not conducted with due care and promptness.

2.2.13 Winter Heating

Areas like OT, ICU, Nursery, Emergency, selected wards, selected areas of pathological laboratory need heating in winter. This could be achieved by using a hot water generator and a pump to circulate the hot water through the AHU concerned.

2.2.14 Desert Coolers

Cost dictates that air-conditioning be restricted to essential areas. For other areas like general wards, waiting rooms and so on, desert coolers could be used to provide some degree of comfort. These are somewhat noisy and messy, but are cheap in capital cost and are economical to operate. They work best in hot and dry areas; and create very humid and damp conditions.

2.2.15 Refrigeration

Refrigeration produces cold, but is not primarily meant to circulate air like the air-conditioning plant. So also, the temperatures attained are very much lower than in air-

in pathology and cold storage plants in dietary department, pathology, medical stores and mortuary. They are sometimes called as "reach-in", "walk-in" and "under-the-counter" units. They work on electricity and some cold stores of bigger size may need water for condenser cooling. All these items should be maintained in spotlessly clean condition without any stains inside and outside. Bottle coolers also may be provided in kitchens and cafeterias. All electricity consuming apparatus and equipment must have a clear space of at least 60 cm (2 ft) all around to provide adequate ventilation and for ease of maintenance. Refrigerators and water coolers are no exception. Placing them closer than 60 cm (2 ft) to walls or in a close-fitting niches are not good practices and should be avoided. A walk-in cold room for storing medicines, vegetables, bread, eggs, kitchen left-overs etc. could have a temperature of 4 to 10°C (39 to 50° F).

2.3 NON-CONVENTIONAL ENERGY DEVICES

Prehistoric man must have basked in sunlight for warmth. Later on he learnt to light fires with wood and burnt leaves for cooking purposes. Then he discovered coal and petroleum fuel to obtain energy. Potential energy in water was harnessed in water turbines. Availability of energy made industrial revolution a reality, which in turn laid heavy demands on energy. But these natural sources of energy are not as abundant as they were once thought to be and their depletion rate has been phenomenal. The time left is too short, maybe 50 years, before coal and oil shall not be available at all. This has created the alarming prospect of life amidst dwindling resources in the near future. "No energy is more expensive than no energy", Dr. Homi Bhaba had prophesised. This frightening scenario has given an impetus to the search for new sources of energy that is not conventional, but renewable and inexhaustible– the non-conventional energy. This is an extremely advanced hi-tech field.

2.3.1 Conventional and Non-conventional Sources of Energy

The present day conventional sources of energy are wood and combustible wastes, coal, hydro potential, petroleum products and the like. Electricity is also a source of energy, but it is a secondary energy having been produced from one of the conventional sources. These are the sources of energy which need to be conserved by harnessing other forms of renewable energy.

Our country is bestowed with a smiling bright sun over most of its expanse for a major part of the year. It has a long coastline. The wind conditions are as good as anywhere else, if not better. Why then should we not harvest this renewable new energy from the wonders of nature?

Various sources of inexhaustible non-conventional energy for our consideration are the following:

- Tidal waves

- Micro and mini hydels
- Bio-mass
- Solar (thermal)
- Solar (electrical)
- Wind (electrical)
- Wind (mechanical pumping)

2.3.2 Bio-gas Plants

Alternatively called as Gober Gas Plants, these use cow dung to produce gas which can be directly used for cooking food or can be made to run modified diesel engines to power pumps or generate electricity. They consist of a huge-sized digester of masonry construction into which cow dung slurry is fed at intervals and a big steel drum resting over the digester pit to collect and store the released gas. Several plants have been installed all over the country, but their performance is in doubt. These plants need regular attention in collecting and preparing the slurry using ample quantity of water, and then feeding at the correct pace. Disposing off the muck after use is another exercise. Unhygienic conditions and mosquitoes nuisance are likely to result. In winter, the output drops by as much as 40%. Use of bio-gas plant is not a favourable proposition for any urban hospital due to the forgoing reasons. At best, they may be considered for the rural hospitals as a fillip to the local population to adopt this system whose end product can manure the fields.

2.3.3 Solar Energy

Sun is the most natural source of energy for this planet and even grand mothers are aware of this fact as they put out washed wet clothes (or even cow-dung cakes) and certain cooking materials to dry out in the sun. Heat from the sun evaporates surface water to shower rain over most parts of the globe and salt is gained from sea water using solar energy. Why, even in modern times, the sun provides energy to satellites orbiting the earth. In India, the density of solar energy is equivalent to 4.5 to 7.5 kWh per square metre per day on a sunny day. But the beneficial utilization depends on the number of sunny days and in practical tracking of the sun like a sunflower.

Solar energy can be harnessed for the following purposes:

- For producing distilled water
- For cooking food
- For space heating
- For heating water
- For generating steam to produce electricity
- For generating electricity directly

2.3.4 Solar Stills and Cookers

Solar stills are devices for evaporating water, generally brackish water, and then condense the water vapour to yield theoretically distilled water. The resultant water will be fit for industrial use (example battery topping up) and possibly for drinking also after conducting due tests. But the output is so meagre and the space occupied so large that its utility for hospitals is not recognizable.

2.3.5 Space Heating with Solar Energy

One method of heating buildings is by using solar thero-symphon air panel (TAP) collectors. This consists of toughened glass sheets, black chrome-coated copper absorbers, plywood and excellent insulation material, air ducts with dampers for controlling the air flow. Temperature control inside the building is achieved by changing the air flow rate. This system has been used in a few locations in India, but of course, they must be the predominantly cold places.

2.3.6 Solar Water Heaters

This is one field in which considerable experience and confidence have been achieved

oriented to face the sun to best advantage throughout the day. Banks of flat plate collectors connected in series and in parallel will have to be installed in case of hospitals and favoured sizes are those in the output range of 100 to 160 litres per day of hot water each at about 60 to 70°C (140 to 158°F) during peak sunshine and 30 to 40°C (86 to 104°F) during diffused sunshine hours. Water storage tank supplies water to the collectors at the bottom end and hot water is tapped off at the top end to be stored in a well-insulated tank. The flow of water takes place automatically due to the temperature gradient created by the heating process. Hot water storage tanks should have the capacity to store at least one day's requirements. Water should not be hard otherwise scaling and clogging of collector passages will occur. Performance of this system depends on the sun strength, rate of draw-off and quality of maintenance of the collector. To ensure adequate quantity of hot water at the correct temperature especially on cloudy days or excessive consumption in early morning hours, supplementary electric heating has to be incorporated into the system with thermostatically controlled heating elements. All these are generally mounted on roof top of the building and occupy considerable space. Hot water from the storage tank is brought down by vertical down-take pipes with a tee off arrangement at each floor. Entire hot water piping is adequately insulated. In one design, the heat collector and storage tank are combined into one modular unit which saves space.

In the system described above, water is directly heated in the flat plate collector. An advanced system employs indirect heating in which a specially developed fluid like propylene glycol, which is a food-grade, non-toxic heat transfer fluid, circulates in a closed circuit through the multi-flow collector and becomes hot. This fluid possesses better heat absorption qualities than water. This hot fluid then circulates through a jacket in the hot water storage tank and heats the water contained in it. The fluid does not cause scaling of the collector passages which water will do especially if it is hard. Two layers of protective ceramic coating line the storage tank to prevent corrosion. This system is costlier, but performs better.

You must go through the information on hot water supply system given in sub-section 3.5.2 of Unit 3 of this block wherein the arrangement for avoiding wastage of hot water is explained. The same is applicable to this case also.

Whilst their virtues of energy saving and causing no atmospheric pollution or usage of oxygen admit of no controversy, they still suffer from the disadvantage of greater maintenance effort and large space requirement. The inescapable need for supplementary electric heating is also a prominent minus point. Space heating can also be done with the hot water from solar water heaters, but this would be effective at best for a few hours during day time in small hospitals.

2.3.7 Electricity Through Steam

High-density solar heating can be achieved by using the thermo-syphon air panel (TAP) collectors to generate steam. This steam could then be used for electricity generation. However, this system is so intricate that a hospital can hardly be expected to devote their energies to operate it.

2.3.8 Electricity Through Photovoltaics

Photovoltaic cell was a remarkable discovery of converting light directly into electricity by two different materials in contact which produce electricity when light was incident on them. In modern parlance, the photovoltaic cell is a semiconductor device that converts light energy into direct current electricity. You would have noticed that most pocket calculators have photovoltaic cells which powers the calculator in day time to prolong the life of the normal battery inside the calculator. The power generated depends on the strength of the solar rays incident on the panel and therefore needs to be stabilized before use. Photovoltaic arrangements can be used to advantage for charging batteries, pumping water, domestic and street lighting and several other purposes. For best performance, they need an effective sun tracking system, and a huge and costly battery bank for storing electricity. They need careful handling and frequent cleaning. Their life expectancy is almost 15 years if they are not subjected to physical damage. But this is offset greatly by the shorter life of 3 years for the batteries. The tracking system also needs high grade technology and attention. The whole photovoltaic array will need considerable space without shadows. This is a very costly system, which goes to sleep at night and can be considered for ameliorating a situation where no other source of electricity is available.

2.3.9- Wind Power

Windmills in yester years were picturesque and were the source of power to pumps to irrigate the agricultural fields. Technologically advanced windmills of today can operate with wind speed of 16 km/hr and over, and generate a respectable quantum of electric power or pump water from deep bore wells. The present day metallic windmills are aerodynamically perfect and are attractive proposition for power generation provided they are used in large numbers in a "windmill farm" located in a large open area with good wind conditions for a greater part of the year. These are imported and are quite costly which hospitals will find to be most discouraging.

2.3.10 Final Picture

Solar and wind energies are two of the most abundantly available non-conventional energy sources and seem attractive for harnessing. Solar radiation could be used directly as solar thermal or be converted to electrical energy. Wind power could be used directly as mechanical energy derived from windmills which rotate slowly or can be converted into electricity in wind turbines which rotate at higher speeds. But all these are location sensitive, and need accurate wind chart and site data for taking proper decisions to make a success of the project. Induction of non-conventional energy devices in hospital projects is also dependent on whether the hospital is a rural or urban one.

For rural hospitals where electric power is either in short supply or is totally absent, organic power generation will have to be resorted to. This could be supplemented with electricity from photovoltaics and wind turbines. Pumping of water could be done by windmills, thus relieving the load on the generator. Bio-gas plant could supply fuel for cooking, as cow dung raw material is likely to be available in sufficient quantities. Solar water heater could supply hot water with resultant saving of electric power. Photovoltaics with battery endurance can ensure lighting even at night.

In urban hospitals, where space will be a major problem and pollution constraints are severe, it would appear that solar water heaters located on the terrace of the hospital building can only be used. Power generation through photovoltaics will be costlier than with captive generation and would therefore not be an attractive proposition.

All said and done, one has to accept the sad reality that alternative and renewable sources of energy possessing tremendous potential have not been able to make their presence felt for a long, long time.

2.4 ENERGY CONSERVATION

All hospitals are energy intensive propositions. The more modern or super-speciality it is, the more the energy consumption. You appreciate that a hospital has to work 24 hours a day, seven days a week throughout the year, and therefore the quantum of energy consumed and its cost are phenomenal. Hospital's primary role is to render services to the patients economically and still be viable. Towards this end, energy savings or conservation becomes a dire necessity. You have already been introduced to this topic through intelligent buildings covered in sub-section 1.2.10 of Unit 1 and we can proceed to examine the ways and means of conserving energy.

2.4.1 Energy Saving Possibilities

Energy saving is the sure way to reduce expenditure and is essential for hospitals to be economical and stay competitive. We cannot escape the fact that energy saving is very much possible at every place and in every function of the hospital. Take a simple example to start with.

Leaking tap is a familiar sight. Water is reaching the tap from the storage tank placed on the building roof. It reached the storage tank because a pump pumped it using energy. Thus it is energy that is leaking to waste through the tap. Yet hardly anyone bothers to stop the flow and loss of energy even though it takes only a flick of the wrist. Remember— "Little drops of water make the mighty ocean".

2.4.2 First Steps to Conservation

The example highlights the important aspect of neglect, probably through ignorance. Energy conservation begins with awareness and personal involvement of one and all. Success depends on widespread and total co-operation from all the personnel. They should be made to realise the importance and be motivated in this effort by the management.

In case of hospitals, energy consumed is in the form of electricity and fuel oils. Cooking gas is also another source of energy. All these have to be obtained at considerable expense. Their end use is air-conditioning, stand-by power and steam generation, medical and other equipment, internal lighting and ventilation and so on.

Everyone in the hospital premises must spare a thought to many simple things that have been taken for granted or have been accepted over a long period of time. A few examples are as follows:

- Is the use of light really necessary? Is the fixture clean?
- Can the incandescent light be changed into a lower wattage fluorescent tube?
- Is the use of fan really necessary? Can its speed be reduced?
- Have the fan and regulator been maintained?
- Is the temperature in the air-conditioned room too low forcing the use of blanket?
- Are the doors and windows of the air-conditioned space properly closed? Any window glass is broken?
- Was it necessary to use the lift when the staircase could have been used?
- Are high-energy consuming items like heaters, sterilizers, etc. being used optimally and not unconcernedly?

Answers to these questions should prompt the person to take necessary action that is called for to stop the energy drain and help the hospital.

2.4.3 Other Issues

Many possibilities exist to facilitate energy savings. Some of them are as follows:

Electricity: Street and area lighting could be switched off selectively on a few days before and after the full moon day. On other days, some of them could be switched off after mid-night when the movement is not intensive. A good maintenance level in electric motors will reduce friction and heating effect which in turn will manifest in improved efficiency and lower power consumption. Water coolers too can be switched off during night hours to save electricity.

Stand-by generating sets: All hospitals will have stand-by generating sets and bigger ones have high power sets. Their fuel consumption is considerable and fuel costs are increasing regularly. Leakage and wastage of fuels should not be allowed to occur. The sets should be maintained well. Even cleanliness of the cooling and exhaust systems and good ventilation of the room will result in fuel saving. Only the essential loads should work off the generating sets with non-essential loads isolated from the supply.

Air-conditioning: The plant consumes huge amount of electric power made worse by prolonged duty hours. In a system which is well-designed and cared for, energy saving will be difficult without compromising on patient care. In this case, maintenance effort should not

only be in the plant room, but also in the air-conditioned spaces to ensure that no unnecessary loss of treated air and no unaccounted heat gains occur.

Water Supply: Leakage at the tap end has been mentioned, but consider leakages from sumps, reservoirs and storage tanks and delivery mains. Another common occurrence is the overflow from the storage tanks. All these fall into the same category of energy loss.

Compressed air, vacuum and steam: Leakages are generally overlooked or corrective action delayed as the systems cannot be shut down. Losses are considerable and mount minute by minute.

There are several serious areas of energy loss which should be tackled at the right time. Most of them concern planning, design and equipment selection. Simplest cases are the following:

Building and environment: Hospitals have considerable areas air-conditioned for technical and comfort reasons. Proper orientation of the building, use of materials having lower heat conductivity properties, limiting sizes of glass windows and positioning them where the sun is not incident on them and so on will reduce air-conditioning and ventilation loads. A good horticulture and arboriculture effort will also achieve the same results.

Equipment selection: Installing oversized equipment to play safe results in energy loss. Similarly economizing on pipe or cable sizes to reduce initial costs create eternal energy loss. Modern technology has many energy efficient items and machines to offer which should be taken cognizance of for deriving cost benefits.

Operation and maintenance: Machines should be operated as stipulated in their manuals by the manufacturers or suppliers. Incorrect operation is inefficient operation with resultant energy loss. Unnecessary operation is another huge energy drain. Improper or infrequent maintenance is an enemy of efficiency and should be avoided.

Life of equipment: Wear and tear is inevitable when an equipment is used. Depreciation is also inevitable even when the equipment is not used. But an old equipment continues to be used with a little extra expenditure on repair and maintenance because it is cheaper than the capital cost of energy efficient modern equipment. Specialist opinion is required in these cases as to when a more efficient new one best replaces an existing old item.

2.4.4 Energy Conservation and Maintenance

When we find that cycling is tiring more than usual, the first thing we do is to oil the chain and hubs and pedals hoping the cycle will run smoothly and we can save our energy. Give an example of a household item which gets the same treatment under the same condition. We can now recognize the relationship between energy conservation and equipment maintenance as the two go hand in hand. A simple tabulation will help in better understanding of this issue.

Energy Conservation with Maintenance	
Conservation aspect	**Maintenance action**
Equipment operating longer than usual	Check and repair control devices
Equipment overload	Check for unauthorized loads and/or leakages, blockages
Equipment drawing more power	Check for overloading, loss of lubrication, increased friction
Reduced receipt at end point	Check for leaks, blockages, physical damage of lines
Generating set draws more fuel	Cooling system defective, overloading, poor lubrication, poor ventilation
Generating set overheats	Cooling system not properly maintained, overloading, poor room ventilation
Excessive air-conditioning load, plant overloaded or operates longer than usual	Check for leakage in air-conditioned spaces, extra equipment load, cleanliness of cooling coils, closed dampers in ducts, obstruction to air grilles
Lighting load heavy	Clean light fittings which are dirty so that illumination level improves
Conservation insufficient	Keep eyes open and observe to spot fresh prospective areas

2.4.5 Conservation by Heat Recovery

Some plants reject lots of heat to the atmosphere during their operation. A good example is the generating set whose exhaust gases carry away considerable heat to the atmosphere. This heat can easily be used for heating water and the resultant hot water fed to the boiler. Heat, which would otherwise have been lost to the atmosphere, is reclaimed and put to good use. Another example is the hot water flowing out of some of the laundry machines which uses steam or electric heating while working. This heat in wastewater can also be profitably reclaimed. The hot flue gas from the incinerator is another possible useful heat source. Conservation by heat recovery is a specialized field and extensive studies are required before embarking on a heat recovery plan.

2.4.6 Energy Conservation Management

The question most difficult to answer in case of hospitals is – "Is the energy consumption appropriate for this hospital?" This can only be tackled if certain steps have been taken to collect detailed information from numerous action points in the hospital over the past years. Metering electricity consumption at all major points is the first step. Recording of operation parameters of generating sets, steam boilers using fuel oil and the like are a necessity. Fuel consumption figures should be available in detail. Induction of new bio-medical and other energy consuming equipment should be known. Details about purchase of medical gas cylinders should be available. Many others could be added to this activity.

In sum, an effective hospital MIS supplemented by cost accounting details will help in analysing the energy scenario. A log set up by month and type of expenses with columns showing the previous years figures against those of the current year will encourage a meaningful comparison and clarify exactly what is happening. This exercise can reveal the truth.

2.4.7 Caution

Hospitals can and have to reduce their energy consumption and thereby energy expenses through forceful management procedures. But this economy action should not lower the standards of health care delivery to the patients and should not compromise on comfort, security and safety. The main theme behind energy conservation is to reduce waste and losses, but not to reduce the functional aspects of the hospital.

Check Your Progress 3

2.5 MAINTENANCE OPERATION AND STORES MANAGEMENT

All items that are produced or created invariably undergo deterioration while working or standing idle and will need maintenance for their upkeep. Maintenance is an integral part of efficient and reliable functioning of any item, be it a civil asset like buildings and roads or a mechanical or electrical or electronic one. Proper maintenance operations are vital in a hospital which depends heavily on its buildings, bio-medical equipment and engineering services in caring for the sick and in health care delivery. Maintenance can only be sustained by supply of quality stores on time. These two are therefore related issues. Let us consider them one by one.

2.5.1 Maintenance Categories

Consider the use of a scooter. The seat, handle bar and probably the body are wiped with a cloth before first use of the scooter on any day. This is routine maintenance. The scooter is handed over for servicing every month or so. This is planned maintenance. Before embarking on a long trip, the scooter is subjected to a thorough check and suitable action taken to replace weak and worn out parts to prevent a possible breakdown on the way. This is preventive maintenance. A puncture on the way renders the scooter unusable till the wheel is replaced. This is breakdown maintenance. Replacing of tyres after completion of a

certain mileage would be predictive maintenance. After a long use, the scooter engine is opened up for de-carbonizing and cleaning of internal parts. This is corrective maintenance. Thus we can easily visualize several distinctive maintenance actions.

Maintenance consists of those activities as are required to keep an asset in "as built" condition so that it continues to possess its original characteristics. Maintenance results in the asset being available for intended use at minimum cost, functioning at or near agreed standards with minimum waste. Importance of maintenance operations have been recognized as one of the main tools for efficient functioning of hospitals.

Maintenance functions can be considered as follows:

Routine maintenance: This is a procedure followed regularly or as a cyclic operation recurring periodically. Defects that develop gradually will be discovered and eliminated.

Planned maintenance: This is a pre-planned maintenance action carried out with forethought and with knowledge of the equipment. Mostly it will be based on the recommendations of the equipment supplier. Periodical services like white-washing and painting of building, cleaning of water storage tanks, touching up of road sign-boards and the like come under this category. Planned maintenance involves administrative approval and support, adequate budget and a systematic procedure for implementation.

Preventive maintenance: This pertains to critical system maintenance to reduce the possible risk of failures to a minimum. Parts and sub-systems which are suspected to be unreliable are replaced before they actually fail, thus ensuring high reliability but at extra cost.

Breakdown maintenance: This is also called as repair maintenance and the basic concept is not to do anything until the equipment ceases to function. No servicing is carried out and the unit receives attention only after it has failed. The result is wastage of time, energy and money.

Predictive maintenance: Keeping the unit under surveillance and continuously monitoring its operation, the health of the unit is gauged. Based on how well the unit is performing, and maintenance is carried out.

Corrective maintenance: A time will come when age catches up with the unit which affects its performance. At this stage, maintenance is necessary to restore the capability of the unit to perform satisfactory. Sometimes manufacturers recommend a major overhaul after a stipulated working hours. This tantamounts to corrective maintenance.

Emergency maintenance: This refers to work done on an equipment or facility that involves personnel safety, extreme material or monetary loss or severe deterioration. This is an unexpected and unplanned workload requiring prompt notification of occurrence, rapid response and immediate action. Subsequent action should be diverted towards ascertaining the cause and taking effecitve steps to prevent a repetition.

2.5.2 Comparison of Activities

The following table includes a few maintenance actions under planned and preventive categories:

Illustrative Maintenance Actions		
Preventive maintenance	**Item**	**Planned maintenance**
Spot minor repairs, cleaning and touching up	Exterior walls	White wash, snowcem, print, paint, resurface
Cleaning of roof, drains, gutters, rain water pipes, and getting rid of bird nests	Roof	Water-proofing, inspection of vent pipes, openings, redoing parapet finishes, repair to gutters
Spot painting, white washing, touching up, minor repairs	Walls, floors, ceilings	White wash, colour wash, paint, resurface, replace damaged ceiling portion
Replace broken panes, repair so that they close properly	Doors, windows	Paint, repair or replace
Clean strainers, bottle traps, filters. Repair leaky taps. Adjust and balance water flows. Check expansion tanks and pressure vessels. Check storage does not overflow. Stop pipeline leaks and ensure fluid flows	Storage tanks and plumbing	Replace dirty or damaged pipes, clean floor drains and screens. Drain and clean storage tanks. Adjust and operate all major control valves. Paint steel tanks and stop tank leakages. Stop leakage from inlet and outlet valves. Check overflow pipe.

Preventive maintenance	Item	Planned maintenance
Replace defective lights, clean and inspect. Check wiring and connections	Lighting	Check all lights. Modify if necessary
Check inside temperature and humidity. Set all control devices properly. Check gauges	Heating and cooling	Clean inside units, clean filters, check controls, check complete unit operation
Spot repair, paint touch up, clean, align kerbs, minor repair to pathways and roads. Clear drains and repair. Clean grilles and replace broken or missing ones	Roads, Pathways Parking areas, covered and Open drains	Check all roadside signs for correctness and necessity, repair kerbs, resurface damaged portion, paint as required. Check all drains for sinking
Water, weed, manure, trim, check tree guards, paint make beds, clean and area, mow and lawn	Trees, flower beds, lawns hospital grounds	Plant trees, trim trees and hedges, redesign if necessary, fertilize. Clear grounds of all rotting matter rubbish, garbage etc.
Eradicate stuffy or foul smell, clean bottom of shaft and shaft walls	Shafts inside building	Inspect and stop leakage from soil, waste and water pipes. Replace broken pipes. Ensure proper anchorage

The maintenance activity of paramount importance is the one carried out before the onset of monsoon. This one action is a major contributor to the smooth functioning of the hospital during the long period of wetness. Function of the pre-monsoon maintenance is to ensure that all provisions incorporated in the hospital building and grounds function faultlessly and that the equipment assets of the hospital are sufficiently protected to withstand the ill effects of the wet and humid months. Some of the basic deeds are given in the cage below:

Pre-monsoon Maintenance	
Building	
Roof	Clean, clear, water-proof, attend to expansion joints
Shafts	Clean floor, check manhole cover, check vertical stacks condition (breakage, leakage) and anchorage.
Chajjas	Clean top portion, repair cracks
Windows and Doors	Check proper closing, replace broken or missing panes
Rain water down pipes	Clear, check anchorage, damage and leaks
Lightning protection	Check condition and electrical continuity, earthing
Roads, pathways	Clean specially both edges, check berms, check access road to emergency and other critical departments
Drains	Clean and clear, replace damaged or missing covers, check inside surface and correct sunken portions
Signboards	Check anchorage and looseness, easy noticeability and clarity, paint and illuminate if necessary
Garden	Remove tree branches too close to overhead lines, allow no soft ground patches, no pits or holes in the ground
Grounds	Clean and clear out all rubbish and degradable matter, permit no water-logging or pits and pot holes, ensure no obstruction exists to natural run off of rain water
Public Health	
Manholes	Check and clean, replace missing or broken covers, clear ground all around to prevent rain water ingress
Underground sumps	Clear ground all around and prevent rain water ingress into the sump (pollution), ensure all covers are in place
Water tanks	Ensure covers are in place
Treatment	Ensure sufficient stock of chemicals and chlorine gas
Pumps	All dewatering pumps to be checked for operation
Electrical	
Equipment	All external equipment to be protected as necessary and painting done where necessary
Earthing	All earthing to be checked for continuity and fitness
Lights	All external lights to be checked for fitness & functionability
Lifts	Inspect the lift room and bring it upto excellent condition
Mechanical	
Vehicles	Monsoon protection carried out as necessary. Garages and sheds to be checked for leaks

2.5.3 Design Out Maintenance

An ideal situation is one where maintenance is totally eliminated. Near to such a condition is one where maintenance is minimized to a low level. This is similar to maintenance by disposal or eliminative maintenance. Modular construction enables maintenance by replacement and disposal. In ball point pens refill is replaced unlike in ink pens where the ink is to be filled in. There are maintenance free or nearly maintenance free batteries. A few other examples are the use of disposable items like plates, razors and syringes. This concept however has to be applied at the design stage itself.

2.5.4 Contract Maintenance

This is a system where, for an agreed fee; a contractor supplies skilled manpower including supervisory staff, necessary spares and tools and even equipment required to carry out the maintenance tasks. Adopting this system will result in a reduction of permanent staff of the hospital and a consequential reduction in the salaries and other expenses. Several other advantages are also attributable to this system, the most important one being that the contractor can mobilize manpower quickly and in sufficient number to work round the clock in an emergency. This will reduce down time of the equipment or system.

This system could be beneficial in maintenance and upkeep of certain items like computers, telephones, TV, projectors, fire detectors, fire fighting equipment, photo copiers, vehicles, fencing, perimeter lighting, cleaning and replacement of luminaries and chokes etc.

A very careful and considered decision is essential in adopting contract maintenance, because the other party tends to gain more and more control over maintenance, ultimately gaining a position strong enough to dictate terms to the hospital. Also the regular maintenance staff of the hospital may feel that they have been relegated to a second place and develop an inferiority outlook. In contract maintenance, care should be taken to ensure that control and supervision are retained by the hospital authorities. In addition to this, the hospital should have some skeleton staff to take over the works in case the contract maintenance agency is unable to function due to any reason.

2.5.5 Requirements

Maintenance services require technical literature which covers the following:

- Equipment maintenance schedules and instructions
- Equipment operating manuals
- Trouble shooting and fault analysis charts
- Drawings
- Specifications

Provision of adequate and quality spare parts, appropriate and dependable tools, instruments and gauges is also an essential requirement.

2.5.6 Walk Around Inspection

The four senses inspection tour will prove to be most revealing. See the table below:

Three Senses Inspection Points		
Sight–Observe	**Sound–Hear**	**Sense–Feel or Touch**
Deterioration, corrosion, discolouration	Unusual noise	Hot–bearings, shafts
Leaks – air, fluid, lubricant	Hissing – gas, steam or air leak	Cold–no hot water or steam flow
Loose or missing parts	Grinding – lack of maintenance	Breeze – air leak from ducts
Loose or damaged belts	Silence – machinery not working	Vibration – machine out of balance
Loose or dangling wires	Dripping – fluid leaks, roof leaks	Shaking – loose foundation bolts
Electric sparks.	Banging – door or window not secured	Draught – open doors, broken window panes.
Tree branches touching electric wires	Humming – machinery not working properly	
Missing gauges		
Garbage and refuse collection	Slapping – frayed or torn	

Sight–Observe	Sound–Hear	Sense–Feel or Touch
Incorrect or unnecessary signboards Wet floor due to roof or pipeline leaks Absence of staff from their place of duty Neglecting safety–not using helmets, goggles, gloves, boots, belt and apron etc. Negligence, frivolity of staff or sleeping at the switch	Barking – dogs on the premises Chirping – birds' nests	
Identify the fourth sense and tabulate on the above lines how it can enrich the inspection activity (sixth sense excluded)		

Inspection rounds provide an opportunity to have a systematic and orderly look at the state of the assets and status of maintenance as well. Special attention should be paid for a few items as follows:

- Areas or items biologically dangerous to humans. Check if security measures are adequate and whether emergency procedures for accidental exposure exist and are known to all concerned.
- Equipment parts that are mechanically dangerous to humans. Moving parts like flywheels, belt and chain drives need guards.
- All fire detection alarm and fighting appliances. They should be functional and in place.
- Standby and emergency power equipment. Standard emergency procedures should be laid down and make known to all concerned.
- Misuse of hospital grounds and premises, breach of security. Damaged security walls and vacant security posts should be noted.

2.5.7 Maintenance Spares and Stores

Any maintenance set-up must have the backing of basic material supply. Provision of spare parts and stores is a service function to maintenance.

Spare parts, which are consumed regularly, could be called as maintenance spare parts. These spare parts are mostly required to replace worn out or damaged parts on the machine or fitting. These are generally fast moving and repetitive in nature.

It is common practice to procure fast moving spare parts at the time of purchasing the capital equipment. In a few cases, the value of spares procured as initial provisioning could touch 20% of the equipment value. The temptation is strong to purchase more than the requirement so that subsequent non-availability will not be a hindrance. Original manufacturers exploit this to dump non-moving expensive spares which gather dust on the hospital premises.

Stocking policies and consumption norms can easily be established based on actual withdrawals of spare parts. This exercise should take cognizance of ready availability of the items in the open market.

Spares can be categorised as follows:

Maintenance	Overhauling	Commissioning	Rotable	Insurance

Maintenance spares are fast moving ones and are stocked in plenty. Overhauling spares are needed during overhauling of the equipment to give it a new lease of life and need not be stocked. They could be procured just before the overhauling operation. Commissioning spares are required only at the time of installation, testing and commissioning of the equipment. Thereafter their utility does not exist and these are declared as project surplus to be disposed off. Rotable spares are full assemblies which replace the defective one and the

defective one is repaired and retained in store as ready stock. Insurance spares are vital parts of the equipment whose life expectancy is equal to the equipment itself. These are held virtually as standby for use in case of a breakdown.

2.5.8 Requirement Analysis

The VED-VEIN analysis is used to classify the intrinsic value of a spare and is briefly explained in the table below:

VED–VEIN Analysis	
VED	**VEIN**
• Vital: if not readily available, complete closure of the plant for long periods with on sequent loss would result. Ready example is a spark plug of a car • Essential: Stock out would result in moderate loss • Desirable: Non-availability will cause minor disruption and nuisance for short period!	• Vital • Essential • Important • Normal

Spares cost a lot of money and represents the capital that is locked up. Their inventory level should be kept at a minimum for which minimum working balance should be established based on past experience.

2.5.9 Procurement

The six factors governing procurement are as follows:

Right quantity	Right time	Right price	Right quality	Right source	Right place of delivery

It is very important to maintain a category-wise list of dependable and trustworthy suppliers as also details of the original suppliers of all the equipment.

2.5.10 Storage and Preservation

All spares and stores should have a secured area and separated category-wise. They should be stored in the best possible way duly protected against the ill effects of weather, dirt, dust and damage and even static electricity in case of electronic items. They should be correctly inventoried and documented. Protection against fire should be a prime concern.

In order that they retain their qualities, they should be guarded against dampness, excessive humidity, dryness, heat and cold, wide temperature variations and from direct sunlight, attack by insects and termites.

Special categories like metals, corrosive items, explosives and hazardous items, acids, chemicals, paints, gas cylinders, cement, timber, leather goods, rubber items, tubes and tyres etc. have to be stored with utmost care and preserved properly.

Generally all ferrous materials are given a protective coat of paint or varnish or are wrapped in greased paper. Precision items like instruments, electronic items and spares, ball and roller bearings etc. must be placed in clean polythene bags enclosing a moisture absorbing agent like silica gel. Preferably they should be in a dust free air-conditioned room protected against direct sunlight and moisture. Expensive instruments should be delicately preserved in their original packing boxes with small cotton bags of dehydrated silica gel. Fasteners and screws must have a hard preservative film and kept in shelves. Electrodes should remain in their original packing and kept in a dry room.

Battery cells have low shelf life in humid or damp conditions. Rubber goods have low shelf life and are affected by sunlight, moisture, air movement and heat. They must be covered with tarpauline. They should not be placed near heaters or under bright lights.

Glass sheets should be stacked in upright position and protected from rain. They will disintegrate if they absorb moisture.

Cloth and paper should be protected from moisture, rats, moths etc. by using insecticides.

2.6 WORKSHOP FACILITIES

A hospital abounds in equipment, fitments, furniture, machinery, instruments and gauges and a host of other things. In course of time, all these are bound to get damaged, broken, worn out and will need maintenance and upkeep. It is not always convenient to depend on the facilities existing in the open market because it could involve delay and transportation problem. Moreover, any unserviceable or unusable item will occupy space and deteriorate further in idleness. The best solution is the creation of minimum, but adequate, workshop facilities in the hospital premises itself. It could even attend to minor repair and maintenance of hospital vehicles like ambulances, mortuary van and hearse, staff cars and light load carrying vehicles, motorcycles and cycles.

2.6.1 Workshop Sections

The first step is to identify the nature of work that the workshop is likely to be called upon to do. Consider an adjustable hospital metal bed. It may need painting, replacement of a damaged bolt or bent linkage, repair of castor wheels, welding of a loose part. A hospital trolley may also need similar treatment. The hospital will have hundreds of fans of all types, electric motors of various sizes, heaters, refrigerators, water coolers and so on. Certainly they will need painting, motor rewinding or replacement of bearings. Wooden items will need carpentry work, painting and polishing, and may be upholstery repair. Caning of furniture may also be necessary. Vehicle maintenance and repair portion could be a convenient part of the workshop with necessary gadgets and tools. Cutlery may need plating. Thus we can broadly list the following possible sections in the workshop:

- Mechanical Section
- Air-conditioning and refrigeration section
- Sheet metal Section
- Blacksmithy Section
- Welding Section

- Glass blowing Section
- Electrical Section
- Electronic Section
- Instrumentation Section
- Electroplating Section
- Carpentry and cane weaving Section
- Painting Section.

If the hospital has an artificial limbs department, then some more sections will also be necessary.

Workshop is coverd in IS:10905 (Part 1)-1984 dealing with recommendations for basic requirements of General Hospital Building.

2.6.2 Trades

The trades involved are given below, but not all may be needed in every hospital:

- Fitter
- Electrician
- Machinist (Lathe operator)
- Electronic mechanic (Radio, TV etc.)
- Refrigeration mechanic
- Motor winder
- Air-conditioning mechanic
- Instrument mechanic
- Welder
- Electroplater
- Tinsmith
- Painter
- Blacksmith
- Spray painter
- Hammer man
- Signboard painter
- Carpenter
- Vehicle mechanic
- Cane weaver
- Vehicle electrician
- Upholsterer
- Mates, muzdoors
- Glass blower

2.6.3 Tradesmen Strength

This aspect is not easily amenable to standardisation and each hospital has to evaluate the requirements on a realistic basis taking into account which tradesmen are necessary or unnecessary because of availability of outside facilities of reliable status. Hospitals of long standing and those with teaching and training facilities are likely to have heavier maintenance problems and may need extra work hands. Repair work on contract basis with reputable outside agencies can prove to be economical, trouble free and beneficial.

A possible staffing pattern for a 750-bedded hospital could be as follows:

- Workshop supervisor/foreman 6
- Blacksmith 1
- Carpenter 1
- Glass blower 1
- Mechanic 1
- Painter 1
- Electrician 1
- Khalasis 1

If teaching and training facilities, hostels and residential accommodation are attached to the hospital, then the above staffing pattern will need to be suitably augmented.

2.6.4 Tools and Work Materials

The very purpose of having a workshop with adequate staff will be defeated if necessary tools and materials are not provided. Proper storage facilities should be made available and correct accounting procedures laid down. Sufficient number of safety gadgets like helmets, goggles, gloves, belts, dungarees, uniforms and clothing etc. should be readily available for use by workmen.

2.6.5 Workshop Management

The workshop should be run on professional lines following the rules and regulations in force and with regular checks and balances and frequent auditing. Cost accounting procedures should be laid down and detailed records maintained.

Check Your Progress 5

List the tradesmen who may be involved in repairs of fans.

.....

.....

2.7 ENGINEERING SERVICES DEPARTMENT

Hospitals used to be the domain of doctors and nurses long time back. Engineers had hardly any role to play in the functioning of the hospitals. With the advancements in the health care delivery mechanism and concurrent technological achievements, facilities like better buildings, electric and water supplies, centralized sewage disposal systems came into the picture. Steam and hot water supplies entered to make sterilization possible. This was followed by air-conditioning, comfort winter heating, laundry and kitchen mechanized equipment, incinerators and so on. Technological advancements in the field of electronics made its application to diagnostic, therapeutic, monitoring, and simple information and data bank possible in numerous ways. Thus health care facilities have become a home for engineering marvels which facilitate painless diagnosis and patients recovery and welfare to a very great extent.

You have already recognized the need for Workshop Facilities and learnt about its functions in the previous Section 2.6 of this unit. This facility is a fragment of the Engineering Services Department with which it is closely associated.

2.7.1 Types of Equipment

In the context of engineering services, the equipment in a hospital premises could be taken to consist of two types:

i) Bio-medical equipment in departments such as X-ray, CAT scan, Path lab, MRI, Linear Accelerator, Cardiac Catheterization and so on. Even monitors and ventilators, and a host of computerized adjuncts could be included in this category. In fact, all equipment and smaller items used in diagnostic and therapeutic fields of activity connected with health care delivery could be included in this group.

ii) Purely engineering services equipment involved in building maintenance, electricity and water supplies, air-conditioning and refrigeration, sewage disposal system, maintenance of roads and pathways and so on. We could even think of laundry and kitchen equipment, central manifold equipment and incinerator in this category with their base equipment distanced from the patients that they serve.

Thus, broadly speaking, we have two types of equipments – one closely associated with patients care, and the other supporting this primary equipment and providing amenities to every one inside and outside the hospital building. Bio-medical equipment are basically electricity operated and could also be considered as electro-medical equipment.

We can therefore consider the following two types of equipment and assets:

i) Building, roads and engineering plants and equipment

ii) Electro-medical or bio-medical equipment

2.7.2 Engineering Services Department

It is clear that hospital departments are varied in nature and must have the benefit of excellent accommodation, physical support services and properly functioning medical equipment. All these need constant attention and maintenance, and prompt repair and upkeep. To the extent possible, doctors and nurses should be relieved of the burden of actions associated with engineering services so that their full energies are devoted to their primary duty of patient care. Hospitals are labour intensive.

A hospital fails in delivery of health care if any department in it fails. This includes the engineering services department also in no less measure. In this way, the hospital engineering services department assumes a major responsibility and importance for efficient facilities management.

Information about Engineering Services Department is included in IS:10905 (Part 3)-1984 dealing with recommendations for basic requirements of General Hospital Buildings.

2.7.3 Functional Aspects

The growth of technology has increased the need for highly skilled, trained and experienced personnel to manage the intricate modern machinery and equipment. In advanced countries, a new specialist group of bio-medical equipment engineers and technicians look after the medical equipments which top class engineers who are not specifically trained can undertake.

A comprehensive services department may have the following functional areas:

- Maintenance and repair of bio-medical equipments
- Civil assets up-keep, maintenance and repair
- Electrical energy provisioning
- Water supply and sewerage systems management
- Management of air-conditioning and refrigeration services
- Responsibility towards fire protection system
- General safety and security systems
- Maintenance and repair of equipments, vehicles and instruments etc.
- Miscellaneous items as may exist in the hospital

Physical duties will broadly consist of the following:

- Maintenance of assets including periodical services
- Repair and renovation of equipment and systems

2.7.4 Engineering Specialities

This will consist of the following:

- Civil engineering – to deal with buildings including internal services, roads and pathways, grounds and horticulture and so on.

- Mechanical engineering – to deal with all mechanical equipments and vehicles, air-conditioning and refrigeration, medical and cooking gas supplies, steam plant and so on.
- Electrical engineering – to deal with all electrical equipment, sub-station and generating sets, UPS systems, area lighting and so on.
- Public health engineering – to deal with water supply, sewerage disposal, environment sustenance and so on.
- Electronics engineering – to deal with computers, communication equipment and systems, entertainment facilities like TV and music systems, and so on.

Almost all major medical equipment will involve several of the above specialities. For example, an MRI equipment needs electric supply and elaborate cooling arrangements which may need water supply, and has extensive electronic gadgetry.

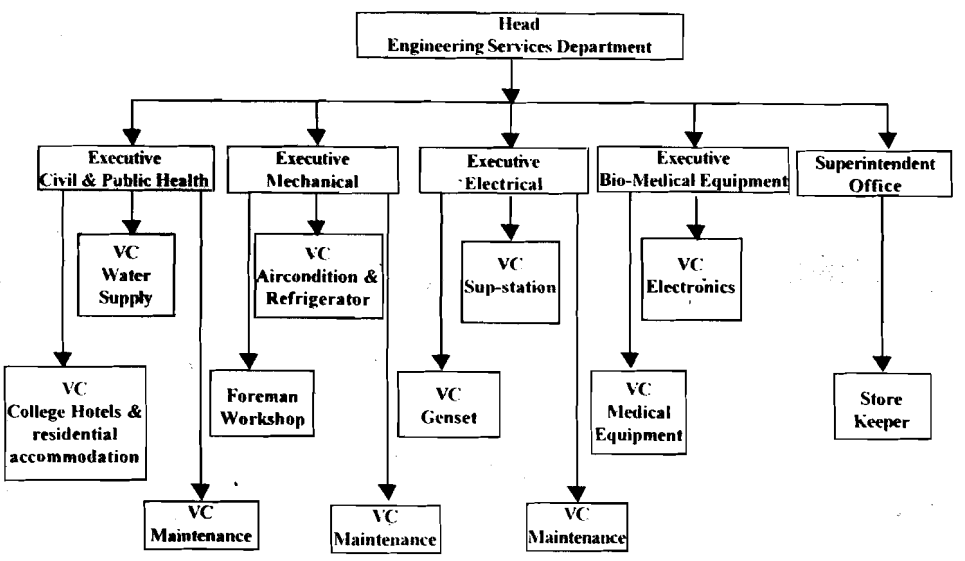
2.7.5 Structure of the Department

The importance of ready availability of skilled and trained staff to attend quickly to engineering tasks cannot be over-emphasised. Permanent engineering staff will become familiar with all the equipments and systems over a period of time, and will know the likely defects and the correct action to take in a crisis. They may even develop a sixth sense of impending failures based on past experiences.

No hard and fast rule can exist for the structure and size of the department due to numerous factors. The bed strength together with the speciality level of the hospital itself is a prime factor. Needs of a hospital with attached training and teaching facilities is another one. Availability of outside facilities nearby and readiness of dependable contractors of repute to undertake works on behalf of the hospital will influence this aspect substantially. Services of government agencies like the PWD, CPWD, Boards and Public Sector Undertakings could possibly be availed of and they have a huge manpower bank to rush to the assistance of a hospital in times of distress. Annual maintenance contracts are also entered into with external agencies in case of several items like lifts, specialist and costly medical equipment, computers and communication devices and others whose quantity is substantial.

A small hospital may have only a couple of mechanics, but not a department as such. Where the investment in buildings or equipment is considerable, creation of a department is a sound proposition. There will be scores of technicians working and even their supervision and control will be a big task. In case of super-speciality hospitals, creation of a department is always worth serious consideration even with low bed strength, because of the costly equipment and intricacy of support services. The prime function of the engineering services department is to provide a dependable base for rendering the best possible and economical engineering services of all kinds without shortcomings and failures.

Towards this aim, it is best to have a senior engineer with experience in all specialities of engineering heading the department. It could even be at chief engineer level and he should be responsible to the administrator or hospital apex body. Executives could work under the department head. A full-fledged, comprehensive and ideal set up for a hospital with training and teaching facilities and residential accommodation could be the following:



The structure should be viewed more from a practical need-based standpoint than in a cost effectiveness atmosphere. There should be close cooperation and coordination between the sections, and working in water-tight compartments should be discouraged. Medical equipment and electronics sections under Executive Bio-medical Equipment will be mostly working on the equipment in the places where they are installed and hence will carry out repair and maintenance also.

It would be prudent to associate the head of the engineering services in medical equipment purchase committees so that the services required for the forthcoming equipment can be appreciated and properly planned for execution.

2.7.6 Staffing Pattern

Hospitals consist of several multi-storeyed blocks with a vast array of internal compartments and passages. Travel time from one end to the other or from lower to higher floors is bound to be considerable.

Services like electric and water supplies, air-conditioning, sewage disposal, medical gas supply, lifts are to be kept functional on 24-hour basis and staffing should cater for three shift working. A person in-charge of electric sub-station has to remain there and cannot attend to the problems with the distribution network for which a separate person would be required. Such is the case with water supply and air-conditioning. Moreover, there could be more than one sub-station or plant room. Provision of staff for operation, and maintenance and repair will have to be made on different lines. Another important factor is the identification of essential services in an emergency in consultation with heads of the hospital departments and making adequate staff provision to meet this eventuality.

Because of these factors and several others, any staffing norm laid down could suffer from practical inadequacies and be misleading. Staffing pattern should be evaluated on case-to-case basis making due allowances for inevitable leave reserves. For preventive and planned maintenance activities, the staff needs should be closely related to the planned programmes so that each tradesman has an amount of work allotted which will keep the person steadily and effectively employed.

The most common category of staff would include pump attendants (for pumps operation), switchboard attendants (to look after distribution board and panels), linemen (to attend to overhead lines, if present), lift attendants (for operating the lifts), boiler attendants (for operating the boiler), AC plant operator (to operate AC plant and cold stores) and a horticulturist (to look after the grounds).

2.7.7 Control and Responsibilities

At any given time, there will be scores of technicians and tradesmen working on the hospital premises. For better control and effective supervision, the engineering services department should be the centre point for all activities. This should be the reporting and dispersal point for the staff. This will facilitate proper work allocation and issue of tools. It will help in effective supervision since the location of the workforce and nature of work will be known beforehand. Proper accounting and maintenance of records will be possible.

Effective daily management by the engineering services department is essential to achieve optimum utilisation of men, materials and money. Productive control and economical use o the tradesmen is possible if the following actions are taken:

- Prepare a work programme for maintenance tasks and minor works.
- Prioritize the above programme according to their importance (consult department heads).
- Evolve realistic time schedules for the different tasks based on local experience and factors.
- Maintain accurate job cost records for effective control and future reference.
- Prepare the works programme in sufficient detail to ensure even flow of work throughout the year to every tradesmen. The annual programme could be broken down into monthly and then weekly programmes.
- Maintain clear cut records for computing costs.
- Learn by experience — the best teacher. Avoid maintenance or repair as crisis management.

- Prepare a long term forecast of works such as foreseeable renovations and expansions, replacements and improvements, repair and the like.
- Carry out a monthly study of works carried out and expenses incurred on each work.

Role and responsibilities of the engineering services department should be clearly laid down. So also the responsibilities and duties of each and every person at all levels should be defined. Division of responsibility should be clearly established with no overlap or duplication between departments and the staff. A striking example is one where the maintenance of batteries in an emergency system became a point of dispute between the services department and the OT department staff. The dispute was amicably settled with a decision from the appropriate authority, but the batteries could not be saved as they were already damaged. Check lists and repair codes should be prepared and made available to the technicians. Safety measures and emergency procedures should be given prominence. All these should be displayed in such a fashion as to attract the attention of the staff and be available to them in any emergency. There should be a close interaction between the services staff and the heads of all departments of the hospital at all levels.

2.8 LET US SUM UP

This topic of Engineering and Allied Services presented would have made you aware of the diverse activities of the engineering services as are involved in modern and specialist hospitals and with which an administrator is bound to be closely associated. You have accordingly been kept in touch with all branches of engineering services in sufficient detail to enable you to grasp the issues as they come up and take a positively active part in discussions in a meaningful way. Certainly this information will stand you in good stead in planning and progressing of new proposals, renovations and augmentation of hospital facilities.

The invasion of electronics into the medical field has diversified the medico-technical equipment to a very great extent. The need for an electronics engineer is now firmly established to look after these equipment which are so very costly that their down time will prove disastrous to the patients and the hospital.

The importance of maintenance and a workshop in the hospital are established facts. So many trades and tradesmen are involved in the upkeep of the hospital and even then some contracting with outside agencies is inescapable to keep the number of staff within manageable limits.

The hospital will have to deal with several agencies to obtain water, electricity, fuel and gas supplies. Payment for these will have to be made as per prior agreements and these payments are high. You appreciate the dire need for energy conservation to reduce hospital expenses and bring health care delivery systems within reach of one and all. Affinity between energy conservation and maintenance has been highlighted by examples of a cycle and a household item to be identified by you.

Prominent technological advancements have been mentioned at appropriate places. Combined with this information and pointers in the unit, your own ability to gather supplementary information will assist you in moving up the learning curve and tackling any issue on end-to-end basis. Remember – No issue is settled until it is settled right.

UNIT 3 ENGINEERING HAZARDS

Structure

3.0 OBJECTIVES

After reading this unit, you should be able to:

- know the various aspects of hospital planning and problems associated;
- identify the physical environment for healing and their metriculours provisioning to avoid hazardous conditions;
- get acquainted with the various building elements and materials which are used in hospital;
- identify the problematic areas leading to engineering hazards or even health hazards;
- know the general standards of planning and design with particular attention to details and finishes; and
- take effective steps and safety measures in case of contamination.

3.1 INTRODUCTION

Modern hospitals rely heavily upon engineering services for their efficient functioning. Any dislocation of these services, even for a short period, leads to hazardous situations and even loss of life. The problem, in fact, is accentuated by the large number of potential hazards

arising out of engineering services which have to be used in a hospital and diverse background of its inhabitants, patients, visitors and staff.

In this unit, you will learn about the problems associated with hospital planning and design, physical environment, materials and building elements, and hospital installations which may lead to Engineering Hazards if proper care is not exercised.

You may be aware that planning of hospital engineering and utility services is a vital aspect in the design of hospitals, because on this aspect alone, depends their functional efficiency. At any time without warning, any of the services can become critical in a hospital. The planning of engineering services has to be based on "zero failure" concept.

Engineering hazards are mainly due to faulty planning, unsoundness of structure to withstand natural calamities like cyclones, floods, earthquakes, high winds and man-made disasters like blast etc. Failure caused on account of absence of proper coordination in laying of services, installations, feeders, their up-keep and proper maintenance of engineering services like electric supply, water supply, ventilation system, communication, fire protection, traction, medicinal gas supply, artificial environment, noise control, glaring effect results in engineering hazards.

You will appreciate that in order to reduce the chances of engineering facilities failure, it is essential for each and every hospital to look into the various causes of engineering hazards to arrive at the correct solution to prevent its occurrence. Suitable corrective, preventive and breakdown maintenance programme are essential to ensure safety and smooth functioning of hospital. Special attention to prevent slip and fall by patients, employees and visitors is essential.

3.2 HOSPITAL PLANNING AND DESIGN

Hospital in a way is a House Of Sick People seeking Investigation, Treatment either Ambulatory or Lying in bed.

Responsibilities of the hospital to patients, to staff and to the community for general safety, soundness of design and emergency programmes are shared by clinical services and engineering services including general administration and hospital installations. While planning a hospital all aspects of general safety must be taken into consideration to avoid uncontrollable situations. However, it requires constant thought and vigilance by all if the hospital is to be prepared to serve its proper role in the circumstances which may vary from simple hazard to catastrophic situations. It is at this stage of hospital planning and design that close co-operation and coordination among the architects, engineers and hospital administrator is extremely desired.

The design, construction, renovation, expansion, equipment, and operation of hospitals and medical facilities are all subject to provisions of several environmental pollution control regulations set by Central Board for prevention and control of pollution, in National Building Codes, Indian Standards and Local Municipal Bye-Laws. Many states and municipal bodies enacted stringent regulations for air quality related to incinerators and gas sterilizers, underground storage tanks, hazardous materials, waste storage, handling and disposal, storm water control, medical waste storage and disposal, and asbestos in building materials.

3.2.1 Hospital Layout

The best possible layout for a hospital building would be a group of isolated buildings dispersed over a wide area. In the event of one of the buildings getting damaged from a disaster like blast or fire, the other buildings survive and hospital remains operational. Such layout has proved costly to construct and maintain and also lacks functional efficiency.

Paucity of land particularly in the urban areas primarily necessitated multi-storeyed construction for hospitals. A single high rise building, however is not a welcome proposition for a hospital in the context of accumulated risk from disasters, making the services fully non-functional. Such high rise building is also subject to other natural calamities like cyclone and earthquake.

The most satisfactory approach from the point of view of maximum safety against man-made or natural disasters for a hospital at present will be a group of structurally isolated multi-storeyed buildings. The isolation is achieved by a number of separation joints, stairs and passages

3.2.2 Design Soundness

The design of a hospital building should be such that:

- It shall be serviceable under normal loading, including fire and floods,
- The building should survive minor emergency loading on account of designed high wind, earthquake and blast without any sign of distress, and
- The building should survive extremely severe emergency loading of a near miss blast, hurricane or major earthquake with visible damage without collapse.

3.2.3 Hospital Safety

The various aspects that are to be looked into by a structural engineer in design of structure (hospital building) keeping in view the functional utility of the hospital as paramount in the event of a disaster are:

- Fire
- Deluge and flood
- High wind and earthquake
- Blast

It is necessary to look into the safety requirements of each of them to arrive at the correct solution to prevent or overcome them:

Fire

A hospital being a public building with multifaced utility is particularly susceptible to fire. The aim in design shall be early detection of fire primarily for life safety and thereafter containment of fire. Provision of emergency exit is one of the prime requirements for a multi-storeyed hospital building. The escape routes should be fire protected and smoke free by means of horizontal and vertical passageway and ramps for physically handicapped. A hospital building coming under Group C-1 (Industrial) for fire safety as per National Building Codes should have a fire rating of 2-4 hours (maximum), depending on the actual occupancy. The role of structural engineer is therefore:

- To select and design structural members of sufficiently high rating, so that they do not collapse within the specified times.
- Judicious use of fire walls to compartmentalise the building to limit spread of fire. Fire protection of emergency exit passageway by walls of suitable rating and housing of fire escape stairways in the smoke proof tower.

We will learn more details about hospital fire safety plan in Unit 4, Block 3 of Course 5.

Flood

Flood can be a routine annual phenomenon in reverine areas or a flash flood due to a sudden cloud burst. In either case, functioning of hospital should not get affected. The hospital building shall be sited above the highest flood level with raised plinth for eventual safety from getting submerged. A hump at the direct entrance to the basement will be necessary to prevent ingress of floodwater. The basement should be made fully waterproof through proper treatment.

Non functioning of sewage and storm water disposal system can be another difficulty consequent to flooding of sewer manholes and storm water chambers. This can jeopardize the normal functioning of a hospital. Solution can be the use of high discharge pumping coupled with a high-level captive disposal system.

High Wind and Earthquake

All multi-storeyed buildings are required to be designed to withstand the effect of strong gale and seismic forces as applicable.

High wind damage to buildings is caused by severe straight wind. The high wind strikes a building in gusts imposing dynamic loading. The design wind load for a building is a function of many factors like terrain, building shape, height to width ratio, building use, etc.

Building use governs the frequency of maximum wind force called " mean recurrence interval" which is a key factor in calculating the total wind force. National Building Codes, and the Indian Standards, recommended a higher "mean recurrence interval" for a hospital building on account of its importance to society. IS: 875 (Part-3)-1988 for wind loading recommends a "mean recurrence interval" of 100 years for a hospital building compared to 50 years for a normal building.

The Indian Standards also recommend the use of equivalent static method to arrive at the wind force upto a height of 40 metres and adoption of height to width ratio less than 5 to reduce dynamic effect.

Earthquake

Earthquake-induced ground movement subjects a building to a three dimensional dynamic force. The quantum of horizontal seismic force at each level is a function of mass, height and the coefficient of seismicity. The importance of a hospital building has been considered by the Indian Standards for earthquake loading in IS: 1893-1964 by introducing an important factor for assessment of coefficient of seismicity ('alfa').

The effect of earthquake also produces oscillations of the structure and consequent reversal of stresses in the structural components. The Indian Standards recommend a length to width ratio not exceeding three.

Blast

The effect of blast on a building or structure is for a very short duration over-pressures followed by negative pressure. The magnitude of the over-pressure depends on the intensity of the blast and the distance of the epicenter from the building. Instantaneous rise of pressure followed by negative pressure subjects the building to a dynamic force which may be many times greater than those experienced under the severest of hurricanes.

3.3 PHYSICAL ENVIRONMENT

Many man-made environments are seldom wholly satisfactory for human beings.

Frequently the human body is placed in thermal neutrality and uniform illumination is provided. The widely spread concept of so called optimum conditions for physical environment, meaning that fixed sets of environmental conditions for so called perfect comfort are implied, is definitely suspect. Often a minor change within the comfort range of temperature, humidity, air movement, illumination and sounds checks the feeling of monotony and thus acts in a beneficial manner. As today's patient is more knowledgeable about medicine and more conscious of his surroundings than his counterpart in the past, the quality of hospital built environment, particularly in the patient areas, require careful attention.

A physical environment must satisfy three conditions:

- It should do no harm. It should be safe in configuration and material usage, in providing adequate temperate, clean air, adequate safe sound and light levels.
- It should facilitate medical service. It should provide efficient layouts for staff, support family participation, provide effective colours, light and sound levels for the task being done.
- It should contribute to healing. It should balance adequate stimulation with over stimulation, induce positive physiological responses, and enhance patient control and participation in the environment.

The principal aspects of architectural design, building form and detail, are also important factors in the physical environment. The building form must evoke positives, reassuring responses both from recall of reassuring forms but also from aesthetic pleasure. There is ample evidence that exposure to nature through interaction or access to views and landscape has a positive healing effect.

Some of the key environmental issues essential to a physical environment for healing are light, colour, sound, climate, and ventilation.

3.3.1 Light

Not only vision requires light. Light is an environmental factor as much as air, water and temperature. Day light has perhaps several hundred important effects on human bodily functions. Many of them have a 24-hour rhythm following the daily cycle of light and darkness. A nice view through window is preferred when the choice is between having sunshine into the interiors and an unpleasant view through the window and no sunshine indoors. For an in-patient who is away from his familiar environments, the visual comfort in supporting his self-confidence is a factor of paramount importance.

For the majority of ordinary occupations, the desired lighting intensity, based on visual acuity tests is about one hundredth of the normal out of door midday lighting intensity. 700 Lux of balanced light will be just as good for visual clarity as 1000 Lux of cool white light. The general room lighting level should not exceed 750 Lux. A higher level is considered to be a stress factor.

In order to avoid occurrence of hazardous conditions, design strategies for a healing lighting environment should accomplish the following:

- Provides artificial light from sources that have high colour rendering indices and are in the 3500° K temperatures range.
- Provides general illumination from indirect sources, at reasonable intensity for most uses.
- Provides intensity variability in general illumination so that spaces may be adjusted for active outward activities (high levels illumination) or for more passive inwardly focussed activity (lower levels of illumination)
- Add sparkle point and focal glow for variety and object rendering.
- Relate general illumination temporal patterns closely to diurnal pattern.
- Ensure access to unfiltered day light for long term patients. (access to outdoor)
- Provides for patient control of light within their territorial spaces.
- Provide nonglare visual access to outside wherever possible from spaces occupied continuously for any significant length of time.

3.3.2 Colour

Colour is a sensation, which creates an instant impact. Colour is an essential element of visual stimulation in environment. A human eye does not respond equally to all colours. The response is more to green, yellow and orange than to red or blue. The individual variations are considerable. Colour can delight and soothe, provoke and disturb. A very personal sensitivity to colour is active from the moment of birth.

Reds, dark browns, deep purple and black should be avoided in hospitals altogether. The colour red in paint and drapes of a patient's room is said to retard rather than speed up the getting well.

The choice of colour should make it easier for the cleaners to discover dirt and substances capable of transmitting infections. Frequently white is used in a hospital widely as this colour carries the message of cleanliness. However, ophthalmologists have warned about interiors with large areas of bright white which may cause an effect similar to snow blindness

To make the environment free of hazardous conditions, design strategies for a healing colour environment must include:

- Variety of accent within an acceptable field colour framework;
- Balance between under stimulation of extreme unity and over stimulation of extreme complexity;
- Selection of warm or cool colour related to appropriate activity level intended for space;
- Use of colour contrast techniques to reinforce figure ground definition in environments for the elderly; and
- Use of cueing and coding to aid way finding and understanding.

3.3.3 Sound

Sound generated by the environment with no specific human purpose is also a noise, which can be positive, for example sounds from nature, such as birds or breezes, and negative, as it often is with man-made sounds such as machine or intrusive activity noise. Noise is meaningless sound. As the world becomes noisier, it becomes less meaningful. Specific noises may evoke fears. However, many reactions are highly individual.

Most likely the hospital staff is in great need of noise control information; much noise arises from lack of consideration of the patient's comfort. Many of the annoying sounds in the patient areas could be eliminated if the employees and visitors would observe the rules of common courtesy, i.e., walking and talking more quietly.

When the noise is measured in the dB, is increased from 0 to 20 dB, the true increase of noise is 10 times, to 40dB it is 100 times, to 60 dB it is 1000 times, to 80 dB it is 10,000 times and 100

dB it is 1,00,000 times. An average noise level of values 30 to 40 dB in hospital is acceptable.

Health facility design strategy should set goals for acceptable noise levels to avoid hazardous conditions and achieve them through:

- Source attenuation (location isolation, insulations, bumples)
- Source elimination (phone bells, intercoms, audio pagers, printers)
- General acoustic attenuation (adequate ceilings, walls, doors)
- Patient control (television, fans, doors)

Selective use of music with adequate concern for patient control, can also contribute positively.

3.3.4 Climate

Temperature, humidity and air changes are all key issues which are equally as important as light, colour and sound in physical environment. These issues are influenced by need for energy efficiency. The comfort and purity of the air provided are both critical to the healing process, as is also perceived control over the patient's territory by the patient. A balance in air change rates and energy consumption must be struck which heightens the importance of exhaust heat recovery.

Temperature

The body temperature-regulating center is located in the hypothalamus. Body temperature adjustments are made either by a fine regulating mechanism such as skin, blood flow or by coarse mechanisms such as shivering and sweating.

A generally preferred indoor temperature for healthy adults seems to be in the region of 21°C to 23°C. When the mean night temperature rises above 24°C, the percentage of those whose sleep is disturbed increases.

Humidity

The acceptable limits for relative humidity as regard static electricity and comfort are 45-60 percent. For new-born and premature infants, a 55-65 percent relative humidity has been considered to be desirable. Humidity in the operation room is believed to contribute to the prevention of dehydration of exposed tissues.

3.3.5 Ventilation

It is important that staff are able to control the natural ventilation easily. In clinical rooms with sealed windows appropriate speedy ventilation may be difficult to achieve, even with mechanical installations.

Ventilation installations has seldom met specifications. Air-conditioning equipment has been poorly maintained because there has been gross ignorance about its function and purpose. Air-conditioning is considered to be a health hazard in its present forms. Rapid cooling and direct draughts must be avoided.

Health Hazards

One factor contributing to the high frequency of nosocomial infections in modern hospitals may be transmission of infection via the ventilation system. Micro-organisms can be drawn into the building from outside and pathogens from within the building are taken up by the re-circulating air.

Lack of pre-commissioning cleaning can be contributing factor.

The damp conditions inside the humidifiers are particularly suitable for microbial growth. Humidifiers can provide a steady source of infected air to be circulated around the hospital. Humidifier fever is a recognized disease which possibly results, as its name suggests in high fever. Exposure to the slime that builds up in poorly maintained humidifier baffle plates has produced symptoms of illness among the sensitive individuals.

Specialized Cleaning

The engineers who design and install ventilation systems rarely appreciate the need to clean

them. As a consequence little provision is made for cleaning to be carried out. It is often necessary to employ a specialist contractor to do the cleaning.

The professional hygiene contractor provides fully trained staff with necessary equipment to carryout and maintain an effective hygiene maintenance programme for all water and ventilation system.

4) Indoor temperature for healthy adult is preferred to be in the region of ..... to ..... for comfort conditions.

5) Damp conditions inside the humidifiers can provide a ..... of infected air to be circulated around the hospital, it contributes to health hazards.

3.4 BUILDING ELEMENTS AND MATERIALS

Materials can also contribute positively to healing through stimulating and engaging the tactile senses. Selection of material is critical in a number of ways. First it is essential to select non-toxic, non-allergenic and non-bacterial harbouring materials for patient safety. Second, materials need to be selected and designed for safe use. This is particularly true for floors and stair.

Type and nature of walls, ceilings and shielding are the design issues, which have positive effect in judicious choice of building elements. Necessities of right size of doors and windows opening have significant role to play in contributing functional efficiencies of hospital building. Underestimating the utility values of these building elements will be adding to engineering hazards.

3.4.1 Slip Hazards—Floors

Over half of the slip and fall happen on flat surfaces that is floors. The problem of reducing the slip hazards is compounded by the variable in selection process.

No safety programme is complete without training and awareness for both employees and the public. Cleaning and maintenance duties are carried out by a diverse group of people with varying degrees of education. This highlights need for easy to use multi-lingual instructions that stress pictograms and icons wherever possible, robust formulations that are tolerant of misuse, and equipment to reduce errors whatever possible.

Flooring materials shall be easily cleanable and appropriately wear resistant for the location. Floors in areas used for food preparation or food assembly shall be water-resistant. Floor surfaces, including tile joints, shall be resistant to food acids. In all areas subject to frequent wet cleaning methods, floor materials shall not be physically effected by germicidal cleaning solutions. Floor subject to traffic while wet shall have a non-slip surface.

Flooring material in laboratories should be tested with strong acids, alkalies, water, solvents and stains. The floors should be of non-slip quality also when wet, easy to clean, hard wearing and fire resistant. In radiology units loads of 2000 kg./sq.m are installed, a fact to be observed when designing the radio diagnostic department flooring. By using flooring with readily removable tiles the laying or removing of low tension and high tension cables is simplified and an easier change over of equipment is achieved.

Flooring material in the operation rooms as well as anaesthetic and equivalent rooms, high demands are made. The floors should be non slippery, when wet, withstand intensive application of water and disinfectants, not absorb physically foreign molecules, have a high resistance to breakdown, be elastic and recover after the removal of heavy objects, be fire resistant, be colour fast, and not require treatment with wax or other preservatives. Coved

skirting with a minimum radius of 3 cm and minimum height of 10 cm should be used for all floors, thereby eliminating junction between skirting and flooring. Skirting shall be kept flush to wall surfaces.

Precaution against explosions must be maintained in the operation room and where flammable anaesthetics are stored. Requirement for conductive flooring may be omitted if no flammable anaesthetic agents will be used. The conductive floor finishes have to conform with the standards and requirements of national agencies.

The use of electrical and electronic equipment in direct contact with the patient and the introduction of electrodes into body cavities, particularly in the close proximity to or into the heart has increased electrical hazards.

Conductive floors in rooms where electronic equipment is used on patients are needed. No appreciable charge should be allowed to build up on the floor, which should have a resistance to limit the current from any defective equipment and simultaneously dissipate the energy through its conductivity.

In floor colours brown tending towards red and other brown tinges may give a feeling of safety and peacefulness. A dark green tinges may lead to association of moss or a soft lawn. Light and vague colours should not be used. They may be associated with slipping and falling and produce a feeling of insecurity.

3.4.2 Ramps, Steps and Stairs

If ramps are to be used by the ambulant disabled as the main means of entry, a minimum gradient of slope is best. The gradation of which may not be greater than 1:10. Pedestrian ramps must have handrails. A landing every 9 m is ideal.

Minimum width of the slanting level as 1.6 m could be accepted. All starting levels should be slip free and fitted with handrails, at a height of about 90 cm and another at the height of 50 cm for ease of patients and visitors in wheel chairs.

Many of the ambulant disabled find stairs easier to negotiate than ramps. Stairs in health care facilities should have not more than 15 cm as riser and not less than 30 cm as tread. Handrails should be positioned on both sides of steps.

Steps, stairs and handrails should not be made of slippery material. Hard, level, non-skid surfaces are essential. The nosing should be non-protruding so that people with stiff joints, braces, artificial legs or other leg or stability problems will not catch their toes as they climb.

3.4.3 Walls and Ceilings

Walls

Traditionally it has been regarded reasonable to propose that wall materials in the high hygienic standard areas like operation rooms should be hard, robust, impervious, jointless, non absorbent, easily cleaned and decontaminated. The wall finishes should be unaffected by colour change, staining and mildew. These requirements in perfection are held too high, as the hygienic hazards of the walls are extremely small.

Ceilings

The requirement of operation room ceiling has to meet a clean room application. Clean room is defined by class. A class 10 clean room will contain less than 10 particles per cubic foot (a particle is counted if it is larger than 0.5 micron). A micron is very small, putting this in perspective it is one thousandth of a millimetre.

The minimum ceiling height shall be 2.4 m with following exceptions:

- Boiler rooms shall have ceiling clearances not less than 76 cm above the main boiler header and connecting piping.
- Ceilings in radiography room, operating and delivery rooms, and other rooms containing ceiling mounted equipment or ceiling mounted surgical light fixtures shall be of sufficient height to accommodate the equipment or fixtures and their normal movement.
- Ceilings in corridors, storage rooms and toilets shall be not less than 2.35 m in height.

- Suspended tracks, rails and pipes located in the traffic path for patients in beds and or on stretchers including those in in-patient service areas, shall be not less than 2.15 m above the floor.
- Seclusion treatment rooms shall have a minimum ceiling height of 2.75 m.

3.4.4 Elevators

Elevators are needed for moving beds, stretcher beds and other wheeled carrier. No single elevator should be provided, they should be arranged in groups of two or three. Hospital type elevator cars shall have inside dimensions that accommodate a patient bed with attendants. Cars shall be at least 150 cm wide by 230 cm deep. Car doors shall have a clear opening not less than 120 cm wide 215 cm high. Additional elevators installed for visitors and material handling may be smaller within restrictions set by standards for handicapped access.

Elevators shall be equipped with a two way automatic level maintaining device with an accuracy. Each elevator except those for material handling, shall be equipped with a two way special service switch for staff use, for by-passing all landing button calls and travelling directly to any floor. Elevator call buttons shall not be activated by heat or smoke. If employed, light beam door activators shall be used in combination with door edge safety devices and shall be connected to a system of smoke detectors. This is so that the light control features will disengage or be over ridden if it encounters smoke at any landing.

The control system for a group of staff and visitors, elevators should be based on normal controls with call accumulating devices to shorten waiting times. Car start time should be less than one second.

Elevator doors protected with a rubber safety edge should strike with a minimum impact and should promptly reopen. Doors equipped with a light ray of electronic detector system should reverse before they strike a person or bed in their path. Door reversal should be gentle.

3.4.5 Shielding

Electronic measurement of a patient's heart, brain and other potentials generated by the body involves extremely weak electrical signals. As the recordings on the instruments are obtained by a high degree of amplification of these signals, the physiological recording may be seriously distorted or degraded by interference in the surrounding area.

Electromagnetic interference should be eliminated from rooms in which encephalographic (EEG), electromyography (EMG), or other equally sensitive equipment, but not electrocardiograph (ECG) is used or where the output of this kind of equipment is fed into a computer for comparison or analysis.

Among such rooms the following can be mentioned:

- Intensive care and monitoring rooms
- Operation theatres
- Rooms for catheterisation
- Rooms for angiographic techniques
- All rooms for measurement of bio-electric potentials

The shielding of a radiation room shall protect occupationally exposed persons as well as non-radiation workers. It must not be impaired by joints, openings for pipes, duct etc. passing through the barriers, or by conduits, service boxes etc. embedded in the barriers.

Permanent wall radiation screening in X-ray department rooms where the working capacity does not extend 150 KV and radiation is undirected, should comprise of a 2 mm thick sheet of lead or equivalent material such as 160 mm concrete or upto 250 mm brick masonry. In the X-ray department shielded floors will be necessary if there are rooms below the X-ray rooms, particularly if tubes pointing downwards are used. When examinations are made with the under coach tubes, shielding of ceiling will be necessary for rooms above. Concrete is considered to be the most effective shielding material.

Doors and other means of access to the X-ray room and observation windows also require special consideration to ensure adequate protection without sacrificing operational efficiency. The lead lining must also be sandwiched into the doors leading to the room.

For viewing openings between the operator and patient, at least 10 mm thick shielded glass containing barium or lead should be used. Similar requirements have been adapted on computer assisted tomography units.

In operation rooms where X-ray equipment may have the same capacity as that in x-ray department itself, it is essential to apply the x-ray department standards. The radiation protection relates also to the walls of the rooms in the emergency and in the intensive care unit where x-ray equipment is used frequently.

In nuclear medicine laboratories safety precautions are much more important in in-vivo than in-vitro studies. Shielding is required not only of the nuclides themselves but of the surrounding room, so that the floors, walls and ceiling adequately reduce radiation exposure.

3.4.6 Openings—Doors and Windows

Doors

Doorways should have 86 cm clear opening width to allow easy passage area for a wheel chair. In the operation department, staff dressed in sterilized garments needs a minimum door opening width of 90 cm. For operation room, a clearance of about 10 cm on either side of the hospital bed including special equipment is required to move it through an opening, a width of 150 cm for (two leaf) door openings can be recommended. If self closing operation room doors are used they should preferably be surface sliding, power operated and controlled by photoelectric cells. In the post operative recovery area the doorways should pass beds easily, a door width of about 145 cm is recommended. Any opening device adapted to the surgical department, doors must allow them to be operated manually or swung open in case the device fails. A device that holds the door open must be provided to simplify equipment moving.

In the ICU's handles can be omitted from doors, which can be pushed open. Also here the door width should be about 145 cm. In neonatal intensive care units, the door widths of 90 cm can be accepted.

X-ray room doors can generally be shielded by sheet lead, possibly in the form of a wood-lead-wood sandwich. Shielded doors may need an automatic closure to ensure that they are normally shut. Doors to fluoroscopic examination rooms should have no light leaks into the examination room. In laboratories, 120 cm is considered to be the minimum acceptable door width. For easy exit, doors should swing out from the laboratory. Secondary escape exits should be provided.

Emergency exits must be clearly labeled. Exit signs may be designed to flash when the emergency alarm is on. However flashing red lights can cause headaches, nausea and in extreme cases, epileptic seizures. Distance from farthest point from a room to the nearest exit should be less than 60 m, from a patient room less than 45 m. In Sweden this distance in the nursing units is reduced to 30 m.

There are fire codes and regulations that require that the doors on patient floors be kept closed or be self-closing to prevent smoke spread. Many patients feel isolated behind closed doors and many nurses feel that they must be able to see their patients from the corridor. As a compromise, the doors should be permitted to remain open, if so desired, but there should be provision for automatic or remote release and closing upon detection of smoke.

Windows

The ability to look out the window is extremely significant to the inpatient. Attention to the outer world is essential to relieve the sense of enclosure and to provide muscular relief to the eye by allowing it to focus at a distance. Window size is a compromise between the need to afford a satisfying view and the need to conserve energy and afford privacy. Satisfaction is generally achieved when the window area occupies 20 to 30 percent of the window wall.

3.5 HOSPITAL INSTALLATIONS

Hospital is one building type where maximum and varied number of services are required and that too, in any part of the building. It has been found that cost of these services viz. electrical, water supply, sanitary, communication, emergency power, medicinal gases etc. amount to almost over 30% of the total cost.

The working of almost all the hospital services and medico equipment are directly or indirectly depends upon a reliable continuous and stabilized supply system through network of hospital installations.

3.5.1 Electric Supply

Electricity could rather be called the life line of hospital working. Here we shall consider and discuss in brief the systems in the context of hazards, arrangements for providing reliable and continuous essential power requirements in a hospital and also some major causes of breakdowns in supply systems and ways to minimising them under following heads:

1) **Arrangements for Continuous Supply Systems**

The problems of perennial energy shortage, erratic power supply and to meet the requirements for the essential services like general lighting, water supply, lifts and life saving equipments in a hospital have to be overcome by installation of following standby systems.

i) Generating Set

ii) Portable Emergency Lights

iii) Un-interrupted power supply system

iv) Voltage stabilizers

v) Duplicate feeders

2) **Main Causes of Failures for Electrical Supply and Ways to Minimize Them**

i) **Cables:** Cables are not immune to faults; electric stresses, voltage fluctuations and surges, moisture penetrating through sheath and reaching core of cables cause insulation resistance to drop to a point where deterioration of cable insulation starts. Mechanical damages like abrasion, crimping, embattlement, cracking and shrinking caused by insulation aging also add to cable failures. Mechanical or physical pressures on cables can deform insulation and may reduce its ability to withstand voltage pressures.

Carelessness during laying of cables namely, not properly bent, pulled, squeezed or dragged, cable can be seriously damaged. Short circuit produces thermal as well as electro-magnetic stresses. Properly selected and laid cables have high reliability over voltage surges and overheating of joints and terminals. If a cable is not of appropriate size and it is overloaded, overheating of joints and terminals occur, thereby causing loss of continuity in either conductors or cable sheath.

External factors like ambient temperature, free moisture, soil acidity, insects plants, fungus also contribute to cause of cable failure.

However, sizeable portion of faults is attributed to bad workman ship, use of improper jointing material and incorrect process of jointing. These could be minimized by following the manual instructions and entrusting the jointing work to trained and skilled persons only.

ii) **Oil/Air circuit breakers:** Circuit breakers being static apparatus are usually not given the same care and attention as the rotating machinery. Proper and smooth working of mechanism of circuit breaker is equally important. Skilled and trained staff should attend periodical cleaning and adjustment of mechanism. Proper functioning of mechanism of circuit breakers is tested by means of automatic releases. The other controls and accessories like overhead trip coils, under voltage release, adjustable time lags, earth leakage relay etc., should be properly and regularly checked and their proper functioning ensured.

iii) **Electric Motors:** Electric motors form bulk of drive system of machinery and equipment. For smooth and reliability of drive systems the proper care and attention to electric motors is extremely essential. The abnormal working and mal-functioning of an electric motor can be due to Mechanical and Electrical failure.

The Mechanical failure can be predicted in advance to a great extent, such as vibrations caused by mal-functioning of various components. These faults should be checked properly and greasing done at regular intervals.

The Electrical failure cannot be easily predicted and in spite of good preventive maintenance schedule, electrical faults may take place without pre-warning. Mainly thermal stresses, electric stresses or even environmental conditions can cause these. Overloading of motor and voltage surges contribute heavily towards deterioration of winding insulation.

iv) **Electrical equipment:** Electrical equipment when put to use are subjected to stress and strains. It is therefore, necessary to minimize the nuisance of these factors by periodic and proper maintenance. Under wear and tear, avoidable damages to electrical installations and equipment can also be minimized by taking proper and timely care as follows:

- Electrical equipment must not be connected to the outlet points with loose leads or bare ends of wires.
- On one outlet point only one equipment should be installed.
- The capacities on the outlet points and connecting wires must be matching to take the specified load of equipment to be connected.
- Heating appliances, light and fans must be switched off when any room is to be locked or left unattended.
- All the electrical appliances, equipment must be properly earthed.

3) **General Maintenance**

Regular up-keep and proper maintenance of electrical installations, equipment and machineries is of utmost important. The maintenance of sterile areas like the operation rooms, intensive care unit, anaesthesia rooms and critical areas in a hospital need special attention and care. Slight carelessness can add to complications and infection problems. Delicate and sensitive equipment which require better and safe controlling devices, miniature-circuit breakers (MCBs) shall be provided.

Another aspect of the sterile areas is the quality of supply air from air-conditioning system where HEPA filters are used. These have an efficiency as high as 99.9% for particles up to 5 microns or less in size. Due to extremely fine filtration media they need proper maintenance and frequent replacements of MCBs and HEPA filters.

The maintenance activities must also lead to better and efficient performance. To minimize down timings, continuous and timely maintenance as follows is essential and unavoidable:

- Corrective maintenance: Helps in improving the equipment.
- Preventive maintenance: Up-keeps the equipment maintenance
- Breakdown maintenance: Keeps running or pushes the equipment.

3.5.2 Water Supply

Water is in inescapable necessity of hospital functioning. Here we shall be considering the problems and remedial measures of water supply systems in order to avoid hazardous conditions. Beside normal water supply system, hospitals also require a two-temperature range for hot water. Low temperature about 40°C is required for patient wash rooms. Higher temperature between 71°C to 90°C account for the majority of a hospital's hot water requirements including physiotherapy, kitchen and cafeteria requirements.

Laying and distribution of the water supply system shall be according to the provisions of Indian Standards IS:2065-1972. Cold and hot water supply should be run in concealed form embedded into wall with full precautions to avoid any leakage and seepage. Following needs to be kept in view:

- The temperature of hot water supplied to the surgical and similar departments should be regulated between 40°C to 44°C.
- Drinking fountains should project out from the wall rather than be fully recessed. It is useful to have both hand and foot operated controls.
- There should be an arrangement for emergency cold water supply, which, on the failure of normal supply can be turned on.

3.5.3 Sanitary Equipment

The nature of the work in hospital generally, and in the surgical and similar departments particularly, demands a very high standard of hand cleaning. Washing should always be done in running water. Warm water-approximately 32°C to 39°C is more comfortable than either hot or cold. In public facilities provision of only fixed temperatures water at approximately 43°C could be considered.

Wash Basins

The comfortable working height, when standing, can be set to about 96 cm, with the water source at about 10 cm higher. If the wash basin is used by both standing and sitting persons, the basin height has to be lowered to 80 to 85 cm. Wash basins used by wheelchair patients should preferably be kept at a height of 80 cm, and be 69 cm deep.

Water Closet

In the patient areas there is a general tendency to move in the direction of providing greater privacy for all personal hygiene functions. There should be no water closet without a wash basin. Containers for paper seat protectors as well as soap and paper towel dispensers should be provided. Grab bars next to water closet are some times needed.

3.5.4 Life Safety and Emergency Power

Life Safety

There is general agreement that smokes kill in hospitals more patients than flames do. A complete life safety system would include a fire rated construction, an early warning detection of smoke and fire to block the passage of smoke and confine the fire to its room of origin; an automatic sprinkler protection, a division of each floor into at least two areas or compartments, smoke control facilities, and a trained staff.

The main functions of a detection and alarm system are to alert staff to the malfunction or hazard and to enable staff to move to a place of safety. All diagnostic and therapeutic units must be connected to the Central hospital alarm system.

Emergency Power

When the hospital is suddenly plunged into darkness at the failure of mains, the major problem is probably the psychological shock. Few life support systems are fully dependent on main electricity. All life supporting facilities shall be provided with a general emergency power supply.

There are areas in which availability of emergency power is essential. The surgical department with its delivery section and post anaesthetic recovery area, and the intensive care units, come first. Heart, lung machines, lung ventilators, operation room lighting, pumps, apparatus & monitoring equipment should be connected to the emergency power supply which on failure of normal supply is automatically switched on. Also the laboratory should be connected to the emergency power system, all its loads that are essential for safety and preservation of research data.

Lighting in treatment rooms in the radio therapy units should be provided also the emergency power. Radio cobalt machine must be designed and installed to switch off in such an eventuality.

The function of safety lighting in other areas is to enable essential movements of staff and patients and to assist safe, unobstructed means of escape. Safety lighting is essential in all parts of the hospital.

It is desirable that one lift in each separate section of the hospital should be normally connected to the emergency installation having automatic change over facilities. These lifts, should be suitably indicated by markings at each landing. Suitable manually operated switching arrangements should be provided for other lifts to enable the standby supply to be switched from the emergency lift to each of the other lifts in the group in turn to eliminate the possibility of occupants being trapped.

In the operation department, the operation room light should be switched on within a half second in case of power supply failure, other equipment within 15 seconds. The degree and quality of emergency lighting should be equal to that of the normal lighting. Ample socket outlets connected to essential circuits should be available for portable light fittings to be used for tasks outside the critical working area which require a higher standard of lighting e.g., recovery.

The switch over the emergency power supply should be indicated on a control panel in the duty engineer's office. A local battery with about one hour capability should be automatically connected to provide uninterrupted power supply. Most batteries operate upto three hours. They are easily maintained and for installation upto 20 KW relatively in expensive. Measures shall be taken that batteries of a special emergency power supply will be recharged from essential circuits.

3.5.5 Communication System

Hospitals rely heavily on Communications. While hospitals have sophisticated medical equipment, less attention is often paid to the communication system. The communication system within the hospital and outside has an immense effect on patient care. This involves a number of subsystems, namely,

- Public address system to cover whole hospital
- Music system to provide piped music to selected areas

- Staff paging and calling system
- Telephone and intercom
- Close circuit television and master antenna television

Most of the above systems require an extensive network of cables and wires to be laid in conduits. This calls for detailed planning to locate the master control room, outlet points and routing.

Telephones and Intercom

Telephone facilities for internal and external calls are required in consulting rooms, nurses room, appointments and reception room, and for ambulance drivers. Connections to the hospital telephone exchange are also needed for duty rooms, changing rooms and staff lounges of the units belonging to the medical performance area.

There are voice communication systems (intercom) on the market which are especially adapted to the internal communication routine in hospitals. Use of these systems increases efficiency and improves safety for the patients. By intercom you communicate quicker than by telephone, you are more available, both for patients and for colleagues, and at the same time the telephone is free for external communications.

3.5.6 Medical Gases, Piped Air and Vacuum

Of medical gases only Oxygen (O_2) and Nitrous Oxides (N_2O) are used in quantities that justify a piped supply economically.

Supply pipes from the gas centre should terminate with self-locking stop valves. Gas outlet points shall be at least 20 cms from electrical components which, correctly used or in case of a fault, could generate sparks.

Gas should be released only when an apparatus for its administration is connected to the valve. Plug in for similar rapid connection plugs must be used. Gas connections must not be interchangeable. Gas pipes must be identified by colours according to national or international standards. Anaesthetic gas termination points should be clearly marked. Piped oxygen and other gases require the installation of warning lights to indicate when the bank reserve reaches a critical level.

Piped oxygen, nitrous oxide and compressed air are needed in the intensive care, therapy units, in all-anaesthetic rooms, operation rooms, plaster rooms and recovery rooms. X-ray screening rooms in the radiology department may require piped oxygen, nitrous oxide and suction. Alternatively mobile equipment may be provided.

Vacuum is used throughout hospitals in patient treatment areas, in laboratories, in the surgical, recovery and intensive care areas. It serves to remove fluids from incision and body cavities and is used in post operative's drainage. In the laboratory it is used for filtering, cleaning delicate apparatus and transferring fluids from one container to another.

Vacuum is generally supplied by two or more vacuum pumps operating through a suitable receiver. It is probably a much-abused service in the hospital. Frequently it is used for purposes for which it was never intended, such as anti pollution units on anaesthetic machines.

The use of hospital piped medical vacuum systems, though feasible, introduces several problems. They should not be used with flammable anaesthetic agents. Anaesthetic agents are soluble in pump oils.

Compressed air tubes or the installation of central compressors are required. Compressed air must be filtered and dry condensation moisture must be drawn off from the pipes. To obtain a reserve of air and a drying effect simultaneously, an air tank could be used. This reserve may provide a safety margin during power failures. The compressed air installation must not be placed in a room together with oxygen and nitrous oxide containers.

3.6 GENERAL STANDARDS FOR DETAILS AND FINISHES

- Hospitals with an organized emergency service shall have the emergency access well marked to facilitate entry from the public roads or streets serving the site. Other vehicular or padestrian traffic should not conflict with access to emergency station. Access to emergency services shall be located to incur minimal damage from floods and other natural disasters.
- Rooms which contain both tubs, shower and or water closet for important use shall be equipped with doors and hardware permitting emergency access from the outside. When such rooms have only one opening, the doors shall open outward or in a manner that will avoid pressing a patient who may collapsed within the room.

- The minimum door size for in paticnt bedrooms shall be 110 m wide and 210 m high to provide clearance for movement of beds and other equipment like mobile x-ray unit. Doors to other rooms used for stretchers and or wheel chairs shall have a minimum width of 80 cm. Door width and height shall be the nominal dimension of the door leaf ignoring projections of frame and tops. For that matter 10 cm. for width and 5 cm for height may be added to arrive at the door way opening.
- Patient rooms or suites intended for 24 hours occupancy shall have windows that can be opened from the inside to vent noxious fumes and smoke products and to bring in fresh air in emergencies. Operation of such windows shall be restricted to inhibit possible escape or suicide.
- Dumbwaiters shall not open directly into a corridor or exit, but shall open into a room with a fire resistance rating of not less than one hour.
- Thresholds and expansion joint covers shall be flush with the floor surface to facilitate the use of wheelchairs and carts. Expansion and seismic joints shall be constructed to restrict the passage of smoke.
- Mirrors shall not be installed at hand washing fixtures in food preparation areas. nurseries, clean and sterile supply, scrub sinks, or either area where asepsis control would be lessened by hair combing.
- Floors and walls penetrated by pipes, ducts and conduits shall be tightly sealed to minimize entry of rodents and insects. Joints of structural elements shall be similarly sealed.
- Ceilings, including exposed structure in areas normally occupied by patients or staff in food preparation and food storage areas, shall be cleanable with routine house-keeping equipment. Acoustic installation and lay in ceiling, when used, shall not interfere with infection control.
- In operating rooms, delivery rooms for caesarean sections, isolation rooms and sterile processing rooms, provide ceilings that contain a minimum number of fissures, open joints or crevices and minimize retention or passage of dirt particles. Wall finishes for such rooms shall also be free of fissures open joints, or crevices that may retain or permit passage of dirt particles.
- In psychiatric patient rooms, toilets and seclusion rooms, ceiling construction shall be monolithic to inhibit possible escape or suicide. Ceiling mounted air and lighting devices shall be security type. Ceiling mounted fire prevention sprinkler heads shall be of the concealed type.

3.7 PREVENTIVE MAINTENANCE PROGRAMME

Prevention is Better than Cure

The responsibility of upkeep and maintenance of hospital and engineering services, premises and structure including its elements mainly rest with engineering department and governing

body of the hospital. The responsibility of the hospital administrator is, however significant both morally and legally. Under the hospital administrator major department heads including chief engineer are delegated a considerable amount of responsibility.

To reduce rather avoid the chances of occurrence of engineering hazards, it is essential to chalk out a preventive maintenance programme and also appoint a hospital safety committee to look into its strict implementation. Following aspects needs to be part of the programme.

- Selective use of music, with adequate concern for patient comfort.
- Ensure patient control of light within their territorial space, access to unfiltered day light for long term patient.
- Select warm or cool colour appropriately to activity level intended to space.
- Maintain an optimal thermal condition for patient and staff.
- Ensure periodical change of filter to provide the correct level of temperature and humidity control.
- Periodical cleaning of air-conditioning ducts system through a specialist contractor preferably by deploying compressed air technique.
- Restore frequent cleaning of floors with devices like vacuum, mopping, brushing, machine cleaning, chemical cleaning, waxing or so on related to usefulness of flooring material related to function.
- Maintain high hygienic standards for walls and ceiling. Repainting and cleaning schedule must not hamper the working efficiency of adjoining area.
- Shielded surfaces must be checked and repaired against any damage or leakage to ensure radio frequency interference-proof environment and elimination of Electro magnetic interference.
- Effective working of builder's hard ware of doors and windows must be assured through periodical checks. Self closing device must work smoothly, emission of any sound in its working should be at once eliminated.
- Glass pans must be kept clean through an easily accessible means for cleaning. Broken glass must be replaced. Brushing up, not picking up of broken glass pieces is recommended.
- Building must be frequently inspected for loose slate, bricks, stone, plaster etc, Such repairs under no circumstances be delayed or kept in abeyance.
- Where there is a variation in floor level, sufficient illumination at all hours must be provided.
- Elevator call button's shall not be activated by heat or smoke. Elevator doors should strike within a minimum impact and should promptly reopen.
- Occurrence of rust, damp conditions, stagnation of water, leakage and seepage, corrosion, scale formation in water supply system should be avoided through periodical inspection.
- Water course must be dechlorinised, overhead tanks cleaning and good maintenance practices must be adhered to.
- Regular cleaning of cooling towers be undertaken. Water droplets produced by fans within the cooling tower should not be allowed to result in contaminated situation.
- Patient toilets must be cleaned at least twice a day to safeguard against risk of cross-infection.
- Gas connections must not be interchanged. Piped gas fault must immediately be attended.
- Avoid mechanical or physical pressure on cables, which may deform insulation and may reduce its ability to withstand voltage pressure.
- Select properly and lay cables on trays to achieve high reliability over voltage surges and over heating of joints and terminals.

- Ensure smooth and proper working of circuit breaker mechanism.
- Electrical equipment must not be connected to the outlet points with loose leads or bare ends of wires.
- To one out-let point, only one equipment should be installed.
- The capacity of the out-let point and connecting wires must be matching to take the specifled load of equipment to be connected.
- Heating appliances, light and fans must be switched off when any room is to be locked or left unattended.
- All the electrical appliances, equipment must be properly earthed.
- All electric, water supply, air-conditioning and other services involving use of plants and machinery must be maintained to remain good working conditions through periodical checks regular upkeep and proper maintenance drive.

3.8 LET US SUM UP

In this unit you have learnt about the factors of hospital planning and design, physical environment, constructional elements and materials, hospital installations providing support engineering services and general standards of concern. Neglect of these elements and services at the time of planning, execution, up-keep maintenance will result to engineering hazardous conditions.

Further you learnt that hospital engineering services installations which are considered to be life line for a hospital building needs proper attention in their siting, their network of distribution system through a well coordinated planning and construction system. And also these services include electric and power supply, water supply, sanitary equipment and plumbing, heating ventilation and air-conditioning, medical and laboratory gases, traction, telephone and communication system, life safety fire protection and emergency power etc. You have also learnt that any dislocation, wrongful planning, disruption and failure of any of the services will prove to be hazardous. You have also learnt that direct contact with potential electrical source, damp conditions, rusty, stagnant, leakage, seepage, corrosion, scale formation and micro biological growth in water supply, accumulation of thick coating of fluffy dry deposit on the inside of air-conditioning duct truncking and transmission of infection via ventilation system, non compliance of piped gas supply norms, occurrence of leakages are few of the hazards and these can be avoided through well planned system, effective maintenance programme and appropriate cleaning procedures.

3.9 ANSWERS TO CHECK YOUR PROGRESS

Check Your Progress 1

1) Design of hospital premises should meet fully the health services requirements with least amount of hazards. Building must be sufficiently flexible and robust to respond to changes in technology, demand and patterns.

2) Single high rise building makes the service fully non-functional in the event of accumulated risk from disasters and is also adversely subjected to natural disasters.

3) Design soundness conditions are:

   a) To be serviceable under normal loading including fire and floods.

   b) To survive minor emergency loading on account of designed high wind, earthquake etc.

   c) To survive extremely severe emergency loading of near miss blast, hurricane or major earthquake.

4) The salient aspects of disaster safety worth considering in design of building structure are: Fire, Flood, High wind and earthquake.

Check Your Progress 2

1) the light

2) green, blue, voilet; blue, green; red, orange.

3) sounds

4) 21° C, 23° C

5) steady source

Check Your Progress 3

1) Variable elements to be considered in selection process are mainly related to use base such as friction need, indoor - outdoor use, nature of area, durability, surface quality need, method of cleaning to be employed and special traffic need.

2) Wall material in the high hygienic standard area like operation rooms should be hard, robust, impervious, jointless, non absorbent, easily to clean and decontaminate.

3) Interference requiring shielding are:

   a) Electro-magnetic interference,

   b) radio frequency interference,

   c) emission of radiation by use of radiology devices,

   d) exposure to nuclide in nuclear medicine, and

   e) magnetic field in MRI

4) Door for radiographic/fluoroscopic examination room shall be light leak proof, shielded by sheet lead, automatic closing type, 120 cm wide and 215 cm high.

Check Your Progress 4

1) Main causes of failure of electric supply are:

   a) moisture penetrating through cable sheath,

   b) mechanical damages like abrasion, crimping, embrittlement etc.,

   c) physical presure on cables deforming insulation,

   d) carelessness during laying of cables, and

   e) short circuit.

2) Damp conditions often found in neglected water supply ares because bacteria causing legionnaires disease live in damp conditions any where, but do best in water that is warm, rusty and stagnant.

3) Desirable working height for wash basin for,

   a) standing use is 96 cm,

   b) standing cum sitting use is 80 to 85 cm, and

   c) use by wheel chair patients is 80 cm.

4) Measures which must be kept in view in piped gas supply systems are:

   a) supply pipes to terminate with self locking stop valves,

   b) gas out let to be at least 20 cm away from electrical out let,

   c) gas pipes must be identified by colours according to national standards.

Check Your Progress 5

   a) out ward, collapse

   b) directly, room

c) sterile supply areas, hair combing

d) interfere, control

e) monolithic, suicide

UNIT 1 ORGANISATIONAL ANALYSIS

Structure

1.0 OBJECTIVES

After going through this unit, you should be able to:

- describe the organisation, objectives and functioning of a hospital/health institution;
- enumerate the core variables contributing to organisational effectiveness;
- identify the important factors responsible for effectiveness of an organisation; and
- analyse the interaction of core variables and factors responsible for organisational effectiveness of a hospital/health institution.

1.1 INTRODUCTION

In this unit of practical manual you will learn about analysing hospital/health institution as an organisation so as to know its functions, structure, type of organisation hospital management has adopted, the role and charter of duties of each of the functionaries in this organisation.

You will also learn how to bring new dimension in organisation system and subsystem in a hospital set up. You should understand that for analysis of an organisation, one should first understand philosophy, aims and objectives and then clearly formulate organisational chart to define clear hierarchy. You also need to include the functions and operational aspects of the hospital/health institution.

1.2 CONCEPT OF ORGANISATION

An organisation comes into existence when there are a number of persons in communication and relationship to each other and are willing to contribute towards a common endeavour. Thus to achieve a common purpose people form groups and pool their efforts by defining and dividing the various activities, responsibilities and authority. The important characteristics of an organisation are:

- Communication
- Co-operative Efforts
- Common Objectives
- Rules and Regulations

You will appreciate that the persons who form the organisation must be in a position to communicate with each other. Further, they must also be willing to co-operate with each other for the achievement of their goals or objectives. The objectives must be

common for which the organisation comes into existence. Lastly, rules and regulations lay down the formal structure of an organisation and also define the authority and responsibility relationship among various individuals in the organisation.

Organisation can also be defined as the framework within which the responsibilities of management of an enterprise are discharged. According to this definition organisation is recognized as a structure, which means it will be viewed as something static. But an organisation as you know is a dynamic entity consisting of individuals, means, objectives and relationship among the individuals. In this sense "relationship" or "formal organisation" is only a part of the organisation.

Human organisations are organic in the sense that various parts are interdependent. Some of the basic pillars of the organisation are individual, groups and the work. Work place is one of the most important institutions for providing human satisfactions.

Organisation has also been known as a system of communication, a means of problem solving, and means of facilitating decision making. Organisations can be viewed as a social system and as systems of a group of interacting variables.

For practical purposes organisation can be simply defined as a process of:

- Determining what must be done if a given aim is to be achieved.
- Dividing the necessary activities into segments small enough to be performed by one person; and
- Providing means of co-ordination so that there are no wasted efforts and the members of the organisation do not come in each other's way.

Organisation can not be separated from the idea of purpose and is necessary whenever two or more people must continue their efforts towards the same and even if task is short-lived. It is not an end in itself but a means to an end.

1.3 ORGANISATION STRUCTURE

Organisation as you have already learnt is a group of people working together to attain the desired objectives. People in an organisation do not start working together automatically unless they are provided with some mechanism of co-ordination and control. One of the mechanisms is the organisation structure. It reveals who has authority over whom in the organisation. It provides an invisible framework to integrate all the people working together towards a common goal. Organisation structure is essential for exercising leadership. Organisation structure provides an indispensable sort of co-ordination in an organisation. Peter Drucker suggests that the three ways to the organisational structure are:

- Activity analysis
- Decision analysis
- Relation analysis

The areas of career planning, executive development, manpower planning, etc. are the major areas, which are gaining importance in a large size organisation. This is the reason that Personnel Departments are known as Human Resource Departments with the responsibility of salary, surveys, empowerment of people and far more emphasis on Human Resource Development. You have already read about Human Resource Management in Course-1.

Individuals can give their best to the organisation, but when it comes to working together as a group or as work team they need to be educated. The large size organisations need a special emphasis on the techniques of group dynamics. The structure of an organisation stems from the detailed study and application of organisation principles. The organisations are working on Mission Statements,

defining the values of the organisation and rebuilding organisation culture, which is self-driven and motivating.

Types of Organisation

Now you will learn about various types of organisation, which are:

a) *System Organisation*

As you know the organisation is a system with multiple functions involving multiple interactions between organisation and its environment.

You must also know that organisation is composed of many sub-systems, which are in dynamic interaction with one another. It involves the study of these sub-systems in terms of group behaviour, goals etc. These sub-systems are mutually dependent and change in one sub-system affects the behaviour of other sub-systems. Finally the organisation exists in dynamic environment which is also composed of other systems and sub-systems. The multiple links between the organisation and its environment make it difficult to specify the boundaries or limits of any organisation.

Organisational systems and sub-systems in turn interact with the systems and sub-systems of dynamic environment to bring about organisational effectiveness, organisational development, organisational growth and organisational change. Thus the environment within which an organisation exists is becoming increasingly unstable because of the rapid change of technology, the expansion of economic market and rapid social and political change. Every organisation carries within itself representative of external environment. The employees are not only members of the organisation but also the members of other organisations, groups and societies.

Thus the organisation is a complex system because of the complex interactions between how an individual is inducted into the organisation trained, developed and managed and the interaction between the formal organisations and the various informal groups which arise inevitably within it. As all organisations exist in an environment, which consists of the culture and social structure of the society in order to revive, the organisation must fulfil some useful function.

The formal organisation is a system of well-defined jobs, each bearing definite measure of authority, responsibility and accountability to enable the people of the enterprise to work most effectively in accomplishing their objectives and organisational goals.

In the formal organisation, the work that each individual does is part of a larger pattern; co-ordination proceeds according to a prescribed pattern in the formal organisation. It sets up boundaries and path, which must be followed to achieve the objectives.

b) *Project Organisation*

In this approach, group of individuals possessing the required skills is organised into an autonomous unit for a particular project. Project management is carried out by a director appointed to coordinate and motivate the people in various activities. Responsibility for the project is very well pinpointed.

c) *Matrix Organisation*

It is a form of organisation, which contains both the project structure and the traditional functional structure. Matrix management provides for specialized knowledge for carrying on a number of specific projects. The disadvantage may arise because of the dual accountability of personnel involved in the project.

Organisation Structure
